The Glasgow School of Art.—The students of the Architectural Department this year were fortunate in having an opportunity of spending the annual autumn holiday in the English Borderland, a district the natural beauties and the historical associations whereof make it attractive and interesting to the architect, as well as to the ordinary tourist. Its history dates back to the time of the Romans, and the members of the party had an excellent opportunity of examining the remains of the forts of Agricola, and the best-preserved parts of Hadrian's great wall across the island, under the leadership of Mr. J. Pattison Gibson, the well-known Hexham antiquarian. The party left Glasgow for Carlisle on the morning of Saturday, 25th ult., and, on arrival, proceeded to the Cathedral, where sketching and photography were engaged in. In the afternoon train was taken to Naworth. By the kindness of the Earl of Carlisle the party was permitted to view Naworth Castle. Before proceeding to Hexham, which town the party made its headquarters, a visit was paid to Lanercost Priory. On Sunday afternoon a drive was taken, under the guidance of Mr. Gibson, through a most picturesque district. After passing the famous Roman Station of Cilurnum, and the modern residence of Chesters (from the hand of Norman Shaw, R.A.), Chollerford was reached. The remains of the Roman bridge were visited, and the homeward journey resumed, passing on the way Halton Tower, Aydon Castle, and the village of Corbridge, with its interesting church. Early on Monday morning the excursionists visited the Abbey Church of Hexham, and, later in the day, took train to Bardon Mill.

Glasgow High School Building Construction Students.—The High School Building Construction Students, to the number of seventy, on Saturday week visited the People's Palace, situated on Glasgow Green. The building comprises a double building—one, in stone, intended for the reception of pictures, sculptures, and museum purposes, and the other, in glass, for a winter garden and musical promenade. The portion which forms the frontage to Monteith Row is of three stories. On passing into the entrance hall, which is arcaded in stone, rooms branch right and left, intended for recreation and reading respectively, access being also gained by two doors to winter garden. The main staircase here leads to the first floor, which is of one apartment the full area of building, wherein the museum exhibits are to be displayed, while from this floor two separate staircases lead to the second floor, where the pictures and sculptures are to be placed. This floor consists of three apartments, the central one being under the dome, and lit therefrom, the other two being also top lighted. The whole of the walls in this building are lined with wood almost to the ceiling, which is of plaster. This wood is for the purpose of facilitating hanging pictures, &c. The winter garden, which, in addition to the other doors, is also entered from three separate points, is wholly of iron and glass, and abuts on the front building. Flower beds are to be arranged round the sides, the most of the enclosed space being floored with wood. The heating is by low-pressure hot water, a connection being also obtained for front building, while the lighting is entirely by electricity. The exterior presents a unique appearance owing to the amalgamation of the two structures. The façade is ornate and of a free Renaissance character, the end wings being surmounted by pavilion roofs, while the central feature consists of a dome which surmounts and dominates the structure. The total cost of the structure will be about £25,000.

Society of Engineers.—An interesting visit was made by a party of the members of the Society of Engineers, a week ago, to the Royal Arsenal, Woolwich. The visitors were conducted over the various departments comprising the Royal Laboratory, the Royal Carriage Department, and the Royal Gun Factories, in each of which they inspected the various operations.

Trade and Craft.

STATION EXTENSION.

The great station of the Niagara Falls Power Company is being extended 286ft., making its total length 426ft., which will accommodate ten of the 5000 horse-power units, three of which are already in place, and seven more contracted for, the Westinghouse Company supplying the generators, and the I. P. Morris Company the turbines, as before.

NEW METHOD OF COLOURING GLASS.

M. Léon Léal has brought out a new method of colouring glass by covering it with silver salt and heating it 500deg. Centigrade. On cooling it the glass is found to be tinged. When seen by light passing through it, the glass is yellow, and it is blue when seen by reflected light. Salts of gold, iron, copper, and other metals also stain glass in this way. It is possible to produce pretty decorations by the process.

ALLEGED INSECURE RAILWAY VIADUCT.

At the Penge Petty Sessions, the London, Brighton, and South Coast Railway Company was summoned with respect to its viaduct carrying the traffic to and from the Crystal Palace over the Beckenham Road, Penge, which was alleged by the district surveyor to be a dangerous structure.—Mr. Godfrey, from the Solicitors' Department of the London County Council, said the Bench would recollect that when he applied for the summons a fortnight since he stated that the Company denied that the bridge was in a dangerous state. There had been a great deal of correspondence on the subject, and he was now glad to report that the railway authorities were doing what was necessary. The work was of two kinds. There were superficial defects in the brickwork, and extensive cracks in the main arches. The first branch was well in hand, and the cracks would be taken in hand at once.—The case was adjourned for three months.

MUNICIPAL ENTERPRISE AND ELECTRIC LIGHT.

Municipal trading in the electric light business seems to be uniformly successful. St. Pancras, like Brighton and other places where similar installations have been established, claims to have made substantial profits. In the North London district the net result of the six months' trading ending June 30th last, after meeting all payments of instalments of loans and interest, was a profit on the Regent's Park station of £2040 2s. 9d., and a loss on King's Road station of £739 15s. 9d., to which was added the deficit of £800 12s. 7d. in December last, leaving a profit balance carried forward on account of both stations of £499 14s. 5d.

THE NEW GRAND CENTRAL RAILWAY.

During the past month excellent progress has been made with the Southern divisions of the Grand Central Railway. Of the forty-one miles north of Rugby to the Metropolitan Junction at Quainton Road, the earthworks are now almost completed. Practically all the viaducts have been finished, and the large bridge near Rugby, which crosses the Birmingham and Oxford Canal, is proceeding apace. The Catesby tunnel, over 3000 yards in length, has been entirely completed. The laying of the permanent way is also rapidly proceeding, while the stations at Rugby, Brackley, &c., are approaching completion.

THE PATENT GULLY CO. LTD.

It is well known that the above Company's Crosta patent surface water gullies are designed to prevent deleterious matter entering sewers, and also to seal sewer gases under all conditions; and further that the gullies fulfil their purpose very effectively. In noticing the Company's exhibits at the recent Health Exhibition, however, we inadvertently stated that in the use of the Crosta “deleterious matter can pass into the sewers.” Obviously an all-important “no” had been omitted.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARRY.—For building fifty-two cottages and twenty villas, for the Barry Windsor Building Company, Limited. Mr. A. M. Leon, architect, Central-chambers, Working-street, Cardiff. ... £18,944 Fred Robbins ... £14,070 W. H. Ingleson ... 15,180 Cadwallader & Hock-ridge ... 13,990 D. Thomas and Co. ... 15,170 Oliver Purnell ... 14,200 [All of Cardiff.] *Accepted.

[Architect's estimate, £14,780.]

BOLTON.—For sewer, forming, &c., Auburn-street (Contract No. 799), for the Corporation. Wm. Pollitt, Pool-street, Bolton. Scheduled Prices.

BRIGHOUSE.—Accepted for the erection of iron foundry, brass foundry, offices, &c., Perseverance Brass Works, Brighouse, for Messrs. T. Lister and Co. Messrs. Sharp and Walter, architects, 32, Bradford-road, Brighouse. Quantities by the architects:—

Masonry.—John Hardy, Hove Edge ... £1,130 0
Joinery.—Wm. Halliwell, Brighouse ... 210 0
Plumbing and Glazing.—A. L. Waddington, Brighouse ... 89 0
Plastering and Coopering.—J. Barraclough, Brighouse ... 93 13
Slating.—James Smithies, Brighouse ... 111 15
Ironfoundry.—James Mackrell, Elland ... 61 5
Iron Roofing.—Robert Hird, Shipley ... 245 0

BROMLEY.—For road-widening work and building a retaining wall in the Beckenham-lane, for the Urban District Council. Mr. Stanley Hawkins, surveyor:—
Mowlen and Co. ... £267 E. P. and Sons ... £805
T. Lansbury ... 864 J. Stockwell, Bromley* 774
Clift Ford ... 820 D. Brewer ... 386
*Accepted.

BROMLEY.—For sewerage and surface-water drainage, Southborough-road, and Crown-lane, for the Urban District Council. Mr. Stanley Hawkins, surveyor:—

Contract No. 1.
Peill and Sons ... £964 Clift Ford, Harlesden* ... £905
T. Lansbury ... 940 D. Brewer ... 850
*Accepted.

Contract No. 2.
T. Lansbury ... £1,810 Peill & Sons (accepted) £1,239
Clift Ford ... 1,243 D. Brewer ... 1,173

COLD ASHBY.—For the erection of a class-room at the Board school, for the School Board:—
J. A. Johnson ... £116 10 John Vesty, Cold Ashby (accepted) £99 10 6

LARNE.—For rebuilding business premises, for Mr. Patrick Gingles. Messrs. E. and J. Byrne, architects, 4, Waring-street, Belfast:—
James Finis, Main-street, Larne ... £800

LONDON.—For building boundary walls, and laying out exercise ground at the Hackney Union Infirmary, for the Guardians of the Poor of the Hackney Union. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C. Quantities by Mr. J. R. Stamp, Liverpool-street, E.C.:—
Barrett and Power ... £5,300 Messrs. S. R. Lambie
W. J. Davenport ... 4,572 & Son, Rhyll-st., Ken-
W. Shurmer ... 4,539 tish Town (accepted) £4,073
Clift Ford ... 3,990
S. Liddiard ... 3,900

LONDON.—For alterations and additions to premises Nos. 178 and 179, Blackfriars-road, S.E., for the Christ Church Library Commissioners. Mr. Arthur W. Tribe, architect, 120, Clapham-road, S.W.:—
W. E. Hill ... £1,451 Hoare and Sons, Black-
Geo. Newton ... 1,932 friar's-road (accepted) £1,890

LONDON.—For the erection of four houses and workshops Vallance-road, Bethnal Green. Mr. Charles Legg, archi-
tect. Quantities by Mr. W. Hawker:—
S. Salt ... £4,250 Geo. Barker ... £4,030
H. Dearsley ... 4,215 J. Howlett and Son ... 8,950
W. Gladding ... 4,159 Coussell Bros. ... 3,893

LONDON.—For additions to mineral water factory for Messrs. Batey and Co., Limited, Dulwich Works. Mr. F. A. Powell, architect:—
Wm. Smith ... £5,380 Peacock Bros. ... £5,231
H. Burman and Sons ... 5,315 Holliday & Greenwood ... 4,666
Wm. Hammond ... 5,303 Turtle and Appleton* ... 4,588
*Accepted.

LONDON.—For addition to mineral water factory, for Messrs. Batey and Co., Limited, Bow Works. Mr. F. A. Powell, architect:—
Wm. Hammond ... £285 Turnbull and Son* ... £272
*Accepted.

LONDON.—Accepted for pulling down and rebuilding the "Crown" public-house, for Mr. Frank Crocker. Mr. Chas. H. Worley, architect, 62, Welbeck-street, W.:—
J. Mansfield and Co. ... £16,598

LONDON.—For Drainage works, Orange Hill, Edgware, for Mr. W. Ruddock. Messrs. Pollard and Tingle, engineers, 31, Old Queen-street, Westminster:—
J. Dickson ... £262 14 F. A. Jackson† ... £214 0
C. W. Killingback ... 250 0 H. J. Crouch ... 249 7
R. W. Swaker ... 230 0 D. H. Porter† ... 197 0
H. Williams, Harpen-
den* ... 226 12 D. Brewert ... 136 10
*Accepted. †Withdrawn

LONDON.—For the erection of a bandstand and other works on the Boundary-street improvement scheme, for the London County Council:—
G. Sharpe ... £1,140 R. A. Yerbury & Sons ... £953
D. Gibb and Co. ... 1,084

LONDON.—For alterations at "The British Prince" public-house, Goldhawk-road, Shepherd's Bush, for Mr. William Acton, Mr. J. Henry Richardson, architect, 87, Finsbury-pavement, E.C.:—
Deduction if portion of granite is omitted and red Mansfield stone substituted.
Courtney and Fairburn ... £3,470 £69 0 0
Henley ... 3,587 90 0 0
H. and E. Lea ... 3,550 123 0 0
Eddie ... 3,247 80 0 0
Thos. Bendon (accepted) ... 3,126 127 7 6

LONDON.—For erecting six cottages on the Dorset Cottage Estate, Fulham, for Mr. Thomas Hoodless. Mr. F. W. Biggs, surveyor, 10, Clifford's Inn, Fleet-street, E.C.:—
H. and E. Lea ... £2,780 Randall ... £1,650
R. M. Heywood ... 1,812 Thos. Bendon ... 1,650
Holliday ... 1,740 Thorby (accepted) ... 1,440

MAILVERN.—For the erection of a tower to St. Matthias Church, Malvern Link. Mr. F. W. Hunt, architect, 30, York-place, Portman-square, W.:—
Stephens, Bastow, and Co., Ltd. ... £2,778 Broad ... £2,475
C. Hayes ... 2,677 Collins and Godfrey ... 2,420

LONDON.—For making up and paving Darlan-road (Sec. II.) and Ashcombe-street, and for pipe-sewer in Townmead-road, for the Fulham Vestry. Mr. C. Botterill, surveyor, Town Hall, Waltham Green, S.W.:—

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

NOTICE TO PROVINCIAL READERS.

The Editor of the "Builders' Journal" will at all times be pleased to receive and consider articles of a professional or technical character suitable for these pages. Papers read before Architectural bodies will also, if forwarded, receive careful consideration.

The Folk-lore of Architecture * certain hold which Architecture has upon

the popular mind and imagination is very probably due, to a large extent, to the dry and unpromising manner in which its theory has been expounded. Ignoring its essentially human origin, the lecturer and the archaeologist have between them resolved the history of the Art into an arduously tabulated system of dates. The century in which a building was constructed has been taken as the all-important fact to study and remember, instead of the purpose and requirements which called it into being; and the practice of applying the name of the reigning sovereign as a label for more easy classification has, little by little, been allowed to obscure and take the place of a patient inquiry into the customs and social status of the people, the real arbiters of the purpose and evolution of design in Architecture. The result has been to make the divergence in form and detail which obtains in the Architecture of differing countries and periods seem the result of caprice rather than, as it really is, a stern and logical adherence to the demands of necessity. The fickleness of a fashion has, to the uninitiated, been imparted to a growth based on deep conviction. Mr. Ditchfield has very properly determined not to be led into these errors. In his introductory chapter he strikes this keynote. "In the silent growth and elevation of the English people," says Green, the historian, "the boroughs led the way; unnoticed and despised by prelate and noble, they had all along preserved or won back again the full tradition of Teutonic liberty. In the quiet, quaintly-named streets, in town, mead, and market-place, in the lord's mill beside the stream, in the bell that swung out its summons to the crowded borough-mote, in merchant guild, and church guild, and craft guild, lay the life of Englishmen, who were doing more than knight and baron to make England what she is." The reader is at once aware that he is to learn of the mode of living of the English people. True to his purpose, yet with the true antiquary's amiable leaning to tradition and fable, the author tells us some of the legends which surround the origin of the earliest British towns—legends incredible and venerable, which make the founding of York and Carlisle synchronise with the reign of David in Judæa and the building of Solomon's Temple; but he does not forget to remind us that the early British historians were Kelts, and possessed of most

vivid imaginations. A reference to the Roman writers Strabo, Diodorus Siculus, and Cæsar at once dispels the visions of magnificence conjured up by the native writers. Nevertheless, it is with a positive regret that one is constrained to put aside, as spurious, the tale of such heroes as Prince Bladud, the founder of Bath, who, attempting to rival Icarus, and fly with wings of his own making to the upper regions of the air, fell and was dashed to pieces upon the Temple of Apollo in the city of Trinovantum (London). Coming to Roman times, Silchester, the Keltic Calleva, is taken as a typical example of the result of Roman tradition in building, modified by British race and climate. We are shown the political influence of Roman elegance; the tendency of the bronzes and sculptured marbles to impress the more primitive British, and incline them to respect and submit to their conquerors. It is an interesting link with the past to find that even now lines of the streets which intersected the old Roman town may be traced in the cornfields which have overgrown them. Still following the fortunes of Silchester, we see it taken and destroyed by the Saxons under Ella. The Saxons hated towns; under

In fact, every town was, as the author points out, a church town, while in the country the life of the people clustered round the barons' castles; of these there were 1115 in the reign of Stephen. Here is a description of London, written by William Fitz-Stephen, a monk of Canterbury, about the year 1174:—"The city, like Rome, is divided into wards, has annual sheriffs for its consuls, has senatorial and lower magistrates, sewers and aqueducts in its streets—its proper places and separate courts for cases of each kind, deliberate, demonstrative, judicial; and has assemblies on appointed days. I do not think there is a city with more commendable customs of church attendance, honour to God's ordinances, keeping sacred festivals, almsgiving, hospitality, confirming betrothals, contracting marriages, celebration of nuptials, preparing feasts, cheering the guests, and also in care for funerals and the interment of the dead. The only pests of London are the immoderate drinking of fools and the frequency of fires. To this may be added that nearly all the bishops, abbots, and magnates of England are, as it were, citizens and free-men of London, having their own splendid houses, to which they resort when they spend

WHITE HORSE INN, MAIDEN NEWTON, DORSET.

their dominion "York, Lincoln, Colchester, all the once flourishing centres of Roman life, tell of the same tale of mournful decline." The author finds time for numerous "snap-shots" of the life of this and other periods. There is a graphic little picture of a Saxon dancing girl impersonating the daughter of Herodias, trying to touch her heels with her head. We are shown the furniture as well as the buildings—the big Saxon bedstead, roofed like a house, the curling irons of the ladies, and even the rouge with which, like their sisters of old Rome and the present day, they heightened the charm of their dainty cheeks. It is interesting to compare the relative importance of the towns as shown by the number of the houses recorded in the Domesday Book of William the Conqueror. Norwich was by this standard three times as important as Canterbury, and Warwick stood far before Southampton; York was still the capital and seat of empire, as in Roman times; not until the twelfth century did London gain a hardly-bought supremacy. It seems almost incredible that at that time a quarter of the area of London should have been occupied by ecclesiastical buildings, and their courts and gardens. Within the walls, in an area no bigger than Hyde Park, stood one hundred and twenty churches, besides numerous monasteries, nunneries, and friars' houses.

largely, when summoned to great councils by the King, or by their Metropolitan, or are drawn thither by their own private affairs." Really this might be written and hold true of London in this year of grace and Jubilee:

'Tis curious through the course of years
How Clio's pen repeats her story.

One chapter is devoted to the tyranny of the guilds, a tyranny no less exacting and destructive of individual liberty than that of the modern trades union. When tiles began to supersede thatch as a roof covering, breaches of the rules of the guilds were punished by fines, payable in tiles; thus "one, John Bristol, was fined 2100 tiles for shaving seven persons contrary to order"—that is, 300 tiles for each offence. No doubt this severity acted as a strong deterrent to other offenders, but it entirely lacked the humour of the Gilbertian method of making "the punishment fit the crime." There is, however, more than a touch of Savoyard satire in the functions of the wakenman or Mayor of Ripon. "His duty was to walk through the whole city, and give a supper, and cause a horn to be blown by night during his year of office, at nine o'clock, at the four corners of the cross in the market place. One of the unpleasant duties of the Ripon wakenman was to make good any property stolen during his year of office, a duty which

* "The Story of Our English Towns," by P. H. Ditchfield, F.S.A. (London: George Redway, 1897.)

would make him very careful lest his city should harbour any thieves or vagabonds." The Saturday half-holiday dates from these early times. In the chapter on mediæval towns we meet Richard Whittington, Sir John Crosby, and other merchant princes, and get glimpses of their dwellings and ways of life, and even of the street pageants and processions, which did so much to give vivacity and colour to the life of the time. In the chapter on University towns there are some amusing pictures of the old University life. The students dined at ten a.m. and supped at five, and slept "four in a bedroom and two in a bed." Nor was this by any means their only hardship, for "such insolent pursuits" as bat-and-ball were things forbidden, as also dancing in chapel, or playing dice on the Cathedral altar, or marbles on the steps of St. Mary's Church. One cannot even imagine the horror of a modern proctor who should find it necessary to "take a man's name" for any of the offences. The extracts we have given will serve to show the reader the pleasant, almost gossipy, style of the book; he will find in it no illusive dates, no tedious or pedantic treatises of a technical kind. If, having read it, he should find himself but little more learned in the Architecture of English towns, he will certainly know more of the customs and mode of living which gave shape and vitality to that Architecture. He will see that those mediæval citizens—one may even say those Roman and Celtic citizens—were his own forefathers, in sympathy with him not only in blood but in thought and act; that they toiled and played, hoped and feared, just as he himself does, and that, had he lived amongst them, he could have sympathised with their difficulties and partaken of their pleasures as a member of the same family. That he should do this is no little step towards a more intimate acquaintance with the concrete forms in which their ideas were expressed, and for this reason, if for no other, we can cordially recommend this book to our readers. H. I.

AMONG the many theories framed to account for the disappearance of almost

every trace of the civil and domestic Architecture of the Egyptians, few, perhaps, are more whimsical than that explaining all on the supposition that the creative periods in the nation's history were followed by a period of unexampled commercial prosperity. The expansion of collective life under pressure of this prosperity brought with it successive alterations and improvements in the shell of the social organism; and that so swiftly that a century or so might have sufficed to efface the slow growth of unnumbered ages. And since the very essence of improvement is the substitution of the permanent by the temporary, each improvement in turn became more evanescent than its predecessor, until finally sand and desolation alone were left about the great granite tombs and temples to tell of the people who built them. Strained and fantastic as all this may appear, one cannot help feeling that there may be after all a grain of truth in it. The more so as we in our day see this same tide of commerce and enterprise submerging one by one all the familiar landmarks of the past, sweeping away with the cruel indifference of the ocean itself the storied stones, eloquent, as nothing else can be, of the history of the race. Not only our churches and cathedrals are modernised, made new and garish, but civic and domestic buildings alike of the deepest historic interest are swept away in the interests of business. Not a day passes without

news of the doom of some edifice of greater or less importance. The illustration given shows one of the most characteristic and beautiful inns of the West country, the sole feature of interest in the village it adorns; a link through long years with more prosperous times; a piece of real county history ungarbled by historians; the evidence of a time of artistic and creative activity; a document in masonry; a deed of gift to the present from the past. One would think that even as a commercial speculation it would be worth while to retain these features of interest in our barren towns. They would serve as a bait to the passing cyclist, or tempt the more leisurely horseman to linger on his way. In Yorkshire, the county of hard sense and real enterprise, this is continually done. One wishes the practice were universal. The inn, no less than the church or the cathedral, formed part of the life of the community it served. It was the common hearth of the village, the focus of interest, the centre of social existence for a wide circle of human beings. May we ask Messrs. Devenish, in the interests of disappearing England, to consider well before they decide to remove one of its most characteristic features. H. W.

ANTIQUITIES FROM WEST AFRICA.

AN exhibition of a remarkable kind has been arranged within the last few days at the British Museum in the Assyrian basement, a part of the building better known to those who attend lectures there than to the general public. The bronzes from Benin now shown have but little in common with the rest of the contents of the room, and their exhibition in such uncongenial surroundings is due only to the want of any other gallery in which a temporary display of this kind can be made. Two long screens in the middle of the room are covered with bronzes or brass plaques, about 300 in number, with figures in high relief, cast and slightly finished by tooling, which, both by the novelty of the subjects and the technical perfection of the work, are surprising evidences of the skill of the Benin native in the casting of metal. From time to time strange, fantastic carvings in ivory or in wood, and more rarely objects in bronze, have come from parts of the coast of West Africa, and all large collections have a few such pieces which could not be assigned to any of the known tribes. These we now know to have been made at Benin, as the numerous objects that have been brought home by officers from the recent expedition have precisely the same strange appearance, and are designed in the same fantastic style. Each of the plaques now shown is clearly

CAST AT A SINGLE OPERATION,

none of the details being subsequent additions, no matter how far they may project from the surface of the plaque. The only added work is the punched or chiselled pattern which covers the background of each plaque, and also in many cases patterns are punched on the figures themselves. There is only one method by which such castings can be made: that is the "cire perdue" process, which is very naturally regarded by artists as the best method of reproducing finely modelled work. To describe it in a few words, the design is executed in wax and then enveloped in fine clay or some similar body, the wax is then melted out of the hardened clay from an orifice made for the purpose, and the bronze is poured in to fill the space vacated by the wax. It will be obvious, therefore, that, if the wax original has any strong relief, or is under-cut, it is practically impossible to obtain more than one casting, as the mould has to be destroyed to obtain this. In this way were produced the finest bronzes of the fifteenth and sixteenth centuries in Europe, and to this day the Indian metal worker uses the same process in the manufac-

ture of armlets and anklets which can be bought for a few pence. That the Benin workmen were very expert in this method is fully shown by the perfection of the castings they produced. Those who cannot be enthusiastic about their Art value or their importance from an ethnological standpoint will still admit that as castings they leave but little to desire. The surface is generally clean, the lines are sharp and well defined, and the metal is used very economically, every projecting piece of any size being hollow to as great an extent as would be the case in a casting from Birmingham.

THE SUBJECTS REPRESENTED

consist principally of human figures, but there are also animals, fishes and plants, and in one case a building is seen. The human figures are mainly those of chiefs and their attendants, musicians, and others, some on horseback, others seated on stools, in all varieties of Benin costume and armed with sword and shield or with spears. But a far more interesting minority consist of men who are certainly not negroes, and in a few cases are without doubt Europeans in the costume of the sixteenth century. The best of these shows a European sportsman with his dog and match-lock gun, the match of which is shown in the casting with great clearness, as if the artist had realized how important a detail he had to represent. Another head of a European is clothed in the peculiar hood with a vandyked edge that had almost, if not quite, gone out of fashion in the sixteenth century. Apart from the panels entirely devoted to Europeans, many others, representing natives, have small figures or busts of Europeans as adjuncts, the long straight hair and civilized headgear being readily distinguishable. Another class of figures evidently belongs to some Semitic tribe, and may be intended for Arabs, though in one case at least the dress approaches very nearly to that of the European figures. All of these have conspicuously long and straight hair, and curious head dresses, which, with their weapons, may ultimately serve to identify them. Among the figures of natives are some which are deserving of special mention, notably one type in which the figure, which otherwise resembles the rest, has in place of legs two snakes, the heads of which curve upwards on either side, recalling in a striking manner the monstrous figures found upon Gnostic gems. That this has a special meaning there can be no doubt. It occurs upon several of the bronzes, and every

ONE OF THE MANY TUSKS

that formed a considerable part of the Benin spoils had the same figure repeated upon it in different ways. Whether there was at any time a link between the brutal savages of Benin and the Gnostics is a question not easy to solve. There appears to be no evidence to show what purpose these tablets served. All have been buried, the red earth still upon them shows this very clearly, and the nail holes in them prove that at some time they were fixed upon a wall; but whether they are a coherent series, or intended to be regarded as isolated pictures, there is nothing to show. The date of some of them may, of course, be considered as fairly certain. It is not probable that a figure of a European would be rendered with such an attention to detail at any period very distant from that in which the native artist saw such people. The date, therefore, of certain of the plaques is the sixteenth century, probably about 1560, and as the rest of the bronzes offer no very different characters, it is not unfair to assume that they also are of about the same period. But much remains to be made clear as to the origin of so surprising a class of objects, and a careful study of the designs may help considerably in this direction.

BRUSSELS is to have a permanent memorial of the Jubilee in the addition of a much needed chancel to the edifice of Christ Church. An inscription recording the great event of the Jubilee will be placed in the new chancel as the most appropriate memento of its elevation.

NORTHAMPTONSHIRE

BY HERBERT NORMAN.

TO the antiquarian, artist, or architectural student, no county of an equivalent size appeals more forcibly than that of Northamptonshire. To the latter it is essentially, with its many old houses and churches, a veritable Tom Tiddler's ground, where picturesque bits and useful detail may be picked up galore. Another and important consideration to the man who cannot afford much time or expense in travelling, is that these bits can be gathered frequently and easily from buildings closely grouped together. The sketch book that contains no reminder of time pleasantly and profitably spent in "the proud Beauty of the Midlands," as Northamptonshire has been so aptly termed, must surely belong to some architect residing far distant from the centre of England.

In an article of this length, and on such a county, much must be left untouched, whilst that dealt with can only be done so in a superficial and cursory manner. We have Burleigh House and the peasant Countess, well known to lovers of the late Lord Tennyson; Fotheringhay, and the ill-fated Mary Stuart; Kirby, and its associations with Queen Bess, the oppressor of the former unfortunate Queen; the buildings of Sir Thomas Tresham, of whom it is inscribed on Rothwell Market House, one of his works, "that he erected it as a tribute to his sweet fatherland and county of Northampton, but chiefly to this town, his near neighbour. Nothing but the common weal did he seek; nothing but the perpetual honour of his friends. He who puts an ill construction on this act is scarcely worthy so great a benefit. Anno Domini One Thousand Five Hundred and Seven." With such interesting personages and such buildings, to say nothing of the glorious churches of the Nene Valley, the readers of the BUILDERS' JOURNAL will understand my remark about being superficially treated; that it is not from dearth of subjects, but owing to limitation of space. Therefore, commencing with the county town, famed for its shoes and shoemakers for many years, the first object that would have presented itself (were it not now entirely demolished) to the visitor arriving by the L. & N.W. Railway would have been the old castle, situated formerly just outside the station gates, thus proving its right to be considered the godparent of the more utilitarian and less artistic successor, the Castle Station.

The Castle is described in the old records, "that it standeth hard by the west gate, and

hath a large keep. The area of the residue is very large, and bullwarks of yearth be made afore the castel gate." It was built by Simon de St. Liz soon after the Norman Conquest, and was the Council House to which Thomas à Becket was ordered to appear to answer the charge of contumacy and such others as might be made against him. All that remains of it now are a few of the old stones which formerly sheltered kings and nobles, but which, now built into a gateway, serve the same office to the proverbial blind man and loafers found hanging around the entrance of a station yard.

Walking a distance of about 300 yards, we find on our right one of the best specimens of enriched Norman architecture in the whole country, the Church of St. Peter, supposed to have been erected by one of the Norman lords of the castle. It is absolutely unique, the interior possessing detail of exceptional interest, the caps being most curiously and grotesquely carved with the heads and bodies of animals. The tower arch at the west end and the arches of the nave arcade are elaborately enriched with the chevron moulding. Externally the church presents features of an equal interest, one curious feature being the cluster of semi-column-formed buttresses at the angles of the tower, each diminishing in size at each story. A few steps further up Mairfair, and upon the same side, one of the two picturesque old houses (and Northampton boasts but two) strikes one as worthy of inspection. This house, commonly, but wrongly, called Cromwell House, was originally of much larger extent than at present—in fact, it actually adjoined the churchyard of St. Peter. It was probably built by one of the Haselrigs about the sixteenth century to serve as a town house, which the landed proprietors built to serve as a resort during the winter. The frontage at present is about 51ft., half its former extent, and contains fourteen heavily mullioned windows and three dormers carried out on corbels, which form a picturesque group amidst their very nineteenth century surroundings. The present entrance is of a more recent date, and possibly takes the place of a projecting porch, as shown on the old plans. Internally (owing to the rumour having gained currency that the titles were lost, and thus being plundered of its wainscoting, &c.), it has little of interest, if we except five pieces of tapestry of the usual colour and type frequently met with in houses of this description.

Continuing our ramble up Gold Street, we find ourselves in the centre of the town, and at the junction of the four principal thoroughfares—namely, Abington Street, Gold Street, Bridge Street, and the Drapery. Taking the latter, its present appearance scarcely agrees with two descriptions formerly given by Dr. Conant, the then vicar of All Saints, on the occasion of the great fire which raged through the town in September, 1675, and the other by De Wilde in his "Rambles Roundabout." The former describes it (the fire) as having made a noise like thunder, to the terror of all those who were near the place (the Drapery). The latter, writing when the market was held here, says of it as being unique as it is lovely, the bright green limes of the churchyard beyond, on either sides lines of stalls of all fashions buried in greenery and flowers, reminding him of Amsterdam, and, further, he says "we jot down our impressions of this picture, because for aught we know this may be the last year of its existence." Could he view it now as we do, with its busy service of trams, its traffic, electric light, and large and attractive shop fronts, what a different picture it would appear to him!

Across the market square, one of the finest in England, and in the north-east corner, we find the other old house that escaped the fire. This, except for its quaint gables, has been so modernised and barbarously painted to need little description. It was probably built by Williams of Penryhn, as we find on the front a motto in Welsh, "Heb. Dyw. Heb. Dym. Dwya Digon," i.e., without God without everything, God and enough; the initials W. E. P., and date 1595, being placed by the side of the motto. Taking a straight line by this house we come at the top of Newland to the fine old church of St. Sepulchre, one of the four remaining round churches. Again we have to thank Simon de St. Liz for the round part, which he built upon his return from the Holy Land about the beginning of the twelfth century. The tower and spire of a date about the last part of the fourteenth century form a grand and imposing pile which is scarcely likely to escape the leaves of a sketch book. The last building of interest in the town to be noticed is that of St. John's Hospital, which is now situated about the middle of Bridge Street. Leland gives his description of it as follows: "This hospitale standith within the waule of the toune, a little above the south gate," and he surmises it to have been founded

by William St. Clere, Archdeacon of Northampton, who lived at the commencement of the twelfth century. The chapel is a plain hall, at the east end of which is a good Decorated window of three lights, and at the west, as shewn in sketch, we have a fine Perpendicular window, and finely panelled door beneath.

(To be continued.)

LAST week Messrs. Bell brought out Mr. Reginald Blomfield's book on Renaissance Architecture in England. The history is very profusely illustrated by reproductions of photographs and old prints, and original drawings by the author.

The building of the new offices of the Commission of Sewers is proceeding satisfactorily and rapidly, after many delays. It is anticipated that the new building will be ready for occupation early next year. The foundation-stone was laid in January, 1895.

The first portion of St. Gabriel's Church, consisting of chancel, morning chapel, vestries, and three bays of the nave, has been opened by the Bishop of London. The church has been built to supply the needs of a rapidly-increasing suburb, and will accommodate, when completed, 950 people. The design is in the Decorated style of Architecture, and the outside facing of the building is carried out in Bargate stone, and the interior is faced with red bricks. The architects are Messrs. W. and C. A. Bassett Smith and Mr. R. Philip Day.

LIMOGES PORCELAIN.

THE United States commercial agent at Limoges devotes a recent report to an account of the history and methods of manufacture of the famous porcelain factories at Limoges. The whole development of the industry, from the discovery of kaolin at St. Yrieix to the establishment throughout the world of the name and fame of Limoges ware, has taken place in the last hundred years. In hardness, translucency, and general suitability for table and decorative uses this ware is not surpassed, and it is so much appreciated in the United States that nearly three-fourths of the total products of the Limoges factories go there. Excess of water is extremely injurious in making the delicate paste used by Limoges potters, and the different grades in the ware are frequently produced by mixing cheaper and impure clays with the true kaolin. The glaze consists chiefly of feldspath and kaolin, many makers adding a certain proportion of ground china. One of the features of Limoges ware is a total absence of lead; the excessive heat required to fire hard china would make it useless. The process of manipulating the

clay and firing differs in France from that in other countries. British and American potters make a very hard bisque and a very soft glaze, while the French reverse the order of manufacturing. The Limoges potters have made great progress in the art of firing china, and the old method, so common in other countries, was abandoned ten years ago, on account of the high price of coal and the great loss in inferior goods. The old kilns were replaced by down-draught furnaces in two stories, the lower filled with glaze ware, the upper with bisque. The system (which is described in detail in the report) is said to be more economical, to regulate the heat better, and to prevent loss of it. The decoration of Limoges ware has been reduced to a very fine art. The process of lithographing and decalcomania have replaced all hand-painting except for rich decorations and for special purposes. Small manufacturers purchase the sheets already prepared for decoration, employ girls to put the pictures on the china, and then have the latter fired to set the colours. The large manufacturers, however, make their own decalcomania sheets, work out their own designs, and control the decorations themselves. The design is cut on stone, like a chromo-lithograph, each colour having a separate stone. The colour is sprinkled in powder on the paper after it has received the impression from the stone. Some time ago much alarm was caused at Limoges by lead-poisoning from the colours. But the powdering is done under cover, glass being placed between the face of the workman and the sheet on which he is working in such a way that, while he can see perfectly what he is doing, there is no danger of his inhaling the powdered colours. A new powder is now being tried, which dispenses with the use of lead altogether.

IMPROVEMENTS AT BATH.

THE Duke of Cambridge visited Bath a week ago for the double purpose of laying the foundation stone of the Victoria Art Gallery and opening new buildings which have been erected in connection with the bathing establishment. The Art Gallery is to form the city's memorial of the Diamond Jubilee. The building will be erected from designs by Mr. J. M. Brydon, of London. The site adjoins the recently erected Technical Schools, and will with them, the Guildhall, and the new municipal buildings, form a very imposing block occupying the whole of one side of the High Street. The addition to the bathing establishment forms a very important feature in the city, and is the result of a scheme first discussed by the City Council in 1892, partly because of the necessity of protecting the magnificent Roman bath from injury by exposure to the weather, and

CROMWELL HOUSE, MAIRFAIR.

the desirability of rendering the surroundings of that bath more presentable than they had been allowed to remain from the time of its discovery. The original estimate for the carrying out of this scheme was from £40,000 to £45,000, but this was subsequently reduced, and the work placed in the hands of Mr. J. M. Brydon, who is to be complimented upon the

HANDSOME BLOCK OF BUILDINGS

which are now ready for the convenience of the visitors to the bathing establishment. The scheme naturally divides itself into two sections—the new Promenade, with its subsidiary rooms, and the treatment of the old Roman bath, each distinct in itself, but in harmony one with the other. The Promenade consists mainly of a hall 70ft. by 39ft., ceiled over in the centre by a dome 55ft. high, and at each end semi-circular domes 40ft. high. These domes are carried on arches resting on ten columns of Pavonazza marble and gilded capitals, and in the spandrels of the centre dome are figures of the four seasons. This will in future be the concert hall, the old Pump Room being devoted to the water drinkers. Corridors, with a terrace overlooking the Roman bath, run all round the Promenade, and various rooms, such as ladies' parlours, gentlemen's smoking rooms, &c., open out from them. They are adorned with columns of Devonshire marble, and are paved with black, white, and red marble. The space under the building is to be used as a museum for Roman and other local antiquities, and forms a most picturesque hall. The building is lighted throughout by electricity, and there is a hydraulic lift descending to the basement of the old Pump Room for the convenience of invalids in chairs, who may desire to use the baths in that portion of the system. Externally the

GENERAL DESIGN OF THE BUILDING

is founded on the Architecture of the west front of the old Pump Room, the aim of the architect being to produce a simple and dignified building, depending for its effect on the harmony of its proportions, the refinement of its detail, and its agreement with the Architecture to which it forms an addition. Very much more difficult was the treatment of the great Roman bath. It was at first intended that it should be roofed in, but eventually it was determined to keep it open to the sky, and the model adopted was that of the atrium of a Roman

house. The bath is in a hall, some 110ft. by 68ft., and on each side of the water stand the remains of the piers which carried the vaulting of the roof. The external walls have been carried up from the Roman walls, and Doric columns placed on the piers round the bath carry a flat roof over the scholæ. Over the columns on the east, south, and west sides stand statues of eight of the Roman Emperors and Generals engaged in the conquest and occupation of Britain; they are the work of Mr. G. A. Lawson. The exterior treatment of the Roman bath is simple, nothing being introduced to mar the quietness of repose which should mark the surroundings of one of the most interesting remains of the Roman occupation in Britain.

SCOTCH PRISONS.

BY ALEX. BLACK.

A "NORTHERN ATHENS" daily had a paragraph referring to recent demolitions of some of these quondam prisons at Penicuik (*i.e.*, the hill of the cuckoo), an ancient burgh of barony ten miles south of Edinburgh. The paragraph stated that the demolitions had revealed walls 11ft. 6in. thick, which excited our curiosity in consequence of the known archaeological remains in the neighbourhood, some of which are referred to presently. The report of the discovery of such thick remains we fancied would have some curious or mysterious archaeological import. Their situation, however, on the North Esk river bank leads to the conclusion that they are more probably the remains of abutment foundations for ancient water-wheel power on the river. Ancient flour mills are known to have existed here, and, on the same site, paper mills were built in 1709, by the printer to Queen Anne. The paragraph also referred to the discovery of a method of "curiously simple and effective ventilation of the attached infirmary, that is worthy of the attention of students of sanitary science." The curiously simple and effective ventilation of the imaginative representative of our northern contemporary consisted of wooden boxes of 12in. by 4in. cross section. These boxes had one side perforated with auger holes, which were placed underneath the ceiling of the infirmary. There happens, however, to be no obvious means of egress for the foul air, or of ingress for pure air, except

through small, barred, glassless windows which were shut up in cold weather. It is to be hoped that there is a less dubious system of ventilation adopted at the present time for the military infirmaries of the country. The prisons referred to went under the name of Greenlaw, although some of the buildings were at Penicuik and others at Glencorse, each of which were some distance away from the Greenlaw Mansion, which was first converted to this purpose by the Government. The situation was selected because of the contiguity of the Glencorse military dépôt, drafts from which were utilised to garrison the series of prisons. The locality of these quondam prisons, which lies S.E. of the picturesque range of the Pentland Hills, possesses varied interests. Besides its being the first location of cotton mills in Scotland, it is the seat of the largest local aggregate of the paper manufacturing industry in the kingdom, and of the most extensive individual concerns in the country. The locality of Penicuik possesses a valuable fossiliferous limestone that is capable of taking the fine cut and polish of marble, also freestone and whinstone, or porphyritic greenstone. The latter is a volcanic rock, known petrographically as diorite, a crystalline granular compound of felspar and horn blends. Ironstone mining is an important local industry. The structural work and repairs of the paper mills employ a foundry and saw mill. Chalybeate and petrifying springs are plentiful. To the archæologist, however, the Penicuik district will afford much interest, as there are

INTERESTING OLD BUILDINGS AND RUINS

of several old castles, vestiges of Roman causeways, and encampments, towns, and villages. Penicuik House is a mansion of Grecian Ionic character, and contains a considerable quantity of Roman antiquities. Many of these are from Antoninus' wall, a Roman rampart from the river Clyde to the Firth of Forth, and also from the camp at Netherby, an important Roman station in Cumberland. Amongst the archaeological remains in the locality to be noted are the extensive ruins of Brunstane Castle. There is a large, strong fortalice of about the year 1580, thought to be the ancient habitation of the predecessors of the Earl of Dumfries. Terregles Tower occupies an eminence; it is said to have been the ancient seat of the original proprietor of the parish. Logan House, which shows remarkably thick walls, with small, narrow windows, and is associated with various ancient incidents, was a favourite hunting seat of the Scottish kings. The remains of old Ravensnook was a royal hunting box. All of the ancient ruins and buildings referred to were built of the stone found in the parish of Penicuik.

CROMWELL HOUSE, MAIRFAIR.

STUDENTS' WORK AT KING'S COLLEGE.

KING'S COLLEGE has long been known for the practical nature of its instruction, and its reputation will be, if possible, enhanced by this year's exhibition of students' work in the departments of Architecture and building construction.

For those who had not the privilege of visiting the exhibition on Thursday last, the names of Professor Banister Fletcher and his accomplished sons will be a guarantee that at least precept and, what we are told is better, example, are not wanting to the pupils who attend the classes here; if it must be said that this year has discovered no architectural genius, we may at least affirm that the results do credit to the excellent teaching.

In a report, which was at once modest and cheering, Mr. Fletcher gives an outline of the work of the classes during the past year, and is able boldly and successfully to compare it with its predecessors. There are two tests, he says, which may be applied to the results, and from both he emerges triumphant. The first test is that of the members attending the classes and lectures, among which may be mentioned the architectural studio and lectures on architectural history, established this year—of which more anon—building construction, and quantities. The attendance of individual students was this year ninety-one, showing an increase over last year of twelve, and over the season of 1894-95 of twenty.

To the above figures must be added forty-one students in the wood-carving classes, so that Mr. Fletcher's verdict of "thoroughly healthy" may be heartily endorsed.

The second test which Mr. Fletcher applies is that of results in examinations, and in this, perhaps the more severe of the two, the issue is no less satisfactory. Lack of space alone prevents us from giving the results in full. We need only mention that three appointments have been obtained as Government surveyors, and that no less than 87.5 per cent. passed the examination of the Surveyors' Institution. Success has been no less marked in the examinations of the Royal Institute of British Architects and Science and Art Department at South Kensington. In the latter they are able to show one honour and three advanced firsts.

In the City and Guilds Institution, again, the pupils are well to the fore with honours in more than one subject. In this second test, therefore, we may safely say the result does credit both to the pupils themselves and the staff of teachers, which includes, besides those we have mentioned, Mr. James Bartlett, M.S.A.

In the lectures on Architectural History, which are a new feature in the course of study, and are held in connection with the London County Council, Mr. Fletcher combines historical examples with a demonstration of their excellence and utility from the point of view of the practical designer, a system which cannot fail, in his hands, to be at once serviceable and fascinating.

The free scholarship, which is the gift of the Carpenters' Company, was won this year by Mr. A. C. Remnant, while Mr. C. J. T. Dadds proved an adversary of very nearly equal merit.

The drawings which were on exhibition, if not of any striking originality, show great care in draughtsmanship, the best foundation for the production of really good designs, which can only be the result of study and experience. Our central illustrations represent excellent specimens of measured work from the hand of Mr. Wiles, and in the text we have designs by Mr. Drake and Mr. John Gough for the same subjects—viz., a dormer window and a pair of wrought iron gates. Both are treated by Mr. Drake in a dignified yet simple style, and though Mr. Gough shows more spirit in the one, he is lacking in that quiet feeling which distinguishes his fellow-student's conception of the other.

Among others which were particularly noticeable, Mr. Zimmerman shows a good drawing of Norrey Church, near Caen, carefully executed, but some of his other drawings

DESIGN FOR DORMER. BY J. GOUGH.

are scratchy. With increasing confidence he will make a good draughtsman.

Mr. H. C. Bishop has some delicate pencil drawings of ornament, while Mr. Pain's drawings are careful, but are wanting in "cleanliness."

A very careful drawing is that of Beverly Minster, from the hand of Mr. W. G. Trew, his mouldings having all the character of the Early English period. Even better are his sheets of Gothic mouldings and details, including characteristic gargoyles of St. Andrew's Church, Heckington. He is inclined, however, to be finicking in small scale work.

A Norman door, by Mr. C. W. Beaumont, is carefully and accurately drawn, but his details show an extravagance in the use of lines, which will disappear with the study of good examples. Neat drawing is the chief point in favour of Mr. French's screen, but his ideas show little originality.

Very noticeable, too, is a collection of drawings and diagrams by Mr. Fletcher and Mr. Bartlett, the benefit of which will no doubt be fully reaped by the students.

While passing through the rooms we noticed in an unobtrusive position Mr. Banister F. Fletcher's delightful little drawing in chalk of a Norman cap, which is most effective.

Architectural and constructional models are plentiful throughout the building, all of the greatest use to the young student, including, as they do, representations of the best classic examples. In the studio, recently installed with the electric light, was shown a collection of drawings forming the probationary work for the Institute examinations.

Of these works Mr. E. F. Knight's drawing of classic ornament is remarkable for its accuracy and sympathy with the subject, while Mr. Bishop's study of architectural orders is no less deserving of notice. These latter drawings have gained the bronze medal, the award of which, we may assume, was by no means easy to decide.

The architectural side of King's College has been able to signalize this year in a truly remarkable and lasting fashion. By the munificence of the son, Mr. J. Oldrid Scott, F.S.A., the collection of drawings by the

celebrated Sir Gilbert Scott, have been presented to the College. This acquisition is due in no small degree to the energy of Mr. Fletcher and Mr. Weatherly, F.R.I.B.A., not the least gifted of Sir Gilbert's pupils. These drawings include works by the master hand, and also of his distinguished pupils, Mr. Street, R.A., and Mr. Jackson, R.A., and form a collection the value of which can hardly be overestimated. They were originally used to illustrate Sir Gilbert Scott's academy lectures, and have therefore proved in the past their value for the purposes of education.

The thanks of the College and the world of students in general are due to Mr. J. Oldrid Scott for again placing these designs within the reach of the rising generation, who cannot fail to profit by their study.

They will form, together with the drawings already belonging to Mr. Fletcher, and a smaller collection contributed by Mr. Weatherly, a collection which is unrivalled in any school of architecture.

The work of the College in the past is a guarantee of future progress and increased utility, and we are certain that as this institution gets better known among students, its benefit will be permanently and gratefully felt by the architectural profession.

THE site of Lord Carrington's demolished house at Whitehall is to be at once cleared for the erection of the proposed new Horse Guards and War Office departments.

THE Croydon County Council is about to apply to the Local Government Board for sanction to a loan of £40,355 for repairing, paving, and kerbing of certain roads in the borough.

ANOTHER attempt is being made to introduce Norwegian marble into this country for ornamental purposes. One of the largest clubs in Piccadilly has, it is said, already used it in considerable quantities.

THE Ottawa Government is inviting artists to send models of a Jubilee statue of the Queen to be erected on the Parliament terrace, and also of a statue of Alexander Mackenzie, the first Liberal Premier of the Dominion.

THE ART WORKERS OF T
CENTURIES.CHIPPENDALE—ARTIST CABINET-
MAKER.

IT is difficult to ascertain the origin of the use of furniture with any exactness. The earliest races, dwelling in the Orient, did not require furniture to any great extent. A lion's hide, or the skin of any other animal, thrown on a marble floor, sufficed for a seat by day and a couch by night. A similar paucity of furniture is found in Eastern dwellings even at the present day. Nevertheless, the ancient Egyptians had chairs and tables of good form and make, and to some degree the Greeks and Romans followed their example. Still, we are inclined to look for the true origin of furniture to the races inhabiting North-Western Europe—the earlier Germans, French, and English. The rigour and humidity of their climates rendered protection and comfort necessary, and where the Oriental could throw himself down on a skin, the Frenchman or Englishman, whose room had, perhaps, but a naked clay floor, cold and damp, required an elevated couch with some description of covering in the style of bed clothing. That pleasant poet, William Cowper, has sung in his "Task" the steps of the evolution of one piece of furniture—the chair. Allowing somewhat for poetical embellishment, there is little doubt that the successive steps by which, under a process of "artificial" selection, a three-legged stool became an arm-chair, are correctly detailed.

"Those barbarous ages past, succeeded next
The birthday of Invention: weak at first,
Dull in design, and clumsy to perform.
Joint-stools were then created: on three legs
Upright they stood. Three legs upholding
A massy slab, in fashion square or round.
On such a stool immortal Alfred sat,
And sway'd the sceptre of his infant realms:
And such in ancient halls and mansions drear
May still be seen, but perforated sore,
And drill'd in holes, the solid oak is found,
By worms voracious eating through and
through.
At length a generation more refined
Improved the simple plan; made three legs
four,
Gave them a twisted form vermicular,
And o'er the seat, with plenteous wadding
stuff'd,
Induced a splendid cover, green and blue,
Yellow and red, of tapestry richly wrought
And woven close.

* * * * *
"Now came the cane from India, smooth and
bright
With Nature's varnish: sever'd into stripes
That interlaced each other, these supplied
Of texture from a lattice work, that braced
The new machine, and it became a chair.
But restless was the chair; the back erect
Distress'd the weary loins, that felt no ease;
The slippery seat betray'd the sliding part
That press'd it, and the feet hung dangling
down,
Anxious in vain to find the distant floor.

* * * * *
"But elbows still were wanting; these, some
say,
An Alderman of Cripplegate contrived:
And some ascribe the invention to a priest,
Burly and big, and studious of his ease.
But, rude at first, and not with easy slope,
Receding wide, they pressed against the ribs,
And bruised the side; and elevated high,
Taught the raised shoulders to invade the ears.
Long time elapsed or e'er our rugged sires
Complain'd, though incommodiously pent in,
And ill at ease behind."

The furniture of the Middle Ages was excessively heavy and clumsy. If anyone desires to form a fairly accurate idea of the "run" or general style of it, he should look at the Coronation Chair in Westminster Abbey. Of this ancient piece of cabinet work a former Lancaster Herald writes:—"King Edward's chair, commonly called 'St. Edward's Chair,' is a very ancient chair of solid hard wood, with back and sides of the same, variously painted,

in which the Kings of Scotland were constantly crowned; but being brought out of that kingdom by the victorious prince, King Edward the First, in the twenty-fourth year of his reign, anno. 1296, after he had totally overcome John Baliol, King of Scots, it hath ever since remained in the Abbey of Westminster, and has had the honour to be the Royal chair, in which the succeeding Kings and Queens of this realm have been inaugurated." Although made for a Royal chair, it is certainly a rough specimen of wood-working. Indeed, it was not until the great revival period that really light and tasteful furniture began to be manufactured. The French cabinet-makers most certainly took the lead in the movement; but long after exceedingly elegant furniture had been produced by these, the English workmen were still content with their clumsy and heavy patterns. It was the subject of those few lines—of whom, by the way, exceedingly little is really known—who first gave to English cabinet-making the impetus towards artistic and tasteful models, which has still survived among admirers of old fashions and furniture and Art connoisseurs, and which is also the reason which induces me to consider Chippendale as a typical artificer, and one justly entitled to be mentioned here. The name of the founder of the furniture which still bears his title was Thomas Chippendale, and about the middle of the eighteenth century he is found established in St. Martin's Lane, London, as a fashionable cabinet-maker and upholsterer, that portion of London being more patronised by the *haut ton* than it is now. He shortly afterwards issued his celebrated and magnificent work, "The Gentleman's and Cabinet Maker's Director," which, rich in plates, has nothing to say of its author, and even now it is one of the most rare and valuable handbooks in the world. This magnificent work contains an extensive collection of his exquisite designs for furniture

and decorations of all kinds, the whole forming a grand storehouse, from which all subsequent Art-workmen have freely drawn. In fact, the young Art-worker or cabinet-maker cannot follow a better master, and this must serve as my excuse for penning these few lines.

W. N. B.

THE rebuilding of St. Michael's church tower, St. Albans city, which was pulled down some fifteen months ago to make room for a more imposing structure according to the scheme of Lord Grimthorpe, the well-known restorer of St. Albans Abbey, has now been completed. St. Michael's Church, built on the west side of the ancient St. Albans city, is nearly 1000 years old, and is one of the most remarkable ecclesiastical buildings in England by reason of its antiquity and associations. The foundations under the tower are purely Roman. Sir Gilbert Scott maintained that the church is the original Basilica of Verulam, altered for Christian worship, but records state that the Saxon Abbot Ulsenus founded it in A.D. 948. The massive piers, semi-circular arches, and almost complete absence of ornaments, point undoubtedly to Saxon origin; it is more ancient than any remaining part of St. Albans Abbey. In the interior were once large family pews, some with fireplaces and fire-irons in them all complete. The carved pulpit dates from the time of James I. Apart from all other sources of interest in this ancient church, one stands pre-eminent: it is a shrine, the "Stratford-on-Avon" of Baconians. The chancel contains a white marble statue of Bacon, Lord Verulam, and Viscount St. Albans. The great philosopher is represented seated in his Chancellor's robes. Not far from the church the interesting remains of Bacon's house may be seen. Inserted most peculiarly in the south wall of the chancel is a tomb said to be that of a Crusader.

DESIGN FOR DORMER. BY W. DRAKE.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

October 20th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Broadway Theatre at Deptford is nearly finished. The builders are now completing

applause." We have still only too few statues that satisfy at once the artist and the general public, and only too many that ought to satisfy neither. But our sculpture has made immense strides of late years, and Mr. Onslow Ford is one of those to whom we are most deeply indebted for the change. When he, and others who are his worthy associates in craftsmanship and in aims, have laboured long enough, we shall be ripe for a revolt against the abominations of bronze or marble which still cumber the ground of the capital—to go no further. The Cobden statue at Camden Town is nothing less than a public calamity, as a sort of perpetual endowment of the degradation of public taste. The Burns, the Brunel, and the John Stuart Mill of the Embankment are nearly as bad. The Napier and the Havelock of Trafalgar Square are fit only for the melting-pot. They will reach it all the sooner for the elevation of public taste by such works as the one recently unveiled at Birmingham.

MR. ALMA-TADEMA, as one whose life is wrapped up in Art, was not slow to recognise that the London County Council, however prosaic may be the bulk of the work it is

the work of the School appears in the October number of the Architectural Review.

"THE Paris Charity Bazaar Fire and its Lessons," is the subject of the paper to be read by Mr. Edwin O. Sachs, before the Architectural Association, on Friday. The paper will deal not only with technical facts regarding the construction of the fatal building, and include particulars of the fire, but will be fully illustrated by views of the structure taken before and after the conflagration, copies of the contractor's drawings, and other details which Mr. Sachs has brought over from France. The policy of the architect in generally trying to oppose or avoid regulations governing buildings will be dealt with, and the policy of the architect in saving his clients a few pounds, and thereby incurring a moral responsibility of much of the annual loss of life, will also be treated of. Among those who have been invited by the Association to attend the meeting, with a view of participating in the discussion of the subject, are Mr. Thomas Blashill, the architect to the L.C.C.; Mr. Roberts, of the L.C.C. Theatres Committee; Mr. William Archer, the critic

DESIGN FOR WROUGHT IRON GATE. BY W. DRAKE.

the tower, with its copper dome, and the interior of the building has been handed over to the decorators, who have a small army of workmen engaged in fitting the fibrous plaster and other decorative work.

PLANS for the new Coronet Theatre, Notting Hill Gate, are completed. The building, which will have a continuous frontage of 130ft. to the High Street, will be constructed entirely in white stone, with a circular grand entrance at the corner, and surmounted by a tower capped (as in the case of Deptford) with a copper dome. The style is "Louis XVI.," and the building, there can be no doubt, will be a beautiful addition to the High Street. The shops now on the site will be cleared away early next month, and building operations will commence immediately after.

MR. ONSLOW FORD's statue of Dr. Dale was unveiled at Birmingham "with unbounded

called upon to perform, is entitled to respect for what it seeks to accomplish in the fostering of a love of things artistic among those who avail themselves of the educational facilities it affords. The Central School of Arts and Crafts in Regent Street, which is under the direct control of the Technical Education Board, has not long been in existence, but it has done enough to warrant the encomiums that fell from the lips of the distinguished Royal Academician on the occasion of the first exhibition of the summer works of the Art Scholars' Sketch Club. Art, sculpture, architecture, modelling, silversmiths' work, engraving, enamelling, chasing, bookbinding—these are among the things embraced in the scheme that elicited a tribute from Mr. Alma-Tadema, who urged the students whom he addressed to go on and seek guerdons in those realms in which they had chosen to walk, remembering always that "as the sun colours the flowers, so does Art colour life itself." An article on

as representing the public; and several of the leading Fire-Brigade Officers.

BLACKFRIARS BRIDGE is being re-painted after an interval of nine years. It is receiving a coat of purple oxide, while the decorative parts are being what is termed "mock-bronzed." By this term imitation gilding is to be understood. There are from sixty to eighty men on the work. The re-painting will take three months, and the astonishing quantity of paint used is twelve tons. The last two re-paintings were carried out by the present contractors, Messrs. Harrison and Spooner, in 1876 and 1888. The cost is borne by the Bridge House Estates Committee.

THE first of a series of stained-glass windows has been placed in the nave of the Royal Holloway College Chapel at Egham. The window has been executed from the designs of W. J. E. Reid, pupil of Sir W. B. Richmond,

by Signor Gastano Meo. In the upper lights of the window two angels are represented with instruments of music in their hands, their faces looking to the east. St. Augustine, as the first Bishop of Canterbury, and St. Alban, the martyr of Verulam, are figured in the lower lights. The head of the former is a portrait of the late Archbishop. The bordering is a successful adaptation of the oak, while the lunette is richly decorated with olive. The effect of the whole window is rich and impressive both in design and execution.

BRITISH antiquaries who know Codrington Priory, near Berwick, will be glad to hear that its present owner has taken steps for the preservation of the ruins, which represent one of the most ancient monastic establishments in the kingdom. The monastery was established by St. Abb in the seventh century. The buildings were once of great magnificence and extent, but of late years they have become greatly dilapidated. In taking down a tower at the south-west corner some years ago a skeleton was found standing upright in a hollow of the wall.

note of colour in "Market Place, Laroche;" "Spring, Tangier," and "Country near Tetuan" are sincere as well as pleasing. Mr. W. Strang's "Cloudland," and "The Scour," sombre and strenuous in handling, are noteworthy. There are works also by Mr. G. F. Wetherbee, R.L., Mr. W. H. Bartlett, and other artists.

THE subsidence of a huge block of buildings in the City, owing, it is believed, to the tunnelling operations now being conducted by the City and Waterloo Subway Company, has drawn prominent attention to the dangerous side of the system of subterranean railway communication which is now being so actively prosecuted in the Metropolis. In the case under notice the settlement was trifling, but on investigation it was found that the course of the work underground was distinctly traceable for a considerable distance along the line of route by cracks in the buildings immediately above the tunnels. This is a matter of no little gravity. It may be, of course, that the precautions taken against subsidence have not been so thorough as the circumstances

water therefrom. We remember many similar instances. About thirty years ago the walls of a house in Old Broad Street were warped and cracked, necessitating considerable repairs, caused by some deep excavations that were made in the street for new sewers. A large house in King William Street was also considerably damaged by the works of the underground railway which runs from the City to Stockwell, and here and there along the route of this line similar damage could be seen to other property. The injury to the building in the present instance being checked, will, most likely, proceed no further. But now that London in future will, in all probability, be honeycombed by deep underground railways, the question is raised whether so many of the clauses in the Land Clauses Act should be expunged or amended in the Special Acts authorising such railways, and owners of houses on the line of route of these railways be liable, from time to time, to have their property taken or damaged without payment or compensation. We have always been taught, until the legislation of recent years, that a man's property in his land extends from

DESIGN FOR WROUGHT IRON GATE. BY J. GOUGH.

THE Clifford Gallery in the Haymarket, in addition to Mr. Dudley Hardy's drawings, has now a bright little collection of oils, prominent among which is Mr. Frank Brangwyn's "Waiting for the Fishermen," a group of figures on a pier-head. The day is boisterous and showery, with a "lumpy" sea, and the artist has painted the weather with the *verve* habitual to him. There is the right note of feeling in the attitude of the figures, and the truthful rendering of a class of subject of which Mr. Brangwyn has made himself a master inclines one to forgive a tendency to mannerism, perhaps a little too self-assertive. Mr. Aubrey Hunt's scenes in Morocco are crisp, and he has not yielded to the temptation of dealing in violent contrasts of light and shadow to which painters of sunny lands are prone. The "Sand Mill—Tangier" has an effective bit of wind swept sky behind a dark fringe of trees on an upland. There is a mellow

demanded, but it looks as if the authorities at St. Paul's Cathedral were not so very far wrong when they opposed the line from the City to Shepherd's Bush because they feared that it might disturb the foundations of the Cathedral. However that may be, the incident is disquieting, and it will probably have the effect of putting some check upon the enterprise of the company promoters who are intent on honeycombing the ground below the central districts of London with railways.

REFERRING to the threatened subsidence in the City, Messrs Norton, Trist, and Gilbert write: "Sir,—This fresh instance of damage done to property by underground railways should draw general attention to the unsatisfactory state of the law on this point as at present administered. The subsidence is no doubt caused by the weakening of the support of the soil by the temporary draining of the

the sky to the centre of the earth. Without passing any opinion as to how far it may be expedient to allow public bodies to acquire these powers in the public interests to the injury of the private individual, it surely should not be permitted for private companies for private gains to acquire or damage their neighbours' property without compensation. When each company appeals to Parliament, the public are strangely inactive in protecting their rights. It is only some such occurrence as above that, too late, opens their eyes."

MEMORIAL work is now one of the chief trades both in English and Foreign yards, and the mason gladly avails himself of any wrinkle to enable him to produce a fine finished piece of work. Perfect smoothness in a marble memorial is really the essential point; not only does the work show up better, but the material weathers better. Not many letter cutters

know the secret of finishing a leaded inscription. Emery dust and felt sometimes does wonders, but has the effect of darkening the marble; the latest and best method is really a very simple one. Instead of emery, try "Brookes' Soap" and felt. It will leave the epitaph in lead as perfect as possible, and the marble white and smooth.

THE secretary of the Central London Railway writes to say there are twelve miles of tunnelling to be completed in connection with the new Central London Railway, and of these over six miles have been excavated. The contractors are proceeding with the work at a satisfactory and exceptionally rapid rate.

ON Saturday week the Talycafn Bridge across the River Conway was opened. The newly-erected bridge, which takes the place of the ancient ferry crossing, dating back from early British times, has been a long-felt want. The new bridge is erected in the most picturesque part of the Vale of Conway. The length of the bridge between the abutments is 353ft.; each side span is 90ft. in length, the centre span is 150ft., and the lowest headway above high water is 18ft. There is also a land span of 20ft. over a public road on the Carnarvonshire side. The piers and abutments are built of limestone, backed with concrete. The columns are of cast-iron, filled with concrete. The width of bridge between parapets is 24ft. Under the footway are carried water-mains to supply Llandudno from Dilyn Lake. The bridge was erected from the designs and under the superintendence of Messrs. Dawson and Fyson, of Westminster, Mr. Richards being the resident engineer. In excavating the foundations of the bridge, an old copper token was found a few feet under the river-bed. This is really a token which commemorates the first iron bridge built in England, on the River Severn, at Colbrooke, and is dated 1779. It thus establishes a link between the oldest and the youngest metal bridges in England.

THE collection of Roman inscribed stones in the Hunterian Museum, Glasgow University, has long been renowned as throwing much light upon the history of the Roman occupation of Scotland. In the first half of last century many of the terminals, altars, and military landmarks found in the neighbourhood of the famous Wall of Antoninus Pius between the Clyde and Forth, were presented to the University, and deposited in the library. This collection has been gradually increased since its first formation, and it is now one of the most representative of its kind in this country. Dr. James Macdonald, F.S.A. Scot., is furnishing a description.

RUSKIN'S Oxford lectures on landscape, which are now about to be published for the first time, group themselves under three heads. They deal with outline, with light and shade, and finally with colour. It used to be said of Ruskin that he slept with £15,000 worth of Turners in his bedroom. Some of these are reproduced in the book, and it will have at least one sketch by himself. This is a drawing of the Gneiss Rock in Glenfinlas, done at the time Millais was painting Ruskin's portrait.

THE members of the County Council have before them for consideration this week the estimated cost of the improvements authorised by Parliament last session. These include the new street from Tower Hill to Prescott Street, for the better accommodation of the traffic over the Tower Bridge, which is estimated to cost £219,000, with a possible recoupment of £2500; the Holywell Street improvement, for which the estimate is £546,130 for property and £23,000 for work, making together £569,130; and the Tottenham Court Road improvement at Bozier's Court, which is expected to cost £52,000 for property and £1860 for works—together £53,860. These three improvements involve the question of "betterment," a contingency not taken into account in the estimates. In connection with the remaining four, the

question does not arise. They are the widening of the Goswell Road end of Old Street, which is to cost £193,000—for property £175,000, and for works £18,000, with a probable recoupment by sale of land of £29,500; the Long Lane and Tabard Street improvement in Southwark, which is estimated to cost £207,400, with a recoupment of £17,000, reducing the net amount to £190,400; the Battersea Park Road improvement, the estimate for which is £20,930, with a recoupment of £500—one-fourth the net cost of this (£20,430) will be paid by the Battersea Vestry; and the Holloway Road improvement, the net cost of which will be £8550, one-half of this amount to be paid by the Islington Vestry. Together the gross expenditure on these improvements is estimated at £1,272,270, and the net cost, deducting the local contributions, £1,198,665.

THE South Wales Art Society's autumn Exhibition is being held at Cardiff. A feature of the Exhibition is the remarkably large number of small paintings, ranging in price from 15 to 20 guineas, and these will undoubtedly demand a much more ready sale than the larger and more unweildly which on previous occasions have been more numerous in proportion to the total exhibits. This year the exhibits number nearly 500, and the most casual observer cannot fail to be impressed by the wonderful variety in subject that the paintings afford. No one will grudge Sir E. Burne-Jones pride of place. In one of the small rooms will be found some of his early work in pencil and crayon, and in the water-colour room will be found some more mature work that will stand long and careful study. "The Images in the Wall of Idleness" is in the artist's most characteristic style. The work is, of course, decorative, but it is pure Burne-Jones, and the figures of Hate, Felony, Covetousness, Avarice, Envy, and the rest stand forth and appeal irresistibly to the on-looker. Among other artists represented are Mr. Edwin Harris, whose fine picture, "The Crucifixion," will be found in the long gallery above the dais. Mr. Edgar Bundy, R.I., has a picture that is certain to attract a deal of notice, "Barnaby Rudge before the County Justices." Mr. R. Wane, Mr. Arthur Meade, R.B.A., Mr. E. W. Waite, R.B.A., Mr. Creswick Bodell, A.R.C.A., Mr. Hamilton Marr, A.R.C.A., Mr. Lionel Walden, Hon. Stephen Coleridge, Mr. George Cockram, Mr. W. Holman Hunt, Mr. Geo. Harrison, R.C.A., Mr. John McDougall, R.C.A., and Mr. Parker Hagarty are all represented, while Mr. Walter Crane shows a charming specimen of his quaint decorative Art. Mr. H. W. B. Davis, R.A., shows a delightful landscape, with cattle, entitled "The First Breath of Autumn."

MESSRS. MACMILLAN, the well-known publishers, are to leave their old address in Covent Garden in the course of a few days, and take up their home in a handsome new building, specially built with a view to their requirements. Situated in St. Martin's Street, a turning out of Leicester Square, the new building occupies the site of one of the old galleried inns, one or two examples of which are yet to be found in out-of-the-way corners of the metropolis. It stands in the centre of a neighbourhood to which many literary, artistic, and scientific associations cling. Almost opposite the main entrance of the building is the house occupied by Sir Isaac Newton between the years 1710 and 1725. Hogarth served his apprenticeship in a neighbouring street, and afterwards resided in Leicester Fields, nearly the only portion of which now remaining is the Square. Messrs. Macmillan's new premises make a handsome block, in the building of which due regard has been paid to artistic taste as well as to utility. Oak has been used to line the walls of the main rooms, such as the Board-room and the Directors' rooms, and the result is a suite of rooms of the most handsome appearance. Old-fashioned high mantelpieces, with great spacious fireplaces, are the features of the chief rooms, and the whole fittings give an idea of stately comfort. The character of the building may be imagined as one enters the door and finds a

wide main staircase of oak, lighted by means of a high window, which, with its stone mullions, iron casements, and leaded glass, might have done duty in some old English hall.

BERLIN proposes to erect a fine statue of Prince Bismarck on the Koenigsplatz, right in front of the Imperial Diet. The sculptor who has won the competition for the best design is Professor Reinhold Begas, the same artist who executed the equestrian monument to "William the Great." Professor Begas, freed from the Imperial craze of allegory, has produced, in this instance, a much simpler sketch for the projected statue than the ponderous and over-elaborated memorial of William I. Some time, of course, must elapse before the statue can be raised on the selected site.

THE art of casting bronze is very ancient; one cannot tell how ancient, though the bronze age appears to have been preceded by a copper age in Egypt, if not in other parts of the world. Casting bronze at a single jet, however, only dates from the end of the seventh century. An earth mould was used for large bells, a sand mould for general work, and a wax mould for fine work. Sand is open to the objection that statues have to be moulded in pieces and fitted together. Wax, on the other hand, permits of casting in one piece, but is expensive, and has other great drawbacks. Quite recently, however, M. Le Bourg, a Frenchman, has introduced a gelatine mould which appears destined to supplant wax.

THE Corporation of Birkenhead, having recently acquired the site and ruins of the ancient Priory within the borough, is now taking all necessary steps to preserve the remains of the buildings, and to arrest the obliterating hand of time in its endeavours to sweep away the very interesting relics. The work of repair has been placed under the supervision of the venerable antiquary, Mr. Edward W. Cox. The members of the Historic Society of Lancashire and Cheshire were recently conducted over the ruins by Mr. Cox. Among the discoveries which have recently come to light are several fragments of delicately carved stonework, some beautiful tiles with an incised vine pattern, and many fragments of ancient glazed pottery, jugs, drinking cups, and jars, some stone mortars for grinding corn, and an interesting Norman tombstone, which shows signs of having been successively used as the base of a stone screen, as a more recent tombstone, and finally as part of the pavement. A gold coin of the reign of Edward III. has also been found, and a Nuremberg token. One of the most interesting discoveries has been a carefully built and concealed recess running down in the thickness of the wall to the rock below, where, on some light sand, lay the skeleton of a goat in perfect preservation. This is surmised to have been "a foundation sacrifice," in accordance with the old custom.

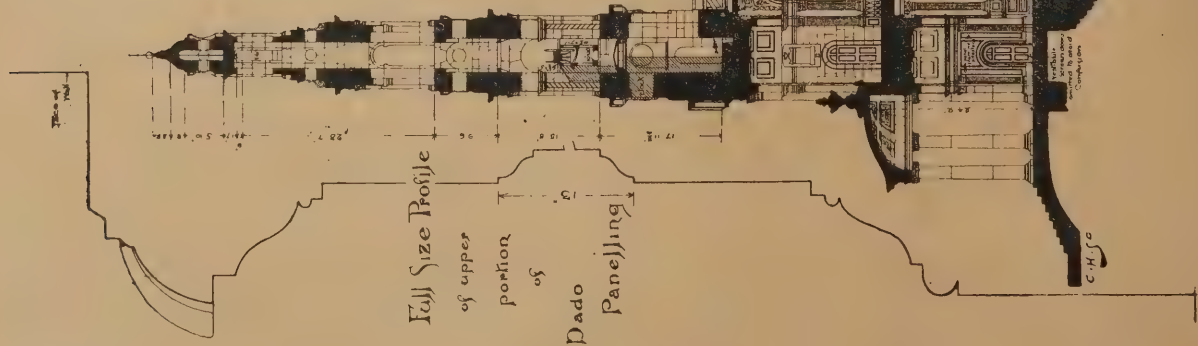

THE annual distribution of prizes and certificates awarded to the students attending the plumbing classes at the Regent Street Polytechnic during the season 1896-97, took place the other evening. The teacher's report was of a most satisfactory character. One hundred and forty students were on the class roll, and of seventy taking part in the examinations fifteen had passed in honours (one obtaining a medal and money prize), fifteen in the ordinary grade, and eighteen in the preliminary section. Eight students, moreover, had gained scholarships presented by the Technical Education Board of the London County Council. Sir Philip Magnus occupied the chair and distributed the prizes. He spoke of the value of the training afforded in the classes, which deserved the high appreciation of the public. If the British artisan maintained his present high degree of skill foreign competition need not be feared. He urged the students to pay very great attention to the theoretical portion of their work in order that the practical part might always show the highest standard of excellence.

Surveying and Sanitary SUPPLEMENT.

OCTOBER 20TH, 1897.

FILTER PRESSES FOR SEWAGE SLUDGE.*

By JAMES CROLL.

IN dealing with the disposal of water-carried sewage in inland districts, the chief consideration is the separation of the water from the solids. On the quantity to be dealt with, and the character of the district, depend mainly the most suitable method to be adopted. Where sufficient land with a suitable soil and sub-soil is available, and the situation favourable for irrigation, the sewage is frequently disposed of with advantage for this purpose, thus obviating the necessity for a chemical or mechanical process.

When, however, irrigation is not practicable, and precipitation of the solids by means of chemicals is resorted to, the sewage, after being chemically treated, is collected into tanks designed for the purpose, and allowed to settle. The clarified water is drawn off by means of floating arms and valves, leaving a muddy deposit containing a large percentage of moisture, varying from 90 to 95 per cent. of its bulk. For reducing the moisture in this residue to a condition in which it can be easily handled, various evaporative methods have been adopted, which consist of evaporation by exposure to the atmosphere, or by heat applied. The former, in most cases, gives rise to a nuisance by polluting the atmosphere of the surrounding district, and a large area of ground is therefore required, while the latter is inadmissible on account of the expense it entails in the operation. The method most commonly adopted is that of separating the water from the solids by an apparatus known as a filter press. This machine is speedy and cleanly in its operation, producing the solid matter in a portable form, easily manipulated, free from offensive odours, and, as regards cost, it compares favourably with any of the other methods in practical use.

Filter presses are also applicable to other industries where it is necessary to separate water from solids, as in breweries and chemical works. This machine is generally constructed of a number of plates having grooves for drainage on each face, communicating with an outlet at the bottom, and having a passage in the centre for through communication. It is mounted on a frame, and the diaphragms are held apart by means of distant pieces, or pins cast on, thus forming a cell between each two plates. The surfaces of the diaphragms are covered with a filtering medium, which also serves as a jointing material at the rim when the whole has been forced together, and prevents the escape of any of the matter to be operated upon. For closing the press, an apparatus is provided at one end, consisting of one or more screws, acting on a massive

plate, called the head or follower. At the opposite end is an inlet valve and pipe, through which the fluid to be treated is introduced under pressure, and it passes through the centre communication of each plate, and is distributed throughout the press. As nothing introduced can find an exit without passing through the filtering medium, on pressure being applied the water is forced through the cloth into the drainage grooves, and is discharged at the outlets at the bottom of the plates. The solids being retained accumulate within the press until the cells are filled. When this is accomplished the filtrate will have ceased to flow. The press is then opened for the removal of the accumulated solids, which are in the form of cake, varying in consistency according to the material treated. In the case of sewage sludge cake (where a

side bars, but in some cases the plates are of wrought-iron or gun metal. Where metal chambers are inadmissible, such as for the filtration of substances acting chemically on metal, wooden plates are found very useful, although they have to be worked at low pressure. As it is intended in this article to deal with the apparatus as applied to the treatment of sewage sludge only, the details of the different presses and plates in use for other purposes will not be considered.

In adapting the filter press for sewage purposes, the chief difficulty has been in designing a plate of sufficient strength to withstand the pressure on one side only without it being of excessive weight or thickness. Such a plate is necessary in consequence of the frequent stoppages of the central passage between the chambers, by reason of the fibrous matter

SLUDGE PRESS

small proportion of lime has been added to the sludge), the moisture varies from 50 to 60 per cent. Thus it follows that from five to six tons of wet sludge at 90 per cent. are reduced to about one ton of cake.

This class of machine has now been in use for a number of years, and is of various design in detail, according to the character of the work to be performed, many improvements having been made which have materially reduced the capital outlay, and added to its efficiency. With slight modifications, it can be applied to a variety of purposes; in fact, before any attempt was made to adapt it to the treatment of sewer sludge, it had been in successful operation in sugar refineries, oil works, breweries, chemical, and other works for many years. The press is usually constructed of cast-iron, with steel

contained in the sludge attaching itself to the edges of the passage, and accumulating (as it readily does) until the passage is completely blocked, thus destroying the equilibrium of pressure on opposite sides of the plates. As a pressure of 90 lb. to the square inch is frequently used on presses with 36 in. plates, and the plates have to be moved by hand twice during each operation of unloading, the impracticability of having a plate of sufficient thickness to withstand such a pressure will be readily understood.

To guard against breakage in such cases various devices are in use, notably that in which a series of bosses are cast on the surface of the plates at equal distances, which, when the plates are in position face to face with each other, come in contact, and form a series of stays, thus reducing the area of unsupported

* A paper read at a meeting of the Society of Engineers.

FIG. 5

surface exposed to pressure. (See Fig. 2.) Another method is that of giving the plate a curved section, as shown in Fig. 3. The convex side being towards the inlet end of the press, additional strength is obtained, offering the necessary resistance when a blockage occurs. In presses of small dimensions the plates are usually made straight and unsupported. In some cases they are circular in form, and, although obviously of greater strength than square plates, they are somewhat wasteful as regards cloth, seeing that an equal length must be cut off the roll for either shape. The square plates give a larger filtering surface than those of the round presses, where the diameter equals the breadth and depth of the square.

Fig. 4 shows a section of the flush plate and distance frame type. The distinctive feature of this type is that the rim is flush with the drainage surface of the diaphragm, which may be constructed either of wrought or cast-iron. The filtering medium usually employed with the cast-iron plate having a drainage surface is jute or hemp canvas. The wrought-iron plate not being provided with a drainage surface, the canvas is substituted by a thick mat of coir fibre, which by the arrangement of its strands, forms a number of drainage passages in itself, through which the filtrate passes to the outer edge of the diaphragm, where it is received into channels and conducted to the outlet.

The screw-tightening gear employed on the smaller machines is simply a powerful screw with a capstan wheel or other leverage attached, the screw acting on the centre of the follower. For large machines additional tightening gear is necessary to obtain sufficient pressure for making the joints between the chambers water-tight under pressure, and so avoid the inconvenient leaks and squirting which sometimes occur. One system of opening gear in frequent use consists of moving the follower backward or forward as required by means of an air cylinder attached to the end of the frame. A screw on each side rod is also provided, by which the final tightening is effected. Moveable distance pieces placed between the screws and the follower are also provided to allow the necessary space for opening.

The method of introducing the fluid into the press is a matter of considerable importance. Practically, there are but two systems in use for the purpose, viz., the direct forcing system, and the pneumatic or air pressure system. Were it not for the practical difficulties that are met with in pumping a mixture containing large quantities of solids of such a character as sewage sludge, the direct pumping system would undoubtedly be the more economical method, and its simplicity and smaller capital expenditure are points very much in its favour. When this method is adopted the motive power and the capacity of the pump should be in such proportions as to be capable of working at a varying speed, and equally balanced when the maximum pressure is reached, as a large

quantity of sludge is required to be forced into the press at the commencement of the charge, and afterwards gradually diminished as the operation goes on. If the motive power be in excess of the pump capacity, the pressure may rise and cause a breakdown. A relief valve may be provided, but unless it is occasionally moved it becomes set, and is not reliable.

The success of this system, however, depends mainly on the design and sound construction of the pump and pump valves; but if sufficient attention be given to screening the sewage and also the sludge before it enters the pump, the choking and slip of the valves, which usually occur, will be greatly reduced, and a steady pressure will be maintained. The pumps employed are of various forms, but the one in most common use is that of the external packed plunger type, with steam for the motive power. The plunger type is preferable as being accessible, and it can be kept tight or the packing renewed, whereas with the internal packed type the gritty substances rapidly cut the plunger and pump barrel, and excessive slip may be going on for a considerable time, as it cannot be readily detected until the pump fails to do its work or is opened for inspection. When it is considered that the load on the pump is equal to a column of water 200ft. high, and that the plungers rarely exceed 4in. diameter, the necessity for being absolutely tight is apparent.

The following is a description of the Drake and Muirhead forcing system as applied to several sewage works. It is given by the author, as it presents several practical advantages of importance.

The sludge from the precipitation tanks is received into a pit underneath the press-house, from which it is pumped to a high level agitating vat, where a small proportion of ground lime is added. From there it is forced direct into the presses by a horizontal engine

of the steam duplex type. This form of engine readily adapts itself to variations of pressure, and by the slide-valve arrangement one or other of the ports must always be open. There is, therefore, no dead point, and the engine continues to work until the pump pressure is equal to that of the steam cylinder.

The steam cylinders are placed side by side, and the one piston acts to give steam to the other, causing a movement similar to a pair of engines coupled at right angles, but with a slight pause at each end of the stroke, which allows the valves to seat without shock. For each side two external packed plungers are provided, which work into each end of a pump-cylinder having a central partition. The plungers are connected together by external rods, in such a manner as to cause them to work together as one plunger, thus, when one is filling the other is forcing, and the action is that of a double-acting pump, and gives a steady pressure. The suction supply being above the level of the pump, assists the pump-cylinder in filling, so that the engine can work at a high speed when required for charging. The suction and delivery chambers are fitted with hinged flap valves, and an arrangement is also provided for forcing them into position in the event of any large substances lodging on the seats.

The air-pressing or pneumatic system consists of running the sludge into a vessel called a ram, which is of sufficient size to contain a charge, and is provided with a dip-pipe reaching nearly to the bottom. When this vessel is charged, and the necessary valves shut, compressed air at from 80lb. to 100lb. pressure is applied to the top of the sludge, forcing it up the dip-pipe into the filter. The air may be supplied either direct from the compressor or through the medium of an accumulator, according to the requirements of the case.

An air accumulator or receiver for storage is usually provided, and the advantages of this are many when a large quantity of sludge has to be dealt with. By this means a filter with $1\frac{1}{2}$ yards of cell space can easily be filled, and filtration commenced in about thirty seconds with only a slight variation in pressure, the air compressor working at a uniform speed. As the pressing operation is nearing completion the surplus power from the compressor is being stored in the receiver, ready to be drawn

FIG. 2.

FIG. 3.

FIG. 4.

upon again when required; thus, in comparison with the direct forcing system, not only a saving of time in pressing, but also a saving in labour is effected, much less attention being required to an engine performing such work than is necessary to an hydraulic pump working with a varying load.

The addition of a small quantity of fresh lime to the sludge immediately before being forced into the press greatly facilitates the solidifying process. The time taken to produce a hard cake depends mainly on the quantity of lime used, but against this it must be borne in mind that the greater the quantity of lime used the smaller the manurial value of the cake produced.

In the Native Guano Company's process, commonly called the A.B.C. process of sewage treatment, filter presses, and the pneumatic system, are employed. The object being to produce the sludge at the highest value as a manure, the use of lime is entirely dispensed with. The cake produced contains about the usual percentage of moisture, but the time taken in pressing is approximately twenty-four hours, and a much larger filtering area has to be provided than is necessary where a small quantity of lime has been added.

The pressing plant erected at the works of the Richmond Main Sewerage Board in 1891 consists of a building with a sludge reservoir underneath, three filter presses, two pairs of forcing engines, two double-acting lift pumps, one single acting air pump, two mixing tanks, two pneumatic lime mixers, and all the necessary pipes and trucks. The building is 104ft. by 21ft., and the sludge reservoir 64ft. by 19ft., and capable of storing 2000 tons of wet sludge. It is provided with a skimmer having a perforated surface 2ft. by 1ft. 6in., and a pinion and rack for adjustment, and is connected to a 4in. pipe communicating with the untreated sludge chamber.

The filter presses are by S. H. Johnson and Co., and are erected on a platform made of H iron girders, built in the wall at one end and supported on cast-iron pedestals at the other, covered with rough surface floor plates. Each press has a capacity for producing one ton of pressed cake, the total cell space being 30 cubic feet. The plates are of cast-iron, and form thirty cells, each cell or chamber allowing the formation of a cake 34in. square, and 1½ in. in thickness. The drainage surfaces of the diaphragms are pyramid pattern, that is, the grooves or channels intersect one another at right angles. At 8in. radius from the centre are four projections which, with their counterparts, form stays, throughout the press, all the bearing parts being machine-faced true to each other.

The filtering medium is of jute canvas, cut in lengths of 6½ft., and having two holes punched. The canvas is hung over the plate, completely covering both surfaces, and the holes conform with the feed passage through the plate, around which the cloth is securely fixed by means of a quickly closing brass union, which secures the cloth effectively by a quarter turn. The arrangement for opening and

closing comprises a screw 4in. diameter, and thread of Buttress section 2½ to the inch, carried in a screw bush 8in. long, and actuated by a double purchase gear, consisting of a helical spur wheel, 3ft. 3in. diameter, geared to a 7½in. pinion, on a mandrel, to which is attached a capstan wheel, 4ft. 6in. diameter, and is of sufficient length to allow an opening of 1ft. 3in. for removal of the cake.

The two pair of forcing engines are each of the same dimensions, viz.: Two steam cylinders 6in. diameter with side valves cutting off at 0.6 of the stroke, and pumps 4in. diameter and 12in. stroke, secured to cast-iron bases, parallel to each other, and a fly wheel 4ft. 6in. diameter, weighing 15cwt. The pump plungers are connected direct on to the piston tail rods, and are single acting, working in stuffing boxes 6in. deep, packed with hemp. The suction and delivery of valves are circular in form, the guide being cast on the valve box cover, thus giving a clear opening. On the delivery main there is an air vessel or accumulator 4ft. 4in. by 1ft. 4½in.

The two horizontal lift pumps are independent of each other, with steam cylinder, 6in. diameter, and pump, 6in. diameter by 12in. stroke, secured to a cast-iron base plate, and acting without rotary motion. A link gear attached to the piston-rod gives motion to an auxiliary slide valve, which admits steam to the cylinder through the medium of a piston, to which the main valve is attached. The pump plunger, working in a cylinder, is double acting, and was originally fitted with spring rings, which have since been replaced with rope packing. This form of pump, although unsuitable for high pressure, answers sufficiently well at a low lift, as in the present case. The pump valves are of the same pattern as those on the force pump. One single acting air blower, having a steam cylinder, 4in. diameter and 8in. stroke, and air cylinder, 8in. diameter and 8in. stroke, working at low pressure, supplies compressed air for mixing purposes.

Two pneumatic lime mixers, shown at Fig. 5, are 2ft. 6in. diameter, and 2ft. 6in. deep, and are worked in the following manner:—A charge of lime in lumps is placed on the grid inside the vessel, and is sprinkled with sufficient water to slake it, and the cover of the vessel shut. After the lapse of a few minutes the valve is opened and a further quantity of water run in until the lime is completely submerged. During the wetting process a jet of air from the air-pump is admitted; it agitates the contents, and keeps the holes of the grid open. The milk of lime is then drawn off by a valve, the outlet passage being kept clear by the action of the air. In 1894 additional pressing machinery was erected, consisting of three filter presses, a duplex air compressor, an air receiver, two sludge rams, and all the necessary pipes for pressing by air pressure, and a system of pipes for ventilating the sludge reservoir and tanks. The three filter presses are of the same capacity as those put down in 1891, but they differ somewhat in point of detail.

(To be continued.)

Surveying and Sanitary Notes.

LIVERPOOL has long been conspicuous amongst cities for continuous and drastic improvements in methods of sanitation. An exact, not a rule of thumb, knowledge of sanitary science should be in the possession of those who seek to serve as the sanitary inspectors of municipalities, and in recognition of this fact a committee has been formed at Liverpool called the Sanitary Science Instruction Committee, and has arranged a winter course of tuition in matters affecting the public health, this being designed to meet the requirements of sanitary inspectors, teachers, lecturers, builders, foremen of works, surveyors, architects, and of others interested in subjects connected with sanitation. The opening lecture was delivered in the Arts Theatre of University College, by Dr. Hope. Subsequent lectures and demonstrations will be given in Ashton Hall, University College. The systematic course of lectures will embrace: 1. "Sanitary Engineering and Appliances;" lecturers, Mr. Wilding (surveyor, Runcorn), Mr. Goldstraw (deputy-building surveyor, Liverpool), and Dr. Manby (assistant medical officer). 2. "Food Inspection," "Diseases of Animals," and "Bacteriology;" lecturers, Dr. Hope and Professor Boyce. 3. "Objects and Methods of Inspection of Nuisances" and "Vital Statistics and Meteorology;" lecturers, Dr. Hope and Dr. Manby. 4. "Methods of Disinfection, &c.;" lecturer, Dr. Manby. 5. "Sanitary Law;" lecturer, Mr. E. W. Pierce (assistant town-clerk).

At the Kingston-on-Thames Borough Bench "the Mayor, Aldermen, and Burgesses of the Borough of Kingston-on-Thames" were summoned by the Thames Conservancy for allowing sewage matter to flow from one of the borough sewers into the Hogg's Mill River and thence into the Thames, and thus polluting the same.—Mr. W. S. Bunting, who appeared to prosecute on behalf of the Thames Conservancy, explained that notice to discontinue the pollution was served upon the Kingston Corporation in April last year, and that as this was not complied with a summons was issued, a sample of the affluent disclosing the fact that it was highly charged with nitrogenous and organic matter. He also pointed out that the Corporation had rendered itself liable to a penalty of £100 and a daily penalty of £50 during the continuance of the pollution.—Mr. Drummond, chief inspector of the pollution department of the Thames Conservancy, reported having served the notice, but said the Corporation had since diverted 2½ miles of surface-water drains which formerly went into the sewers and had instituted a system of night pumping at the sewage works.—A fine of £1 and costs was imposed.

THE ARCHITECTURAL ASSOCIATION.*

ITS HISTORY AND AIMS.

(Continued from page 220.)

THE Discussion Section affords opportunities for the study and discussion of those subjects and difficulties which occur in actual practice; this is a most valuable part of our work, and it is gratifying to note its continued success. A record of the Association transactions would not be complete without a reference to the special meeting held in December, 1893, when the question of the admission of ladies into membership of the Association provoked a lively discussion, and the proposal was defeated by a large majority. Since then no one has come forward to advocate the cause of the ladies, but we have, on several occasions, been reminded of the existence of such a class of students on the boards of the A.A. Soirée stage. We have now traced in outline the work and

PROGRESS OF THE ASSOCIATION

during the fifty years of its existence. There are, of course, many incidents and details that would have been interesting to enlarge upon, but on an occasion like this it would be impossible to do so. There are, too, many names that might have been mentioned as identified with the course of events, but it would be undesirable to single out a few where so many have borne an active part. The history of the Association is marked throughout its career by a fixed determination on the part of its members to maintain its independence, to uphold its traditions, to overcome all difficulties, to grapple with changing circumstances, to keep abreast of the times, to seek the counsel of its best friends, to encourage and help the young student, to provide the best training and education at its command, to keep in touch with those who have passed through the student stage, to keep alive the memories and maintain the friendship of those who have retired from active service, and above all to advance the noble Art of Architecture. May the same devotion and self-sacrifice, the same enthusiasm and loyalty, characterise the men who are entering our ranks to-day, so that the Association may accomplish in the future greater things than in the past, and heaven smile upon the works of their hands. We have been looking into the past and rejoicing in our year of Jubilee at all that has been accomplished; let us turn for a moment to the present. We have entered upon a new session with

THE LARGEST ROLL OF MEMBERS

ever recorded, viz., 1150. It may be interesting to note that of this number eleven have been members for forty years and upwards, sixty for thirty years and upwards; 110 for twenty-five years and upwards; 180 for twenty years and upwards, 302 for fifteen years and upwards, and 552 for ten years and upwards. Seven hundred and forty-eight of our present number joined before the subscription was raised in 1891, so that 402 have come in and remained since then. Various conclusions can, of course, be drawn from these or any other figures, but this, at least, may be said, that the Association has succeeded in retaining many of its best and most valued friends, who are ever ready to testify to the great advantages they have derived from its membership. On the other hand, there is a solid army of young men, many as yet untried, who are destined to take up the reins of government before long, and who have opportunities which, if wisely used, may be productive of lasting good to their own and future generations in raising the status of the Profession and in the advancement of Architecture as a living Art. There is one point in our comprehensive scheme of education which demands attention, and continues to disappoint us. While the students of Division I. attend in very satisfactory numbers on the whole (and in fact the present accommodation is somewhat strained to pro-

perly provide for them), those in Division II. are comparatively few. What becomes of those who have passed through the first stage? It is very evident that a large proportion of them

DO NOT CONTINUE THEIR STUDIES

and complete the course we wish them to follow. This is a problem that we have not succeeded in solving yet, and it suggests the advisability of making individual enquiries of those who have passed through Division I. to ascertain the causes which apparently lead them to abandon the higher and more advanced studies provided for them. The combination of practical with theoretical instruction is also a subject which is exercising the minds of many. At present, the facilities we offer our students in this direction are very limited. In the handicraft classes last session, the students were enabled to attend a course of manual training in masonry and leadwork, thanks to arrangements made by the Technical Education Board; and this session the Board has kindly arranged for a series of workshop demonstrations in stone working, to be given at the Regent Street Polytechnic. There appears to be a difference of opinion as to how far it is necessary or desirable that an architect should be able to put his own hand to the work of any trade. If it is an advantage that an architect should have actual manual experience, would it not be better that a student should be taught or apprenticed to one trade—say mason or carpenter—before he serves his articles? Such a course would seem to be the most convenient as well as the most practicable; later on he might with advantage gain considerable knowledge in other crafts, not necessarily by

HANDLING THE MATERIALS AND TOOLS,

but by observation either on works, in shops, or in craft classes; while later still the superintendence of works, either as clerk of works or otherwise, would be an experience of great practical value. After all, the years of a student are limited, and even if he should make the very best use of his opportunities, he cannot expect to accomplish very much in this department of his education. By far the most useful and appropriate thing for an architectural student is modelling, and it is a question whether this is not worth all the other crafts put together. The tendency of the times is, perhaps, to make too much of the manual work undertaken at the Technical Institutes. It is valuable as far as it goes, especially in the more scientific subjects, but it is a fallacy to suppose that it can in any degree supersede the training which an apprentice to his trade must and should acquire in the workshop, where the everyday practical problems have to be dealt with. You will have gathered from the report of the Committee for last session that it has been resolved to commemorate the Jubilee of the Association by establishing a fund for acquiring new premises, suitable and adequate for the work carried on. It would be quite contrary to the wishes and feelings of all who have the interest of the Association at heart to let so important an occasion pass without making some special effort to permanently benefit a Society that has done so much to further the cause of

ARCHITECTURAL EDUCATION,

and in whose welfare the whole Profession is concerned. Various suggestions have been made and discussed, but there seemed to be one predominant object which overshadowed all others. For the last few years the cry has gone forth for increased and better accommodation. Numerous efforts have been made to obtain premises, but hitherto without success; and, seeing that our need is as great as ever, it has been determined to commemorate the Jubilee in the way mentioned. We have sought the advice and help of friends who have aided the Association generously in the past, and they have intimated their readiness to support us again, provided we are prepared with some definite scheme. This is a most reasonable attitude, hence we are now going forward in the matter with renewed energy and determination, and are hopeful that the

way is opening up for obtaining a site on which premises could be erected to provide studios and class-rooms, library, reading-room and offices, a common room, and last, but not least, a meeting room, so that under one roof we may combine all the essential accommodation for educational and social purposes. The provision of workshops might, with advantage, be arranged in a separate building more suitable for the purpose, if satisfactory arrangements could not be made with any of the public craft schools. This outline of a scheme may seem to indicate a large undertaking, but if carried out on the lines we have in view, and which it would be premature to discuss, there is little doubt but that it could be satisfactorily accomplished. Our desire is

TO FORMULATE A DEFINITE SCHEME

that is practicable and attainable within reasonable limits and a reasonable period, not forgetting, at the same time, that it should worthily commemorate our Jubilee. The question of establishing a Municipal School of Architecture has been talked of and may yet come; but such an institution could never do the work that the Association undertakes, neither could the Association open its doors to outsiders and accept grants or subsidies from County Councils or other public bodies without sacrificing its freedom and ceasing to fulfil the objects for which it exists. It is an advantage that cannot be too strongly urged, that the architectural student should be trained in an architectural atmosphere, that he should have every opportunity of associating with kindred spirits and forming lasting friendships with them. The true spirit of comradeship will be best promoted by such intercourse, and the higher claims of Art will be more easily attained. If we would seek to stimulate the enthusiasm and fire the imagination of our fellow students, we must cultivate the love of the beautiful; we must continually strive for the advancement of our Art; our sympathies and powers must be directed to raising the standard of our attainments and keeping a high ideal ever before us. Let us go forward, therefore, with renewed energy to the duties and studies of another year, remembering that the opportunities, the advantages and privileges, which are now the inheritance of our students, have been obtained by the cordial co-operation, the self-sacrifice, the patient toil, and the brotherly love of men who, for fifty years, have joined hands in promoting the advancement of architectural education and upholding the first principles and honoured traditions of the Architectural Association.—Mr. Cole A. Adams opened a discussion, and, in proposing a vote of thanks to the President, referred to Mr. Pratt's lengthy and active connection with the Association. The speaker shared some of the views of the President as to technical education, and remarked that when they realised the enormous amount of work necessarily falling to the lot of the student, and remembered the comparatively short time in which he had to do it, they at once saw the unwisdom of devoting so much attention to the manual crafts. He instanced the great architects of the past as having failed to take up craft pursuits in detail. As Ruskin had pointed out, the imagination—the greatest quality in the making of a great architect—had to be cultivated, and this could not be thoroughly done if too much time were devoted to other subjects. In concluding, Mr. Adams acquiesced in the need of new premises for the Association, and expressed the hope that the President's year of office would be a prosperous one.—The vote of thanks was seconded by Mr. Beresford Pite. In listening to the President's address, he said, they all must have felt what a great debt Architecture in this land owed to their humble little body. It was not asserting too much to say that

WITHOUT THE ARCHITECTURAL ASSOCIATION

there would have been no architectural education; for in describing the origin of the demand for an examination, the President had described the origin of the demand for education. The constitution of the Association was a very healthy and vigorous one; it had not been hampered by Royal Charters or by gold

* Annual address of the President, Mr. Hampden W. Latt.

chains round its neck, there was a true liberality in the conservatism of the Association. Its aim had invariably been a high one, and in no period of its history had it lost sight of its object—the producing of fine Architecture. The speaker emphasized the importance of imagination in architects, classes of design were but means; they really wanted classes of observation, and classes that would excite conception in the mind; it was only by putting together the letters and phrases of an accomplished design in his mind that the architect was able to construct the work he had in hand. He emphasized the importance to students of looking at the illustrations in the building papers. The mind could accustom itself to seeing a large amount of architectural form, and unless the mind was furnished with a mass of design, a poverty of design and a distaste for it must follow. He ventured to suggest that reading and lecture studies were a healthy sign. If students continued for three or four years to give the best part of their time to hearing and cramming the pernicious of architectural education, imagination could not and would not grow. He cherished the idea that the student who had had a year's dose of reading and class lectures would desire the freedom of reading for himself, enjoying the pictures in Fergusson much more than hearing the lecturer describe Fergusson in unpleasantly short phrases.—Mr. Owen Fleming, in supporting the vote of thanks, remarked that somehow our railway stations, hotels, and Charing Cross roads were not animated by the same feeling of love and reverence that influenced the buildings of the beautiful abbeys, cathedrals, temples, and castles of the past. Many were not satisfied with present-day results, and these he imagined would, by their buildings in the twentieth century, help to make the

ARCHITECTURAL HISTORY OF FUTURE TIMES.

Remembering the character of the Architecture of to-day, he could not help wondering whether the education of architects at the Association was being conducted on the right lines. He thought that if we followed the lines of Froebel, Pestalozzi, and Herbart, we should in the twentieth century, perhaps, be able to produce buildings like the wonderful old buildings of the past. What position was the Association going to take up in regard to this movement? It seemed that it intended having nothing to do with it; that it was not going to be associated with the rest of the world; nor would it take up its proper position at the head of the Architectural school in London; yet, as the great central institution in London for the education of architects, it seemed to him that it must do so if Architecture in London were to be permanently improved. They were in keeping their schools private and surrounding themselves with a high wall of paper and books, preventing themselves and their students from executing beautiful work. He asked for the position to be honestly and thoughtfully discussed.—The vote of thanks was carried, and in reply the President said he hoped that the Association's fifty-first year might be a very successful one, and that it might continue to make good progress.—Advantage was taken at the meeting of the opportunity of presenting Mr. D. G. Driver, the assistant secretary, with a silver tea and coffee service on the occasion of his recent marriage. Although Mr. Driver had only been connected with the Association for five years, said the President, in making the presentation, he had done an enormous quantity of useful work. Mr. Driver suitably acknowledged the compliment.

PRIZE LIST FOR SESSION 1896-97:

A.A. Travelling Studentship, value £25, and bronze medal, E. H. Evans; second prize, not awarded; Architectural Association Silver Medal and £10 10s., H. Inigo Triggs; hon. mention, F. D. Clapham; Essay Prize, value £10 10s., and silver medal, Alexander Wood; The Andrew Oliver Prize, first prize, value £3 3s., not awarded; second prize, value, £2 2s., not awarded; The Arthur Cates' Scholarship, value £10 10s., H. T. Bromley; Measured Drawings Prize, value £5 5s., C. H. F. Comyn;

hon. mention, H. Farquharson; Discussion Section Prize, not awarded; Architectural Union Company's Prize, not awarded; School of Handicraft (Masonry) Bronze Medal, H. C. Lander.

LECTURE SIDE.—*Division I.*—R. H. Spalding (silver medal and certificate), A. Wood (bronze medal), A. White (hon. mention).—*Division II.*—G. S. Nicol (silver medal and certificate), H. C. Trimmell (bronze medal), E. Hale (hon. mention).

STUDIO SIDE.—*Division I.*—V. Wilkins (silver medal and certificate), T. Bee (bronze medal), R. H. Spalding (hon. mention).—*Division II.*—W. H. Ward (silver medal and certificate).

ORDER OF MERIT.

Division I.—Greek and Roman Orders.—C. Brée (certificate), H. White, J. E. Franck. *Elementary Construction and Materials.*—C. Brée (certificate and book), W. C. Butterworth, W. J. Davies. *English Architecture.*—Alexander Wood (certificate), J. E. Franck, R. H. Spalding. *Elementary Physics, Formulae, and Calculations.*—J. E. Franck (certificate and book), R. H. Spalding, H. White. *Plane and Solid Geometry.*—R. H. Spalding (certificate and book), R. C. Hall, J. E. Franck. *Mensuration, Land Surveying, and Levelling.*—J. D. Hunter (certificate), L. G. Detmar, R. H. Spalding. *Division II.—History of Architecture.*—G. S. Nicol (certificate and book), H. Badcock, S. E. Barrow. *Materials, their Nature and Application.*—H. C. Trimmell (certificate and book), H. Badcock, G. S. Nicol. *Stresses and Strains.*—G. S. Nicol (certificate), F. J. O. Smith, T. W. Aldwinckle, jun. *Construction.*—P. Morris (certificate and book), H. C. Trimmell, G. S. Nicol. *Hygiene (Drainage and Water Supply).*—F. J. O. Smith (certificate and book), T. W. Aldwinckle, jun., H. C. Trimmell. *Hygiene (Materials and Construction, Ventilation, Lighting, and Heating).*—F. J. O. Smith (certificate), G. S. Nicol, T. W. Aldwinckle, jun. *Specifications and Estimates.*—S. E. Barrow (certificate), H. C. Trimmell, T. W. Aldwinckle, jun. *Professional Practice.*—T. W. Aldwinckle, jun., G. S. Nicol, S. E. Barrow. *Elementary Class of Design.*—F. N. Reckitt (silver medal, with scholarship value £5 5s. and certificate), C. L. Brierley (bronze medal and certificate), T. F. Green (hon. mention and certificate), J. S. Lee (hon. mention).

In Central London it seems hardly possible to make any building alteration of importance without disturbing some memorial of the mighty dead, and perhaps there is no place more liable to a disturbance of this kind than Leicester Square, which is a very gold mine of historic associations. In clearing away old buildings to make room for the new additions to the Dental Hospital, the house is threatened in which Sir Isaac Newton once resided.

The new Royal County Theatre, Kingston-on-Thames, which has been in course of erection during the past six months, was opened a few days ago. The building has been constructed to accommodate about 1250 persons, and is a two-tier house, divided into orchestra stalls, dress circle, pit, and gallery, with four private boxes to accommodate sixteen persons. Special attention has been devoted to the exit doors, all of which have been fitted with a panic bolt, which, while resisting pressure from without, yields to the slightest pressure from within. The stage has been constructed to accommodate the largest productions on tour, the depth from floats to back wall being 41ft., and the clear width 46ft., while the proscenium is 22ft. 3in. wide by 23ft. high. In the decoration of the interior of the building the prevailing tints are ivory, salmon-colour, and gold, and the ceiling has been painted in the floral style, there being a large centre panel with figures. The building is lighted throughout with electricity, about 1200 8-candle power incandescent glow lamps having been brought into requisition. Ample precautions have been taken in case of fire. A connection has been made with the Lambeth Water Company's high pressure main, by means of which a copious supply of water can be poured upon the building from above in case of emergency, and asbestos gas fires will be used in the dressing-rooms.

Professional Items.

BLACKBURN.—Mr. R. C. Christie, has offered to give a sum of £50,000 for the erection of a hall at Owen's College and the completion, as far as possible, of the quadrangle. Two "friends of the College" have offered sums of £10,000 and £5000 towards the cost of erecting and maintaining new buildings for the physical laboratory. A third gift is from Mr. Edward Holt, who sent a cheque for £1500 to defray the cost of the new gymnasium.

BURNTISLAND (FIFE).—At a recent special meeting of the Town Council, Messrs. Swanston and Legge, architects, Kirkcaldy and Burntisland, submitted plans shewing the renewal of the Old Port Wall, which projects into the pavement near Waverley Buildings; the demolition of the out-houses and old dwelling-houses; and the building of a handsome two-storied block extending to the corner, and a similar frontage along part of Rose Street, which were unanimously approved of. The project is the outcome of a recent proposal by the Town Council to open up the east end of the High Street, by coming to an arrangement with the proprietor of the existing building, which has been successfully carried out, so what has long been known as "Kinnell's Corner" will undergo a complete transformation. The work is to be commenced immediately.

CARDIFF.—The foundation-stone of a new Wesleyan Chapel was laid on a site acquired off the Albany Road, Cardiff. The new building will cover a considerable area, and be of quite a different plan to that usually adopted to chapel buildings, so as to use the site to the best advantage. The main elevation will be towards Albany Road, with entrances from Bangor Street. The nave, which will be the width of the site, has a length of 78ft. by 28ft., with side aisles 10ft. wide on each side. The transepts will be 28ft. wide on each side, with aisles the same width as the nave. The only galleries will be over the transepts, with seats for about 140. The accommodation in the body of the chapel will be for about 710, with further accommodation for about thirty-five in the choir. For the present the tower will not be erected, but it is hoped that at a very early date the trustees will see their way clear to complete the scheme by erecting this. In addition to the chapel proper, the following further accommodation is provided: Organ chamber, 18ft. by 12ft.; two vestries on the ground floor, and a large parlour, 36ft. long by 19ft. wide; on the first floor another parlour 28ft. long by 19ft. wide, and a smaller class-room. Ample kitchen and scullery accommodation is provided. The carrying out of this structure forms a new era in chapel building in the neighbourhood, as the old system with ranges of galleries is discarded: in this case the nave will be quite free, with curved and panelled wood ceiling, and it is anticipated that the acoustic effect of this form of construction will be good. The contractors for the building are Messrs. E. Turner and Sons, the architects being Messrs. J. P. Jones, Richards, and Budgen.

CASTLETON.—St. Martin's Church, Castleton, the erection of beautiful stained glass in the great west window of the church has been designed, executed, and erected by Messrs. Wailes and Strang. The subject of the new window depicted is the ascension from Mount Olivet, and extends over the entire window, which is composed of four lofty lights and very elaborate tracery. The Saviour occupies the central upper portion of the window, surrounded by a company of angels; while the eleven disciples are variously grouped below, on the mountain. The figures are almost life-size and draped in rich, though unobtrusive, colours, very careful treatment having been given to their facial expressions. The tracery contains at the apex an imposing seated figure of the Christ in majesty crowned, enthroned, and bearing the orb and cross. Around this figure are depicted cherubim with instruments

of music, and the three great Archangels bearing their respective emblems. The whole appears as one picture framed in elaborate tabernacle work of architectural design. It is said to be one of the finest windows in Lancashire.

DARLINGTON.—The new Technical College recently opened will cost about £13,000. The building is a decided addition to the Architecture of the town. It is in the main thoroughfare of Northgate. The central tower ascends 80ft. from the basement, and the building itself is three stories. It has frontage to the street of about 140ft., and a like extent is covered by a wing on the south side. It has been about a year and a half in erection, the work being carried on by Messrs. Mackenzie of Darlington. The style of the building is Perpendicular Gothic, of the florid English type, which prevailed from 1460 to 1510. The vestibule is a conspicuous and ornamental part of the building. The main building is of brick, with facings, and windows of terra-cotta, and there are two fine figures representing Science and Art, 6ft. 6in. high, surmounting the building. There is, on the semi-basement, workshops for various trades, including wood-work, metallurgy, plumbing, carving, cookery school, laundry, &c. On the ground floor there is the chemical laboratory, class rooms, physical lecture room, administration room, rooms for engineering and drawing classes, optics, &c. The first floor is nearly all given up to Art.

EXETER.—The new church, the foundation stone of which was laid on Tuesday week, will consist of a chancel, with organ chamber on the north side, side chapel and vestries for clergy and choir on the south, nave, with north and south aisles and transepts and south-west tower. The style selected is an adaptation of the English Gothic of the beginning of the 15th century. The walls externally are to be built, between the dressings, in Babbacombe stone, internally in Pocombe. The dressings, window tracery, &c., are to be in Bath stone. The roofs are open-timber ones, constructed in pitch pine, and the floors throughout are to be laid with wood blocks. The windows, generally, are to be glazed with rough cathedral glass of a light shade. The heating is to be by hot water, and, on account of the dampness of the site, the chamber is arranged in an iron tank under the north transept. The ventilation is to be effected through inlets in the sides of the windows, and an exhaust ventilator in the turret over the nave roof. The extension of the transept northward, with additional entrance porch, and other slight alterations, have taken place since the first designs were made. The clerk of works is Mr. T. R. Glanfield. The building will probably occupy a period of eighteen months in erection.

LEEDS.—During the past week Messrs. Wailes and Strang have erected a fine stained-glass window in St. Clement's Church, Leeds. The design, chosen by the committee (out of a large number of designs submitted by competing firms) as being the most beautiful and appropriate, was composed of two female figures emblematical of Peace and Plenty, two fitting subjects illustrative of Her Majesty's long and prosperous reign. The canopies surmounting these figures are designed in architectural work, whilst the bases contain the Royal arms of the United Kingdom of Great Britain and Ireland. In the centre of the tracery, a quatrefoil, is a bust portrait of Her Majesty, wearing her crown; and the rose, thistle, and shamrock fill up the four foils surrounding the portrait.

LIVERPOOL.—Though no official statement has yet appeared to support the rumour of a gigantic scheme of dock improvement and extension at Liverpool, it is now ascertained that the Mersey Docks and Harbour Board contemplates the expenditure of some four millions sterling in dock developments on the Lancashire side of the river. Other central and some south end docks are to be practically reconstructed, with wider entrances, greater depth of water, and increased quay space.

The docks, opened in 1881, were constructed under Parliamentary powers obtained nine years earlier, and it may be assumed that the works now contemplated will be carried on during a series of years.

The fine offices which have been erected in Sir Thomas Street for the Liverpool School Board will not be completed and ready for occupancy before the end of the official year. The work has been pushed forward with all possible speed, but, unfortunately, as in the case of other new public buildings in the city, considerable delay has been occasioned, especially in the internal work, in consequence of labour disputes. Viewed from the street, the building presents a handsome appearance, and of late the beautiful designs with which the stonework is embellished have been greatly admired by the citizens. In addition to the civic device, and the words "Liverpool School Board Offices," prominence is given to the names of the present and past chairmen of the board, which are carved on three tablets.

LONDON.—Mr. R. Horner Hargreaves, solicitor, notifies us of a change of address. His city office will in future be 51 and 52, Aldermanbury, E.C., to where communications should be addressed instead of to 1, Mitre Court, Temple.

In the course of the next few days, the work hitherto carried on at the police station in Seething Lane will be transferred to more commodious quarters. A new police station has recently been erected at the corner of Goodman's Yard and the Minories, and has a considerable frontage in both streets, and especially in Goodman's Yard. It is a fine red brick building, with the principal entrance at the corner of the two streets, the rounded corner being surmounted by a turret. On the ground floor are the charge room, the inspector's room, and the muster room, and opening out of the latter is an apartment for the use of the detectives. Seven cells are provided, cased with white glazed brick, and lighted directly from the inner courtyard, instead of, as is usually the case, deriving their light from a passage. These cells are all heated and ventilated upon the most approved principles. In the basement are the mess-room and a large kitchen, together with the necessary offices and the coat and helmet room. The ground floor contains, in addition to the official rooms mentioned above, a reading room and a large recreation room. It is in the men's sleeping rooms that the greatest change has been made. Instead of the dormitories which are provided at other stations, every man at the Minories will have his own cubicle, a little apartment 9ft. by 6ft., each of which has its own window, and a cupboard in which clothes can be kept. There are three floors of these cubicles, and on each landing there is abundant lavatory accommodation, with a bath room. In all some 65 constables and sergeants can be accommodated at this station, in addition to a housekeeper. The building has been constructed from plans prepared by Mr. A. Murray, the City Surveyor, and the work has been carried out under the personal superintendence of Mr. T. R. W. Mossman, of the City Surveyor's office.

For some time past complaints have been made by various occupiers of premises in Queen Victoria Street of the effect which the recent operations of the City and Waterloo Railway have had on buildings in the street. The tunnel from the south side of the river has now been bored under the whole length of the street, and in many of the buildings at the eastern end subsidencies have been noticed. A crack observed some days ago in the topmost portion of a high wall in Mansion House Chambers was subsequently found to have developed to alarming proportions, while the building and frontage were seen to have perceptibly subsided. Efforts were made at once to prevent further damage by shoring up the building. A few days ago the engineers of the City and Waterloo Railway made a thorough survey of the various premises said to have been affected, and made arrangements for remedying the dangerous position of affairs.

PAIGNTON.—The new Church of St. Andrews at Paignton is built in freely treated French Gothic of the 14th century style. It is constructed of red brick burnt from clay in the parish, with dressings of Ham Hill and Bath stones. The shafts supporting the fine arcades that divide nave and aisle are of Purbeck marble, and the clerestory windows have also pillars of the same material. The roofs are hammer beam ones of massive timber covered in with red tiles. The tracery of the windows is of Flamboyant character. The floors of the nave and aisles are of wood blocking with red tiles in all the avenues and approaches. The chancel floor is of mosaic, and that of the sanctuary polished Devonshire marble. The roofs of the chancel and chapel are of oak, and that of the tower has groined stone vaulting. The stalls are of carved oak. The most imposing feature in the new building is the splendid inlaid and sculptured marble pulpit. No church in Devon contains a more beautiful one, and it is doubtful whether either the Cathedral pulpits are so richly ornate. It is of Byzantine character, reminding the traveller and tutored eye of the superb old pulpits to be found in some of the Cathedrals in sunny Italy. In the main it is made of rare and inlaid Devonshire marbles, although yellow magnesium limestone is also introduced, especially in the approach. The body of the rostrum is supported by a group of polished marble columns, and the cants are of inlaid marbles. At each angle are canopied niches in solid marble, having golden tesserae inlaid backgrounds. These niches contain sculptured statuettes in white Castellino marble. In the panel immediately beneath the preacher's desk is a carved representation of the crucified Christ, also in pure white marble. This splendid pulpit is the handiwork of Messrs. Harry Hems and Sons, of Exeter. The old font, however, has the greatest claim upon all lovers of antiquity and of the historical associations of our English Church. The old bowl is early Norman, wrought by some cunning hand in Paignton red sandstone during the latter days of the reign of King William the Conqueror. It is circular, richly carved, and ornamented by cable moulds, and that intricate kind of strap ornament which borders so near upon Celtic art. It had in the dark days that are passed been shamefully used, and at last found a resting place in a neighbouring garden, but last year it was happily restored to its original home—the fine parish church of Paignton. The first portion of the church was built by Mr. E. P. Bovey, of Torquay, and the final part by Messrs. Stephens and Son, contractors, of Exeter.

PYECOMBE.—The interesting village church of Pyecombe, at the foot of Clayton Hill, is being put into much-needed repair, and is undergoing a "conservative restoration." The work includes improvements in the seating, new heating appliances, new windows, an enlarged vestry, and other alterations. It is also intended to put stained glass in the east window, and the architects (Messrs. Clayton and Black, of Brighton) have provided for an oak memorial reredos and panelling for the chancel in their plans.

SOUTH SHIELDS.—In the principal thoroughfares of South Shields, the old brick houses, clumsily converted into shops, are gradually disappearing from view, and in their places large and stately buildings are springing up from time to time in various directions. King Street, the principal thoroughfare, has been undergoing quite a transformation during the last twenty-five years, and handsome architectural adornments have also been appearing in many of the adjacent streets. The demolition of old property to provide space for the widening of the important thoroughfares, which the Parliamentary Bill of the Corporation has given them power to carry out, will result in the replacing of many unsightly places by ornate structures that will greatly enhance the architectural attractions of the town. Mr. Farquhar M. Laing, of Newcastle, is one of the earliest to take advantage of the prospective street improvements; and in view of the

widening of Mile End Road from 30ft. to 50ft., Mr. Laing has already commenced operations in connection with his valuable corner block of property which runs from Ocean Road up Mile End Road to Stanhope Street. The new buildings are practically an extension of the premises, comprising the hall and retiring-rooms which were opened in 1891. Mr. J. H. Morton has prepared designs for the new buildings, which will consist of a handsome block in Mile End Road, immediately behind the Royal Hotel; a quantity of tenemented property, together with the old North-Eastern Hotel, has been razed to the ground to make way for the new erections. The hotel will be a roomy structure, thoroughly equipped in every department; rooms adjoining, and with large club rooms and a number of smaller apartments above. Adjoining the hotel will be erected a number of shops, extending to Stanhope Street, the floors above comprising suites of offices which will be adapted for mercantile and professional men. The whole of the new premises are being so constructed that at any future time, if necessary, they may be made to form an extension to the Assembly Hall already referred to. The buildings when completed will form a handsome addition to the Architecture of the town, and will greatly add to the beauty and appearance of what has hitherto been a much neglected though important thoroughfare. The building has been entrusted to Mr. Robert Allison, contractor.

THORNHILL.—The new church in course of erection in Thornhill is in the Gothic style of the decorated period, and the principal feature of the main gable, which fronts the centre of the street, is a large four-light window, with richly-moulded tracery head. This window lights the end gallery, and under it are two double-light windows with cusped heads. At the side of this gable is the main entrance, formed by a stone porch with a deeply-moulded arched doorway. From this porch doors open into the area of the church and to the gallery staircase. This staircase is placed in a square tower which rises at the side of the church behind the porch, and is carried to a total height of about 60ft. The lower portion is quite plain, relieved only by narrow lancet windows to the staircase, but the upper stage has four double-light traceried windows with moulded arches and hoods, and the flanks are relieved by moulded sunk panels with cusped heads. The side elevations show a series of single-light windows with cusped heads, and the hall and vestry buildings at the back are in keeping with the church. Internally, the church will be roofed in a single span, with moulded timber main couples carrying a semi-octagonal ceiling. The principal timbers will be dressed and exposed; the ceiling between these is finished in plaster. There will be a gallery at the end only, facing the pulpit, which will be placed on an open platform, having the choir on a lower platform in front. Above the pulpit is a three-light window, which it is proposed to fill with stained glass. The church is being built of red stone from Gatelawbridge quarries, and will be slated with light-green Cumberland slates. The total cost will be about £1900. The architect is Mr. John B. Wilson, Glasgow. The following are the contractors for the various works: Mason, Mr. James Cook; joiner, Mr. W. McClane; plumber and heating, Messrs. P. Drummond and Son; plasterers, Messrs. Waugh and Nish; slater, Mr. J. Corson—all of Thornhill; painters and glaziers, Messrs. A. and H. Gilchrist, Kilmarnock.

GOLCAR.—The recently-opened Board school in Crow Lane has been erected from the excellent plans and under the supervision of Mr. Jos. Berry. The school, which comprises mixed and infants' departments, has a central hall 54ft. 3in. by 32ft., and five classrooms. The school is so arranged that if the mixed department should at any time require to be enlarged, two classrooms can be added, which will provide additional accommodation for 100 children. The floors are laid with wood blocks on concrete. All the dados are of glazed

bricks, finished with a moulded capping. Rising galleries are formed in all the classrooms, which are fitted up with deal desks and cupboards. The schools are heated with hot water on the low pressure system by radiators, and all the rooms are airy and well ventilated. The names of the various contractors are: Mason, Mr. William Holroyd; joiner, Mr. William Lockwood; plumber and slater, Mr. Thos. Allison; plasterer and painter, Mr. Dan Shaw; whitesmith, Messrs. G. S. Scholefield and Son; concrete, wood-block flooring, and stone asphalt macadam, Mr. John Cooke; ironwork, Messrs. Joseph Taylor and Sons; heating apparatus, Mr. F. Milan.

A NEW NORTHERN COLLEGE.

THE new Technical College and Public Hall which have been built in West Hartlepool were opened recently. The style of architecture is Tudor-Gothic. Plain treatment has been observed, but by proportion and effective arrangement of break in the frontage a picturesque group of buildings has been secured. The Technical College is entered from Sander Street through a porch and vestibule, fitted with handsome stained-glass screens, displaying the arms of the borough. The vestibule gives access to a fine, well-lighted staircase-hall, square in shape, having wide corridors branching off right and left, the former being to the technical subject classes, comprising engineering, plumbing, and carpenters' and joiners' workshops, together with class and cloak rooms, while that to the left gives access to rooms allotted to the secretary, the committee, etc. The corridor to the left likewise leads by a branch to the physical laboratory, balance and combustion rooms, and also to the large public hall ante-rooms, or platform saloon, from which it is separated by a glazed screen partition with folding doors. Returning to the entrance hall, from the first landing of stone staircase, the chemical laboratory is entered, a fine, large room, having windows on both sides. The whole of the first floor is devoted to class rooms, and is provided with cloak rooms and a large lecture theatre, while the top floor is entirely given up to Art, the rooms being specially designed to be lighted from the north, and are all exceptionally fine, lofty apartments, well suited to their several purposes, which include elementary, antique, and life classes, geometry, drawing, &c. In the semi-basement are large storage rooms, heating chamber, &c., all well-lighted. The public hall is on the ground floor, and has no less than five direct entrances from the surrounding streets in addition to the door from the school premises adjoining, thus securing absolute immunity from crush or panic. The main entrance, which is flanked by two picturesque octagonal turrets rising above the doorway, is from Hart Road through porch and vestibule to a capacious foyer or saloon, from which retiring rooms open right and left. Glazed screens with folding doors at either end of this saloon lead to the gallery staircase of polished hard stone, while further staircases at the opposite corners, at the platform end of the hall, make together four staircase approaches with a total width of 20ft., should rapid exit from the gallery be necessary. The hall is capable of seating about 1500 persons, and is excellently adapted for the purposes required. Polished grey granite columns, with Robin Hood hard stone caps, bands, and bosses, support the gallery, and the same are continued up in cast-iron tapering shafts with gilded capitals to support the roof, which is of special construction, and gives an admirable effect of height inside. The ceiling is panelled in polished pitch pine and plastered between the ribs, while adequate ventilation is assured by large ornamented gilded openings leading to a large trunk in the roof to carry off vitiated air, fresh air being introduced by regulated openings in the side walls. The architect is Mr. H. A. Cheers, of Twickenham, and the contractor for the building, Mr. Thos. Dickinson, of Middlesbrough. The building has cost, including site and fittings, about £16,000.

THE WINTER SESSION.

"ARCHITECTURE OF THE VICTORIAN ERA."

THE opening meeting of the second half session of the Edinburgh Architectural Society was held a few days ago. Mr. J. A. Williamson, the president, gave his opening address, entitled, "Architecture of the Victorian Era," in which he sketched in outline the various phases through which Architecture had passed during the Queen's reign, bringing the history down to the latest date. The net result, the lecturer pointed out, of the architectural activity of the last sixty years was that, compared with any former time, there was a greater wealth and variety of models to select from. But, at present, a stage of architectural licence had been reached in which Gothic and classic forms and features were blended with surprising ingenuity, which the lecturer considered might defeat its own object, ending in reaction towards more archaic forms.

MATTERS ARCHITECTURAL AT SHEFFIELD.

The opening meeting of the winter session of the Sheffield Society of Architects and Surveyors was held at the School of Art on Tuesday week. The President, Mr. E. W. Fowler, in his inaugural address, said amongst other things they were desirous of securing a habitation of their own; but, so far, owing to want of funds, that had been impossible to obtain; and following that, the collecting together of a library of professional and scientific works, a commencement with which had already been made. During the past session valuable and interesting lectures had been delivered, and beyond that good work had been done on behalf of the society. The conditions of competition for School Board work were not at all satisfactory, and the council appointed a deputation, consisting of Messrs. Hadfield, Gibbs, and Innocent to discuss the matter with the Board. The result of their interview had been to obtain an increase in the architects' fee from 6s. to 7s. 6d. per head of school accommodation, and some alteration in the conditions. The Corporation made formal recognition of the society by throwing open to the members of it practising in Sheffield a competition for a Fire Brigade Station, and also appointed its officers as assessors. The conditions of the competition, which were prepared by Mr. Innocent and settled by him and Messrs. Gibbs and Hadfield, had been highly approved of by other kindred societies. On this subject he pointed out the advantage accruing to the Corporation from throwing open such competition to their body, instead of employing an architectural staff of its own, whose services could not always be in requisition, and who yet must necessarily be a permanent expense. They thus obtained the talents of practically the whole architectural profession in the neighbourhood, with very beneficial results, not only to themselves, but to the ratepayers at large. The tendency of Corporations nowadays was to concentrate the work of a town in the hands of their own body, and employ their own workmen to carry it out. That was not economical they all knew, and whether it resulted in greater efficiency was a matter of controversy. The past year had been one of considerable prosperity in the city, in which, judging by the lengths of the new roads opened out, and the number of new houses in course of erection, their profession had certainly had its share. Whether this prosperity would continue, or whether the present disastrous strike which is paralysing the engineering industry may retard it, was not wise to prophesy.—A hearty vote of thanks was accorded to the President for his address, on the motion of Mr. E. Winder, jun., seconded by Mr. J. B. Mitchell-Withers, and supported by Mr. E. M. Gibbs.

THREE places of worship in Thornton have been supplied with new organs during the present year.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

THE PRESERVATION OF PARCHMENT.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you inform me through the medium of your Enquiry Department as to the best means of preserving the old parchment documents of this borough? What is needed is a room about 5ft. square, but the problem is how to secure that amount of dryness which is necessary for the preservation of the documents.—Yours truly,

C. F. M.

Godmanchester, Sept. 9, 1897.

Your query raises two points: firstly, as to position; secondly, as to ventilation. Your first care should be to secure a suitable position, and then, if possible, to provide a simple means of ventilation. We take it that you do not literally mean a room when you speak of a place 5ft. square, and assuming that the place of storage is movable—a large cabinet, for instance—your aim would be effectively attained by raising it a few inches from the ground, and securing an inlet and outlet by making holes in the bottom and the top. In any case, ventilation is your remedy, and if this is not attainable, your place of storage is at once defective and wrongly placed. Your only expedient then would be to provide a stove or other heating apparatus. Care should be taken at the outset, however, that the parchments are thoroughly dried, as otherwise ventilation or heating would soon cause serious damage.

PUBLIC APPOINTMENTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly inform me, through the medium of your valuable journal, of the best means, to your knowledge, of obtaining an appointment as a surveyor's assistant under a public body, i.e., a District Council. I am at present an assistant in a private office. What examination do you consider could most profitably be passed as a qualification for such a post? Thanking you in anticipation—Yours truly,

"DORIC."

With the exception of Government appointments and those for district surveyors in London, there are no qualifying examinations for posts such as those you refer to, the selection being generally made from the applicants on the ground of their suitability to the requirements. The following certificates would probably assist your chances of success: Science and Art Department, Building Construction (Advanced or Honours), Hygiene (Advanced); Sanitary Institute examinations for Associate Membership and Sanitary Inspectors; Surveyors' Institute, qualifying examination. There is a very good school at Brighton in connection with the Science and Art Department. The Sanitary and Surveyors' Institutes will forward particulars of their examinations on application.

It has been decided to build a fourth asylum almost equal in size to those already belonging to the county of Lancaster. This new institution, for which a large site has been purchased, will be situated at Winwick, near Warrington. The contract for the building has just been given to Mr. Robert Neild, of Manchester, for £253,000. The electric lighting will cost a further sum of £14,000.

Trade and Craft.

THE ART OF JERRY BUILDING.

At the Wallasey Petty Sessions, Robert Kettles, Erskine Road, Seacombe, builder and contractor, was summoned at the instance of the Wallasey Urban District Council for having broken a certain bye-law governing the construction of the walls, foundations, roofs, and chimneys of new buildings, and for neglecting to cause the brick walls of eight new houses in Erskine Road to be properly bonded together. There was a further summons in respect of one of the houses for allowing the upper part of a wall to overhang the part beneath.—Mr. W. H. Travers, surveyor to the Council, stated that the walls, generally speaking, were not properly put together or properly bonded. Many of the courses were far from being horizontal, and the walls in many cases were not vertical. Many of the joints were without mortar, so that a rule could be passed six or eight inches into the wall in places. One inside party wall could be seen through. A number of photographs showing the defective construction were produced, and one of these showed four or five courses built of nothing but broken bricks.—Mr. Preston remarked that it seemed to him that there was scarcely a whole brick in the house.—Mr. Madden, for the defendant, asked that the cases might be adjourned in order that his client might comply with the requirements of the Council, but the Bench declined to take this course, and inflicted a penalty of 40s. in each of the nine cases, or £18 in all. The defendant was also ordered to pay 8s. 6d. costs in each case.

MESSRS. W. COOPER, LTD.

"Who loves a garden loves a greenhouse too"—and who loves a greenhouse and is about to carry out a scheme of erection may as an amateur be much facilitated in his project by a visit to Messrs. Wm. Cooper, Ltd., 755, Old Kent Road, S.E. We have received a copy of the firm's catalogue, and its contents and illustrations show how completely the firm's operations cover the field of horticultural providers. Greenhouses and conservatories of almost every conceivable kind are herein shown, possessing features and improvements which recommend themselves as much to the architect on account of their artistic excellence as to the practical horticulturist for their utilitarian merits. Messrs. Cooper, Ltd., show several designs of greenhouses for amateurs, and following them come plain and ornamental designs for villa and other conservatories. Greenhouses, however, constitute but one branch of the firm's many-sided activities, and its works in the Old Kent Road—the home of greenhouse builders—forms a happy hunting ground for the horticulturist who here meets with every kind of implement and object required in the garden. There is a striking variety in the catalogued collection of fowl and pigeon houses, whilst there is quite an artistic wealth about the designs for summer and lawn tennis houses. Garden seats and rustic armchairs, and, in fact, garden furniture of every description, are well represented; and in skipping the section devoted to heating and sanitary apparatus, we pass beyond the confines of the garden altogether into the more important sphere of church, school, and hospital work, for Messrs. Cooper's catalogue contains designs for iron churches, mission halls, and hospitals, not to speak of country and seaside residences (some in the bungalow style), cricket pavilions, workshops, &c. Of course, these structures recommend themselves chiefly on economic grounds, but happily economy is not secured at the expense of the design; in fact, Mr. Cooper shows that a good design is as cheap as a bad one.

A BUILDING TRADES' CONFERENCE.

A meeting of representatives of the above trades, to consider the best way in which the Craft School could supply the needs of the London building trades with regard to technical education, was held a week ago in the

workroom of the school in Globe Road, E. The chair was occupied by Mr. Llewellyn Smith, who, in his address, observed that, whatever might be the feeling with regard to the changes that had come over the country with regard to apprentices, there would be no contention as to the need of centres where workmen could have an opportunity of perfecting themselves in the various branches of their trades. The object of the classes for the building trades was for the training of workmen, and not for the amateur, for they were of opinion the two could not be successfully mixed up together. A very considerable number of workmen in the district already took advantage of them, and the object of the conference that evening was to obtain suggestions as to the best means of making the classes useful and more widely known. All the suggestions that were made would be most carefully considered by the committee, with the desire, so far as practicable, of carrying them out, so as to make the school more useful to the centre of the great building trade.—Mr. George Dew said the time had come when, as trade unionists, it was their duty to get lads to go into the classes. It was only by these the younger ones could obtain knowledge. The building trade had changed, and the title of "master craftsmen" no longer belonged to their employers. That was unavoidable in the ordinary system of economy, therefore it was necessary to do more than was at present being done.—Mr. Holloway, as an employer of the building trades, said he had considerable sympathy with institutions of that character. While not suggesting anything that would enlighten the committee, he fully realised there was great room for improvement in the skill of their mechanics. Employers were under a deep debt of gratitude to the chairman, who gave his time in promoting the success of the institution. He deplored the fact that the system of apprenticeship had fallen out of practice, but his firm kept it up, for the apprentices turned out the best mechanics. As an encouragement to lads in his firm, on the completion of their apprenticeship, if they had behaved themselves during that term, they received £5 to set themselves up with a set of tools. Such an encouragement was an inducement to lads to take up an apprenticeship; and institutions like that school ought never to take the place of apprenticeship, but simply to augment it. He concluded by suggesting that the foremen should be invited to visit the classes.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARNARD CASTLE.—For the erection of a farmhouse at Arlaw Banks, near Barnard Castle, for the Rev. Henry Lonsdale. Mr. F. H. Livesey, architect, Market-place, Bishop Auckland:—

R. Wilson	£670 15 0	J. Hepworth	£513 3 6
G. Scott	645 15 0	R. and S. Adamson, Gainford	450 0 0
Robinson & Addison	604 9 9	J. Tyreman	171 2 11
J. Kyle and Sons	600 0 0	J. Wainwright	31 7 6
J. Hetherington	576 2 6	J. Harrison	30 3 0

* Accepted. † Separate builders tendering together.
‡ Carpenter, joiner, plumber, painter, and glaziers' work.
§ Tiler.

BIRKENHEAD.—Accepted for flagging, paving, channelling, and sewerage of various passages, for the Corporation. Mr. C. Brownridge, Borough Engineer and Surveyor, Town Hall, Birkenhead:—

P. Gaven, Fym-street, Birkenhead	£39 5 0	£24 5 7
W. F. Chadwick, Great Howard-street, Liverpool	97 13 6	101 14 0
Thos. Horrocks, Greenwhich-road, Walton, Liverpool	58 9 10	64 7 9

BRENTFORD.—For works at the pumping station, Town Meadow, for the Urban District Council. Mr. Nowell Parr, Engineer and Surveyor to the Council, Cliftens House, Boston-road, Brentford:—

J. Brooking	£296 0	Forde and Hudson	£850 0
F. and H. F. Higgs	850 0	Godson and Son, Kilburn-lane, W.	750 0
Forde and Sons	810 0		
J. Barnes	880 9		

[Surveyor's estimate, £875.]
FORRES.—Accepted for additions to the Cluny Hill Hydropathic Establishment, Forres, and for supply of grates. Mr. J. Forrest, architect, 129, High-street, Forres:—
Masonry.—David Ross, Tolbooth-street, Forres
Carpeting.—James Smith, South-street, Forres
Slatting.—Jas. Gray and Son, Inverness
Plastering.—Angus & Ross, Orchard-road, Forres
Plumbing.—Boyne and Martin, Caroline-street, Forres
Painting.—Archibald Macdonald, High-street, Forres
Glazing.—Archibald Macdonald, do.
Blacksmithing.—W. Smith and Son, High-street, Forres
Grates.—W. Smith and Son, do.

BRISTOL.—For the construction of two new streets, with sewers and boundary wall, at Pile Marsh, St. George.—
Lloyd and Son £565 0
W. Mereweather 390 0
Thatcher 294 13 0
George* 257 13 4
*Accepted.

FOREST GATE.—For the erection of Masonic Hall, buffet, &c., at the "Princess Alice" hotel, for Mr. James Copper. Mr. Henry Poston, architect, 39, Lombard-street, E.C.—
J. Mowlem and Co. £8,224
W. J. Maddison 8,020
G. Todd and Co. 7,989
*Accepted.

HAWARDEN.—For the erection of county school. Messrs. Grayson and Ould, architects, 31, James-street, Liverpool. Quantities by Mr. E. W. Nobbs.—
H. Willcock and Co. £3,466
Thos. Brown 3,306 0
Jones and Sons 2,970 0
G. Woods and Sons 2,891 0
T. J. Reney £2,847 0
W. and T. Bailey 2,687 14
W. and T. Bailey 2,548 5
*Accepted.

HUDDESFIELD.—For erecting a dwelling-house, William-street, Crosland Moor. Mr. J. Berry, architect, 9, Queen-street, Huddersfield.—

Masonry.—J. H. Brook, Haddock.
Joinery.—Geo. Ainley, Crosland Moor.
Plumbing.—Sanderson Bros., Lockwood.
Plastering.—G. H. Day, Milnbridge.
Painting.—T. Cartwright, Crosland Moor.
Slatting.—Pickles Bros., Huddersfield.
Concreting.—John Cooke, Little Royd.

HUDDESFIELD.—For the erection of new offices and extensions to mill, for Messrs. B. Hulme and Sons, Ltd. Mr. J. Berry, architect, 9, Queen-street, Huddersfield.—

Masonry and Joinery.—B. Graham and Sons, Folly Hall.
Plumbing.—D. Taylor and Sons, Lockwood.
Plastering.—N. Jessop and Son, Berry Brow.
Painting.—J. H. Stiffard, Huddersfield.
Slatting.—E. and B. Arnold, Berry Brow.
Ironwork.—J. & J. W. Longbottom, Holmfirth.
Wood Block and Concrete. J. Cooke, Little Royd.

HUMBERSTONE (Leicester).—For excavating and foundation works for additions to Borough Asylum, for Committee of Visitors, Leicester Borough Asylum. Mr. G. T. Hine, architect, 35, Parliament-street, Westminster.—
H. Lovatt £10,443 0
Bentley & Lock 10,090 18 5
Mason and Son 10,062 13 2
E. Fox 9,169 0 0
Haycock and Son 9,104 0 0
H. Hubert £8,397 0 0
Johnson & Son 8,044 19 2
Moss and Son 6,335 17 8
Loughborough* 6,335 17 8
*Accepted.

LLANDUDNO.—For the erection of electric lighting and refuse destructor buildings, for the Urban District Council. Mr. E. P. Stephenson, engineer to the Council, Llandudno: Gledhill and Samuel Warburton.
Thomas £7,850 10 8
Evan Roberts & Son 6,891 0 0
R. Luther Roberts, Llandudno* 5,004 13 6
*Accepted.

LONDON.—For erecting residence chambers, &c., Ormond-yard, St. James', W., for Mr. Georges Lawes. Mr. W. M. Bruton, architect, Trafalgar House, Green-street, Trafalgar-square, W.C.—
Wall and Co. £5,076

*Accepted.

WEYBRIDGE.—For the erection of stables at depot in Elm Grove-road, for the Urban District Council. Mr. J. S. Crawshaw, surveyor, Weybridge.—
Stephen Brown £455
Charles Horsell 417
William Greenfield* £390
*Accepted.

WHITCHURCH, Shropshire.—For the erection of two ministers' houses, for the Primitive Methodist Trustees. Mr. J. Harry Pickard, architect.—
John Corfield £865
Geo. Edge (accepted) £835

WHITCHURCH, Shropshire.—For the erection of new workshops, &c., for Messrs. W. H. Smith and Co. Mr. J. Harry Pickard, architect.—
John Corfield £302
E. S. Pickard 255
R. Powell 217
Geo. Dodd £212
George Edge (accepted) 200

WHITCHURCH, Shropshire.—For alterations to residence, new bath-room, &c., for Mr. C. Crosse. Mr. J. Harry Pickard, architect.—
R. Powell (accepted) £92

Plumber's Work.
W. H. Smith and Co. (accepted) £26 5 6

COMPETITIONS.

CITY OF WELLS.

TO ARCHITECTS.
The Council of Wells invite COMPETITIVE PLANS for a large PUBLIC HALL, with Cloak Rooms and Retiring Rooms over the present Post Office, Market House and Fire Engine House communicating with the Town Hall, and for the CONVERSION of the Market House, &c., on the ground floor.

Premiums of £25, £15, and £10 will be awarded for the designs adjudged of sufficient merit and placed first, second, and third in order respectively. The premiated plans to become the property of the Council.

Particulars and plan of the site may be obtained on application to me upon receipt of Three Guineas, which will be returned to Architects submitting plans in accordance with such particulars.

The plans and drawings are to be deposited at my Offices, No. 1, Cathedral-green, Wells, on or before TUESDAY, NOVEMBER 30th next.

Dated, Town Clerk's Office, Wells, October 5th, 1897.
REGD. L. FOSTER,
Town Clerk.

THE DUKINFIELD URBAN DISTRICT COUNCIL are prepared to receive DESIGNS, &c., from Architects of experience for a Town Hall. Cost not to exceed £7000. Premiums of £10 and £20 will be awarded. Conditions may be had on application to Mr. S. HAGUE, Surveyor to the Council.

ESTIMATING AND QUANTITIES.

CORRESPONDENCE CLASSES now commencing in above by an experienced London Surveyor. New system specially adapted to suit the requirements of Builders' Clerks, Foremen, Leading Hands, &c.—For Terms and Full Particulars, write "Classes," care of Willings, 162, Piccadilly, W. 3

QUANTITIES.—The Central London Surveying Office, assisted by a Competent Staff, is prepared to promptly PREPARE QUANTITIES, MEASURE-UP WORK, &c., guaranteeing strict accuracy. References given.—Address, SECRETARY, Walbrook-chambers, Walbrook, E.C.

TO LOCAL SURVEYORS.—ASSISTANCE in the preparation of Sanitary, Engineering, and Architectural Drawings, Quantities, Estimates, Surveys, Reports, &c., by a Firm holding public appointment, and certificated by the Association of Municipal and County Engineers and Sanitary Institute.—Address, Box 508, Office of BUILDERS' JOURNAL. 7

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by Correspondence. No books are required.—For particulars and testimonials apply CERTIFIED COACH, 31, Herbert-road, Plumstead, S.E. 11

R.I.B.A. EXAMS. PREPARATION personally or by correspondence. Any subject taken separately if desired. Exceptional arrangements for Resident Students. Architectural Lending Library, Catalogues 6d. each.—Apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

A WEEKLY ARCHITECTURAL CAUSERIE.

R.I.B.A. Examination in Architecture. The approaching half-yearly examination of the Royal Institute of British Architects brings to mind the oft mooted question as to whether it is possible to provide any satisfactory test of ability in design. There is no doubt that a competent judge of fairly wide sympathies can arrive at an approximate estimate as to relative capacity in this direction, and he may even, if gifted with exceptional insight, be able to take into consideration the promise of future excellence not as yet completely achieved. Assuming, however, that it is practicable to decide the relative ability displayed in a number of designs, there yet remains the difficulty that, among those submitted in an examination such as that of the Institute, only a very small proportion are of a character really justifying anything of the nature of a certificate of merit. On the other hand, there is plenty of room in the architectural profession for men who are not specially gifted in the qualities productive of beautiful buildings, and the Institute feels the unwisdom of excluding such, many of whom may be of considerable capacity in other directions. It is possible to feel some degree of sympathy with this attitude, but with the course adopted to achieve this end it is impossible to agree; to attempt to examine in architectural design and then to lower the standard till it admits utterly valueless work, seems a blundering method of procedure unworthy of any body having pretensions to the position of an artistic society. "What would you have us do?" may be said. "Would you have us decline to receive all those who fail to display exceptional artistic powers? In that case we should be nearly extinguished." Certainly not, we may reply; it is, of course, necessary that an Institute of Architects should represent all branches of a Profession that, we are well aware, demands many qualifications other than the imaginative faculty and aesthetic training essential to an artist; but to do this it is not necessary that it should say that every member can design when, as a matter of fact, a large proportion can not. Admission to membership could easily be arranged so that it would not appear to the general public, any more than it now does to the Profession, as a testimony of capacity in design, but only as one of practical and scientific knowledge. The former, when deserved, might very appropriately take the form of a higher status in the ranks of the Institute. Prize winners in the annual competition, other competitors who have produced designs of notable merit, and members whose executed works show real power, should be admitted into such a class, and could, after the lapse of a specified time, be entitled to the position now held by the "respectable fathers of families;" in which contingency we might not unreasonably expect the moving spirits of the Institute to display more activity in matters architectural, and not so much in unimportant questions as to the details of professional practice. Only

by some such reform as this will the Institute obtain a hold on the best representatives of the Profession, and regain the ground it has lost during recent years, owing to its having alienated so many architects of good repute, particularly among those who look on their work more from the artistic than the commercial side.

H. V. L.

The Science of Sanitary Inspection.

It is much the present custom among architects and builders to be impatient of the sanitary inspector. We think this is a pity; and for two reasons. First, because Patience is a virtue, and the sanitary inspector at his very best, is not deserving that the architect or builder should throw their virtues to the winds on his account. Second, because the sanitary inspector, when taken in the right way, has good points of his own at bottom. The misfortune is—so few having ever succeeded in discovering the right way to take him—that his good points have rarely been hauled up to light. Though there is no doubt that

spur his enthusiasm to further efforts to condemn a drain. He knows he is paid to condemn drains, and his high moral aspiration braces the full flood of his energy and vitality to insure that any drain he has the inspection of is condemned, if mortal man can do it. A healthy sanitary inspector, in the pride and prime of life, newly recuperated by a fortnight at the seaside, and duly armed with his bye-laws, can condemn pretty well anything you can mention; and is, moreover, all tingling to be at it. He keeps the builder's foreman and clerk of works awaiting his advent for a day and a half for principle's sake; springs himself upon the site in the dinner-hour; finds no one, and goes off without a word. After a day or two he acknowledges the protests of the builder by setting his organisms in motion on his behalf. He drives up like a small fire-engine; fastens instantly on to the outfall of the house drains like some ill-omened sort of vampire; lights up his "puffing Billy," as he familiarly terms his smoke machine; dumps a heavy foot upon the escape valve to bring up the pressure; sets a strapping assistant to pump; blows out the seals of the traps in a volcano

LAUNDRY WINDOW, FAWSLEY. SKETCHED BY HERBERT NORMAN.

these points are his own, being, as they are, in point of fact, unique, nevertheless the unfaltering tenacity and invariability of them is apt to pall after a bit. What we ourselves always most relish and admire in the sanitary inspector is his magnificent imperviousness—his vast and stupendous impenetrability to all influences, outside his bye-laws, that may be moved against him. It is very rarely, indeed, that one of them is betrayed from the strict letter of his bye-law, or enticed to deviate even for a moment into the environments of reason; and "reason" is the tasteful way we prefer to spell "sense." Like Achilles, he is all nobly equipped with a hide of stolid unimpressibility, with just one vulnerable spot in the last revised issue of his bye-laws. Nor can we overlook the strong infection of plausibility and enthusiasm in his principles, and whatever else he may be, it is not to be denied that he is thorough. He leaves no stone unturned that may enable him to show the work he supervises to be wrongly done. In a spirit of most meritorious self-abnegation, he binds himself in a high sentiment of duty, and lets nothing pass that may

of smoke and water; gets a general impression of a leak somewhere, and clatters off to report "drains unsound." Or if it be the main drain that is in question he will stand and wait like an ordinary human creature, and watch the drain loaded with water to his direction, till under the abnormal strain, and in absence of the sustaining pressure of the earth, the drain gives it up, heaves aside, bursts at the joints, and fills the trenches with water. In all Science we find the enthusiasm of the master throbbing in the veins of his disciples and protégés, and thus in the clerks and assistants of sanitary inspectors is manifested a huge pulsing emulation of the ponderous dignity of their chiefs, coupled with their same qualities of stolid imperturbation and unflinching adherence to principle in matters apparently superficial and of no consideration. To these must also be added an attitude of praiseworthy activity for "original research" and innovations. Sometimes, indeed, the evidences of "research" seem almost completely lacking beside the overwhelming burst of "originality," as was presented to us lately in the

case of a sanitary inspector who dealt with an outbreak of typhoid and a bad cesspool formed under a London house from leakage of the drain, by setting a manhole and disconnector in the area and ventilating it against the sill of the larder window. But this was not, perhaps, in reality so original as at first appeared, for on investigation it was established (although the turgid state of affairs left some doubt upon the subject) that the sewage ran from the public sewer through the manhole into the cesspool, so that the arrangement had best to be described as a disconnection of the public sewer from the cesspool—obviously a very desirable thing in the circumstances. The work also had been well and carefully done, a half-twist or turn being built in the manhole so that the cover might range parallel with the wall of the house, while the bottom was perforce diagonal to it. We have not heard of any public distinction yet accorded to this enthusiast. However, we await the event expectant. It may be that we shall hear of him in connection with the Maidstone epidemic.

B. C.

An Architect's Staff.

THE building was four floors in height, and stood in the main thoroughfare of the town. A brass plate on a door that opened off the first floor level informed the would-be client that James Meredith was an A.R.I.B.A. and a F.S.I., which interpreted means an Associate of the Royal Institute of British Architects and a Fellow of the Surveyors' Institute, qualifications evidently intended to beguile the unsuspecting into the belief that the man on the first floor landing would erect them a house with drains that never got out of order, or a hall planned to carry on the town affairs, and, if put to it, to make designs for the new church, fitted with the latest improvements. Besides the private office where James Meredith saw his clients and wrestled with the difficulties pertaining to awkward sites, there was the large drawing office across the landing. The windows, which were three in number, faced the north, and looked out upon Salisbury Circus. The prospect was pleasant. The circular plot of grass, bounded by iron railings and edged with a belt of plane trees, became in summertime alive with the song of birds and the music of the wind playing through the leaves; even in winter, when the trees were bare and the frost glistened on the branches, the office staff might have discovered—if they had not been so busy on dispute—the beauty of their outlook. It is true that the artistic one of the staff did occasionally call attention to the aspect, but as he unfortunately cultivated fits of depression and a limpness of attitude irritating to the others, his remarks were not always received with that respectful attention which he considered his due. His arrival in the morning was uncertain, but when the office door did swing back and his form appeared in the doorway, he was greeted with uproarious song, the words of it being more expressive perhaps than when the door yielded to the pressure of James Meredith's hand. Now, although the artistic one walked about between the two offices with an abstracted air, that not infrequently landed him in a friendly conversation with the safe in mistake for the Irish draughtsman, he was not disliked, his indulgence at times in fierce invective, and a rooted objection to work when a gloomy mood overtook him, were weaknesses regarded with some pity, and not a little amusement. The Irishman, who worked at one end of the room, opposite the door, was the nearest approach to a good-looking assistant that the office staff could boast, for while the business manager had a

good enough heart, his nose was ill-adapted for the face which it adorned; a mistaken nose thrown on as it were incidentally, a spiteful afterthought of Nature. Still, as the manager had a very serious dislike to being classed with architects, his nose assisted in this deception, which he practised upon his innocent friends and relations. A large check suit, patent boots, an indifferent air, and intermittent outbursts of wrath if anyone was unwise enough to connect him with the practice of Architecture—suggests the manager, or at least a part of him. He generally worked at the extreme end of the big board, which ran the whole length of the room. About the middle of the long board sat the Scotchman, who walked into the office in the early morning with a great-things-in-his-head expression on his face. Removing his coat and hat carefully, he would hover round and about in readiness, to seize the first opportunity of relieving his mind of several uninteresting matters; if anyone appeared responsive to his hungry look, his fate was sealed, the victim was approached and held captive with large black eyes, while a torrent of words poured out in a regular flow, that ceased only when attention was withdrawn. If the Irishman was working, the manager indifferent, and the artistic one wrapt in contemplation of the unseen, the Scotchman, who was nothing if not argumentative, made serious efforts to work the simple and large framed pupil into an attentive mood; a task by no means easy for the pupil, who without being altogether a cypher—at least in size—was disinclined for exercise of a mental nature, in fact, he was ornamental rather than useful, stood 6ft. 2in. in his socks, and dressed like a Mexican cow-boy. The office up to the time of his coming was fairly roomy, but at his entrance dwindled in size and became full. On those days when the master builder fled into the country in search of a job, the office staff would hold informal debate. The Irishman, with more energy than the subject seemed to call for, would declare that a door with stop-chamfered rails, and an architrave formed like an Oxford frame, was a good enough thing in its way, a statement the Scotchman would challenge calmly and philosophically. A door, he would say, so decorated is a soulless and feeble imitation of past workmen. This would be fiercely denied. To be strictly accurate, two minutes might possibly be allowed before the debate reached the abusive stage, after which the eyes of the Irishman flashed, and those of the Scotchman burned with a sombre glow, the atmosphere of the room vibrating with the sound of wordy combat, suddenly to cease on the entrance of a bland traveller, or the frequent visit of the wonderfully clever artist, with a discontented face expressive of a habitual desire to slay someone. Towards the close of the day, when argument languished, and the office took on a pensive air, you could catch the chortling notes of the pigeons without, and then the rattle of squares, the covering up of boards, and the general movements suggestive of departure. By quarter to six all had gone save the Irishman, who cleared out about half-an-hour later. The office, now wrapped in silence, would have been uninteresting to the casual observer. Next the door a safe, and in the further corners of the room shelves with directories and innumerable letter books thereon. But this was not all. Its previous occupants had unwittingly left behind some signs of their idiosyncracies. The board of the Irishman was littered with many drawings, three specifications, and to the left of where he had sat, pinned against the wall, were a number of little tracings to which in work hours he constantly referred without finding what he sought. The Scotchman's desk was cleared up neatly, and a T-square laid across the drawings in such a way as to suggest his never returning to work again,

an action on his part which was, perhaps, father to the thought. The business manager had been rather careless. On his board were the remains of a cigarette, the duster with which he had brightened his patent shoes, a broken looking-glass, with a forlorn pair of scissors lying near that had done duty as a razor previous to his exit.

G. L. L. M.

NEWCASTLE CATHEDRAL.

IT is Rufus who must be regarded as the founder of the present city of Newcastle. The burgesses of the infant town soon built a church, which they dedicated to St. Nicholas, the Bishop of Myra, and who "is so famous for his miracles and apparitions," so writes Bourne, "that he has merited the title of the patron saint of sailors." The church was destroyed by fire in 1216. The rebuilding took a long time, and the church, which is now the glory and pride of Newcastle, was not finished until 1350. The interior of St. Nicholas is imposing, the total length of nave and choir being about 245ft. The space between the tower and the transept is divided into three aisles, by firm, elegant, octagon pillars. Curiously, the centre division of the nave is narrower than either of the side aisles. The church may be briefly described as of the Decorated period, and is cruciform, there being no tower at the intersection. The steeple, of which more anon, is 100 years later, the original tower being square, with an embattled top. In the pages of local history one may trace St. Nicholas through the vicissitudes of time, law, and custom. In its early days it was, says the Daily Mail, filled with glittering shrines and richly decked altars, for the guilds of the merchant adventurers of Newcastle loved their church, and delighted to adorn it. In those days it saw many kings and queens, prelates and nobles, knights and dames, wealthy burghers and common people, alike kneeling before its altars. Then the scene changed,

"THE CARVED WORK WAS BROKEN DOWN,"

and the bare walls and benches re-echoed the thunder of Covenant and Puritan. Still one further change took place, for St. Nicholas' was "restored" according to the taste of the eighteenth century. When the "restorer" came the pulpit was torn down, the pews and the tombstones that were not claimed were sold by auction—no record of the moneys received are to be found, so that a noble opportunity occurred for anyone who wanted a few "ancestors by purchase"—and the nave was left desolate. This was in 1783. The authorities decided that it should be used for burial purposes only. The services were removed to the choir, the organ was turned round to face the east, the communion table was placed against the east wall, and a wooden screen, that will not bear describing, was erected between the dismal nave and the transmogrified choir. Between the years 1873 and 1877 extensive reconstruction was effected in the church, under the guidance of Sir William Scott, at a cost of £21,000. The church was restored to its original appearance, the congregation was again seated in the nave, and the choir re-stalled. The altar was brought forward from the east wall, and a beautiful reredos of Uttoxeter alabaster was erected across the chancel, the design being based on the

GREAT MEDIEVAL ALTAR PIECES

of Christchurch, Winchester, and St. Albans. The bishop's throne—St. Nicholas was made the seat of a bishop in 1882—is exceedingly handsome, and is crowned with lofty tabernacle-work of oak, ending in a crocketed spire 36ft. from the pavement. Eastward of the reredos the church has been excavated so as to disclose the original bases of the pillars, and this area has been fitted up with an altar with an effective triptych reredos. Upon the retables of both this and the high altar are crosses and candlesticks. In this chapel there is bracketed from the wall a small organ, the larger instrument being placed in the north transept.

NORTHAMPTONSHIRE.

By HERBERT NORMAN.

(Continued from page 228.)

HAVING thus taken the principal interesting buildings in the town, and continuing in the same direction, we pass over the South Bridge and out into the country, where we are soon again in interesting company, that of Delapré Abbey. It was here that the body of Queen Eleanor rested during the funereal march from Hardeby in Nottinghamshire to Westminster, and about a mile further on, standing at the side of the highway, we see one of the fine crosses erected by Edward I. to commemorate the places where the cortège stopped. Northamptonshire is lucky in having two out of the three remaining, the other at Gedding-ton does not compare with the one we are now looking at, which is octagonal in form and raised upon steps; with its surrounding background of beech trees it forms one of the most graceful and chaste pieces of Architecture in the county. The top of both crosses have paid the penalty supposed to be due to their form by the narrow-minded and truly destructive nature of Puritanism. Earls Barton forms the menu for our next day's jaunt, where the Anglo-Saxon sturdy old tower of the church stands looking down upon the incongruous surroundings of factories and slated cottages, for this village is fast developing into a town; but just across on the other side of Nene we find the typical English village of Castle Ashby, with the seat of the Marquis of Northampton; strange that two villages of such diversity of character should be such near neighbours. At the latter we gather at once the impression of wealth and consideration shown to the villagers by the wealthy. Take for instance the charmingly situated and well kept church, nestling among the trees of the castle grounds; no wonder it forms a favourite resort to Northamptonians. Where can we find, when £4709 11s. 4d. is required to restore the village church, a patron who will give, as a Marquis in this case has done, £3809 11s. 4d.? and where again do we find a rector that can design the chancel tiles for his church as we do here? Happy is the lot of the architect whose work is cast among such favourable surroundings; less should we hear of desecration, and not restoration, and churches in such condition might be more numerous.

A little to the right we find another of these old world villages, Whiston, where there is a fine example of Perpendicular work in the church; this, to the student of late Gothic, is well worthy of a visit.

I have just taken these three villages with their characteristic churches to give an idea of what may be found in almost every village of the county. Nothing can now be said of numerous others. The Roman work at Brixworth, the quaint old saddle-backed tower at Rothersthorpe; Fawsley, and Catesby, and their connections with the Gunpowder Plot; the picturesque seat of that grand old and hospitable antiquarian, Sir Henry Dryden, Canons Ashby; Peterborough Cathedral, of which much has been and still could be written; the Renaissance work at Kirby; Inigo Jones' work at Castle Ashby; the homes of the wealthy, Althorpe, Holdenby, and Rushton, with its curious triangular lodge; the smaller houses, as Sywell, and numerous stone farmhouses, down to the cottages with their mullioned windows and characteristic Northamptonshire chimneys—these, and others besides those mentioned at the commencement, must be left to be dealt with at some future time. Sufficient, however, has been said to convince all interested that Northamptonshire does possess Architectural beauties well worthy of a careful study, and to prove that, no matter to what style of architecture the student may be inclined, here he will find something worthy of his attention and consideration.

WIDENING OF LUDGATE HILL.

THE Improvements Committee of the London County Council has recently had before it an application from the Commission of Sewers renewing the application for a contribution towards the cost of the widening of Ludgate Hill between St. Martin's Court and Pilgrim Street. The widening of this portion of Ludgate Hill was being carried out by the Commissioners when the Council superseded the Metropolitan Board, and was at that time the only portion of the widened thoroughfare towards the cost of which the Board had not

ing to a little over £30,000. For each of the years 1880 to 1888 the amount was £30,000. The annual contribution of £30,000 was not given in a lump sum, but was appropriated thus: Every year the Commissioners submitted

A BATCH OF PROJECTED IMPROVEMENTS,

and such of them as were approved of by the Metropolitan Board subsequently ranked for contribution when they were completed. If in any year the moiety of the cost of the completed improvements exceeded £30,000, the sum paid was limited to £30,000, and if it fell short of £30,000, the actual moiety only

SKETCHED BY HERBERT NORMAN.

contributed. It appeared that, between the years 1876 and 1888 inclusive, it was the practice of the late Metropolitan Board to fix a limit to the amount of contributions to be made to the Commissioners of Sewers in respect of City improvements. In the year 1876 the amount which the Board was authorised to devote to local improvements was £120,000, and out of this the sum of £60,000 was appropriated to improvements in the City. In the year 1877, and all subsequent years up to and including 1888, the amount which the Board was authorised to apply to local improvements was £100,000 in each year, and the amounts which were fixed as a limit in respect of City improvements were, for each of the years 1877 and 1879, £50,000. In 1878 no limit was named, but contributions were voted amount-

was paid; but, as the City improvements cost greatly in excess of £60,000 per annum, the Commissioners had little difficulty in establishing a claim for the full amount of £30,000. After a consideration of these facts the Council, upon the recommendation of the Committee, decided: (a) "That all outstanding applications of the City Commissioners of Sewers for contributions be disposed of by the Council declining to contribute unless exceptional circumstances can be shown for any particular improvement having been carried out without the specific consent of the late Board, in which circumstance the improvement shall be considered on its merits. (b) "That all future contributions towards the cost of improvements in the City of London be upon the same footing, and be made in the

SYWELL HALL. SKETCHED BY HERBERT NORMAN.

same manner as contributions to improvements in other parts of the county." These decisions were communicated to the Commissioners, with the result that they asked for a reconsideration of the whole subject, mentioning particularly the widening of Ludgate Hill between St. Martin's Court and Pilgrim Street, and special reasons were adduced for that improvement having been undertaken without the specific consent of the Metropolitan Board. The Commissioners referred to the fact that the Board had contributed half the cost of each completed portion of the Ludgate Hill improvement, and that by so doing they had expressed their general approval of the widening of the thoroughfare. Moreover, it had been contended that it was most necessary to carry out the improvement the moment it had been decided upon, in order to avoid the granting of new leases, or the creation of new interests. The Commissioners also pointed out that the widening of Ludgate Hill was a county improvement, and they stated that they felt sure the Council would not deprive them of a contribution on account of the mere accident that at the time of carrying out the work the authority was transferred from the late Board to the Council. The width of the portion of the thoroughfare in question had been increased from 42ft. 6in. to 60ft., at a cost stated by the Commissioners to be £38,720. Having considered that application, the Committee brought up a report to the Council on May 16th, 1893, in which it stated that, whilst it admitted the importance of the work, it felt precluded from advising the Council to contribute towards the cost, having regard to the Council's resolution of November 26th, 1889. Its report was adopted by the Council, and the Council's decision not to contribute was accordingly communicated to the Commissioners. The Council, on October 15th, 1895, however, agreed to contribute half the net cost of widening Ludgate Hill at Nos. 1, 3, 5, 7 and 9, and at No. 1,

St. Paul's Churchyard, the estimated net cost of that work having been £89,920. The Commissioners, before commencing that improvement, complied with the rules of the Council governing applications for contributions towards the cost of improvements; that was to say, before undertaking the work they submitted the proposal to the Council for approval, and forwarded proper plans and estimates of the cost. Having reviewed all the facts, it now appeared to the Committee that there was some force in the arguments adduced by the Commissioners, and they thought that in this particular improvement (St. Martin's Court to Pilgrim Street) there were special circumstances which might justify the Council in acceding to the request for a contribution. There was little doubt that if the Commissioners had delayed taking action the improvement would have cost far more than it had done; in fact, it was possible that, had it not been undertaken when it was, that portion of Ludgate Hill might have remained narrow and unsightly to the present day. Moreover, the Metropolitan Board, having contributed towards the cost of the widening of the other portions of the thoroughfare, thereby clearly expressed its general approval of the improvement. The widening of Ludgate Hill had been necessitated not by local but by general through traffic going to and from all parts of the county. It was of opinion that the necessity and importance of the improvement, and the fact that it was one in which the inhabitants of London were interested, justified the Council, should it feel so disposed, to accede to the application for a contribution. There was one remaining point to which the Committee must call attention. It had already stated that, upon a former occasion when it reported upon the subject, the cost of the improvement was given by the Commissioners as £38,720. In the Commissioners last letter, however, asking for a reconsideration of the

subject, the cost was put at £67,230 13s. In recommending a contribution of half the net cost, therefore, the Committee had decided to advise that the contribution should be based upon the smaller amount, and "that the estimate of £19,360 to be submitted by the Finance Committee be approved, and that the Council do contribute on the usual conditions one-half of the net cost of the widening of Ludgate Hill, between St. Martin's Court and Pilgrim Street, as shown upon the plan submitted by the City Commissioners of Sewers, such contribution not to exceed the sum of £19,360."

Dr. Collins presided over the last weekly meeting of the London County Council.—Lord Welby (Chairman of the Finance Committee) asked the permission of the Council to withdraw the report dealing with the Works Department. His reason was that reports from the officers had raised the question that the schedule prices might be too high, and the sub-committee was consulting the General Purposes Committee on the matter.—The Earl of Hardwicke asked if it was not a fact that the reason of the withdrawal of the report was that the schedule value was $4\frac{1}{2}$ per cent. higher in the Works Department than it was for contractors.—Lord Welby asked if that was not raising a discussion on the report, which he had not moved.—The chairman said it was usual, when a committee wished to withdraw a report, for the Council to accede to the request, and under those circumstances discussion would not be in order.

THE Romans generally got the credit of having the most perfect water supplies of the Ancients, but recent excavations in Greece show that the Greeks, by employing underground conduits, were in advance of the Roman aqueducts, which, however, being more "in evidence," probably acquired more notoriety.

THEATRE ALTERATIONS AT SHEFFIELD.

THE City Theatre at Sheffield, recently transformed into the handsomely appointed Lyceum, ranks with any similar building in the county. It is not many years since the old wooden building, known as Stacey's Circus, was destroyed by fire, yet it is singular to note how rapid has been the progress of theatrical enterprise since that time. The city deserves this attention. No public has been more generous than the people of Sheffield in supporting theatrical entertainments, and those who are responsible for this class of diversion have seen clearly that it is necessary to keep pace with the movement of the great cities among which Sheffield is taking her place. The building of the Empire Palace has had its effect in exhibiting the class of surroundings it is possible to obtain at the ordinary prices. There were great hopes of the old City Theatre in its earliest days, but it stopped short of the realisation, and it was left for the syndicate who took over the concern to justify their reputation by a thorough and unsparing expenditure. Regarded both from an exterior and an interior point of view, the change has been entire, so much so that very little of the familiar phases of the old building remain. The elevation is now bold and striking, and of classic design. To carry out the plans of the architect, Mr. W. G. R. Sprague, it was necessary to abolish the shops, which lent

NO SENSE OF IMPORTANCE.

to the structure. Everything has been utilised to secure the public convenience, and that on the best scale possible. The circular tower, some 70ft. high, surmounted as it is by a copper dome and a flying figure some 12ft. high—which is to carry an arc lamp of 500 candle power—is really the central idea of the change, affording a commodious and luxurious entrance in place of one which used to be somewhat meagre and bare. Surrounding this point is a handsome iron and glass shelter, which heightens the decorative effect, studied also in the lighting of the several doors which open to the vestibule. The stained glass in the doors, and the brass electrolier overhead, are in keeping with the artistic detail in the charmingly painted ceiling of the foyer, and the fibrous plaster work which supports it. The tower is at the corner, and the frontages in Arundel Street and Tudor Street are relieved with groups of flowers and foliage; the whole, in its stucco covering, relieved with terracotta, presenting a very handsome appearance. Entering, the visitor will proceed by the grand staircase, the front of which is of marble, to the dress circle, the upper circle being reached

by a companion staircase on the right, and the stalls by a passage on the left, past the booking offices. The interior presents an ornate appearance, heavy gildings, bold carvings, and delicately-coloured emblematic figures embellishing the points which meet the eye in a sweeping glance which takes in the entire picture. The roof is loftier, the proscenium front higher, and the impression, while conveying the idea of space, is not that of magnificence only, but of solid comfort and luxuriance. The work on the dome was entrusted to Messrs. De Jong and Company,

of London. The figures done in delicate tints are dreamy and harmonious representations of the fine Arts on a pale sky-blue ground, the surrounding gildings heightened the effect in a highly artistic style. Four cameo paintings fill the corner panels, and into the panel over the proscenium Cupids are gracefully introduced. The scheme of decoration is throughout of the beautiful style of Louis Quatorze. Gilt and cream mark its essential features inside; from roof to ceiling these prevail. Over the boxes on the circle tier the panels are appropriately and tastefully filled in, and the niches on either side of the stage are occupied by statues of music and the drama. The private boxes rise tier by tier to the top of the house, so that there is no break in the architectural plan. They lend an air of solidarity to the decoration, and their drapings and hanging portieres make them

inviting and luxuriant. The balcony front of fibrous plaster-work is beautifully moulded, the designs harmonising throughout with the dress circle front, and the electric lamps in ornamental brass are additionally attractive. Light is shed on all this magnificence from eighty pretty electroliers about the dome, in the centre of which is a sunlight, where gas is fixed for emergency. From every point of the house there is an uninterrupted view of every part of the stage. The line of sight is throughout—even at the back of the gallery—perfect. A special feature has been made of the orchestra stalls. They occupy nearly all the space between the circle balcony and the orchestra. Access is obtained to either side of the grand circle by a lobby, which passes underneath the upper circle, the walls of which, as in all the staircases, are covered with Japanese paper.

THE VENTILATION OF THE BUILDING

and its sanitation are from the newest and most approved designs. Hydrants are liberally placed, and there are numerous safety-doors, with extra exits, from almost every quarter. As an additional safeguard, in the building iron and steel girders, concrete and brick, have been entirely used, so that the auditorium is practically fireproof. A fireproof curtain of steel cuts the stage off from the front of the house, and the electric light has been installed behind the stage, as before it. The contractors engaged in the work are: Messrs. Longden and Sons, contractors, Sheffield; Messrs. De Jong and Co., decorators, London; Messrs. Merryweather, hydrants and fire appliances, London; Messrs. Strode and Co., gas and hot water heating, London; Sheffield Electric Light Company, electric lighting contractors; Messrs. Owen, Luck, and Pike, consulting electricians; Messrs. Cranston and Elliott, furnishing and seating, Edinburgh; Messrs. Walker and Sons, bar fittings, London; Mr. Hy. De Grelle Hondoet, parquet and mosaic work, London; Messrs. Moreland and Sons, constructional iron work; Messrs. Corrie and Sons, sanitary and plumbing work; Mr. F. H. Marchant, of Exchange Street, Sheffield; for brass handrails.

A HANDSOME church for the use of seagoing men of the port of London is to be built, on the designs of Sir Arthur Blomfield and Sons, alongside the Missions to Seamen Institute in Poplar, with a covered way between.

The opening of the new schoolroom at Ellesmere College marks a great step towards the completion of the buildings. The school was opened in 1884, and now accommodates 200 boarders. The cost of the latest addition has been £5000.

SKETCHED BY HERBERT NORMAN.

RESTORATION OF A TYNESIDE CHURCH.

THE finishing touches are now being given to the external additions and internal improvements and decorations in connection with the ancient parish church of Newburn. The work of the restoration and renovation of the old church has been pushed forward all through the summer months, the services of the best known experts in the various branches of ecclesiastical Art having been secured. A new porch has been built to the south entrance with massive walls of undressed stone, to correspond with the walls and buttresses of the ancient building, the tower of which is pure Norman, and is known to have been scathed by fire and girt about by the serried ranks of the invader some six centuries before the guns of General Leslie belched forth destruction from its summit on the Royalist troops entrenched on the haughs between Ryton and the Tyne. Immediately over the entrance portico to the new porch is a deep recess, with pointed arch with cut stone tracery of exquisite design, and shields of polished stone on the right and left. The floor of the interior is laid with permanent herring-bone tiles, relieved by a bright border, whilst on the right and on the left seats of massive oak extend the entire length of the porch. The seats have been introduced with a view of perpetuating the old custom of country people resting in the porch after a long walk before entering the sacred edifice. A new vestry has been added, and extensive alterations made to

THE WEST WING OF THE BUILDING.

The new reredos is in the form of a triptych with folding doors, beautifully gilt, the framing of solid oak being shown in bold relief. The columns are of Caen stone, and the contrast is very fine. The pictures introduced in the panelling are numerous and select, the object of the designer being to typify and illustrate the mission of angels in heaven and on earth, and the artist has carried the idea into effect with a master hand, the church having been dedicated to St. Michael and All Angels. In addition to the pictures in the panels, there are three tiers of sculptured figures which give the finishing touches to a notable work of Art, the mission of the angels being again brought into prominence. The marble pavement at the chancel screen, which is alike worthy of the reverend associations of the building and the scholarly taste of the architect, has brought to light the singular fact that the chancel is not straight, being what is known in ecclesiastical Art as a "weeping chancel," a custom followed in connection with the majority of the cruciform Churches built in the Middle Ages. Immediately over the chancel screen is a picture, the colouring of which is strikingly brought out, Christ is represented as standing over the "wells of

salvation." On the left of the central figure a number of female saints are artistically grouped. On the right side of the picture the same local colouring is studiously kept in view by the artist, very realistic portraits of St. Aidan and St. Cuthbert, both of whom had a large share in the Christianising of ancient Northumbria, being grouped in the foreground, together with St. Oswald, who planted the cross near Hexham and fought for the faith, while St. Benedict represents the monastic orders, and St. Jerome, one of the four doctors of the West, represents Latin Christianity, St. Athanasius being the repre-

sentative of Eastern Christianity. Like the majority of churches which in early times were dedicated to St. Michael and All Angels, the church at Newburn stands on a hill, from which the view in the summer and autumn months is

SINGULARLY BEAUTIFUL AND PICTURESQUE

—so much so, indeed, that it is said that the artist who painted the "Plains of Heaven" obtained his ideal from the lovely scenery viewed from the eminence on which the church of Newburn stands, just as Lough, the celebrated sculptor of that name, conceived his ideal of Milo from the towering rocks at the Sneep, a wooded ravine at a bend of the river Derwent. The buttresses of the church

are regarded as being exceptionally rare, but still more peculiar is the curious circumstance that in the interior of the building the north arcade is a fine illustration of the Early English style of Architecture, while the south series of arches are as distinctly Norman. There is no data to show how the strange transformation came about. Another link, characteristic of early times, is the preservation of an ancient Easter sepulchre in an arched recess on the north side of the altar. The carved woodwork in the interior, which is delicate and artistic, was executed by Mr. Ralph Hedley, Newcastle; the marble by Messrs. Beall, of the same city; and the carved stone figures by Messrs. Milburn, of York; the marble floors by Messrs. Emley, Newcastle; and the paintings by Messrs. Bacon Bros., of London; while the whole of the artistic work has been supervised and directed by Messrs. Hicks and Charlewood, Newcastle.

WESTMORLAND ANTIQUARIANS.

THE Westmorland and Cumberland Antiquarian Society at its second meeting of the year, at Penrith, some days ago, visited Edenhall Church, the principal features of which were explained by the Rev. W. Lovejoy, vicar; Glassonby, where a halt was made at the residence of Mr. W. E. Rowley, to inspect some carved wood-work; to Old Parks, where the articles dug up a few years ago from the great tumulus were exhibited by Mr. W. Potter; Kirkoswald Castle; Kirkoswald Church, where Canon Thornley explained the various points of interest; and the tower on the hill. A meeting was subsequently held at Penrith, at which several papers on the work of the Society were read. Mr. F. Haverfield, F.S.A., stated that the excavations carried out under the auspices of the Society during the past two months have been chiefly connected with the neighbourhood of Birdoswald and Gilsland. At Birdoswald we trenched various spots on the east side of the fort to discover the course pursued by the Vallum, and to find out if the turf wall, traced on the west side of the fort in 1895 and 1896, existed also on the east side. The results were most satisfactory, the Vallum had been discovered in 1896 to diverge from its straight line as it approached the west side of the fort and to pass in a rather irregular course along its south face. This year we ascertained that it returned on the east side of the fort to its normal position near the wall and parallel to it. That is to say, we completed the proof that the Vallum at Birdoswald diverged from its course to avoid the area occupied by the fort. I may say in passing that some excavations carried out by myself in conjunction with Mr. C. B. Bates at Carrawburg in Northumberland also confirmed the result obtained there in 1896—that the Vallum either stops or turns aside to avoid the fort. (2) The turf wall was found in 1894-5 to run from Wallbower due east close up to the west wall of the fort, and indeed in such a course that it would have come close to the N.W. gateway, now no longer existing. In the present year we ascertained that it existed once on the eastern side of the fort, and not only that; our trenches seemed to show that it ran right across the area now occupied by the fort. In other words,

THE TURF WALL AT BIRDOSWALD

represents what we have nowhere else along the whole line of Hadrian's Wall, a line of frontier earlier than the existing stone wall and forts. At present it is a line only two miles long, and I regret to say that all endeavours to find traces elsewhere have so far failed. But it is certainly a very remarkable fact that we should find even two miles of this earlier line, and Cumberland may be congratulated on the possession of this unique relic. At Gilsland our endeavours were limited chiefly to tracing the course of the Vallum near the Poltroosburn. It appears to us, and our trenches confirmed the ideas, that the Vallum crossed the burn at the point where there is a dip in the bank on each side, and some curious retaining walls of rough but not

"THE SUN" AT WELLINGBOROUGH, NORTHANTS.

Early Saxon
Church

wholly irregular masonry, excavated by the Society in 1886 at the date of the then pilgrimage. It has been sometimes supposed that this masonry represented the retaining walls on each side of the mural road, here taken across the Poltross. Our excavations, however, showed that this was hardly the case; the retaining walls represent rather the ends of the mounds of the Vallum, banked up, thus to prevent their slipping down the steep bank into the Poltross. I may add that we could find no trace of the mural road at the Poltross. Evidences of it, close behind the wall, were found during some draining operations last spring in a field close to the vicarage, but it was not discoverable on the east of the burn, and some search made, by the permission of Mr. John Crowe, of Chapelhouse, was equally fruitless. For the next year, 1898, it is proposed to finish up certain details at Birdoswald and Gilsland. It should also be possible to ascertain the course of the Vallum near Castlesteads, the one point east of Carlisle where the line of the earthwork is seriously obscure; to test the "camp" at Hawkhurst, near Brampton, and its vicinity; and last, but certainly not least, to attack the problems connected with the wall west of Carlisle—for instance, its course near Burgh Marsh. It may be permitted to add two remarks made by competent archaeologists, who chanced to visit our trenches. One was that the discoveries made this year and last with respect to the Vallum and turf wall are the most important made along the wall for years. The other was—and it came from a Scotchman, as well as from an excavator of experience—that the cost in money of obtaining these results was extraordinarily small.

EXCAVATIONS AT FURNESS ABBEY.

In the evening, a report prepared by the President (Chancellor Ferguson) upon the work done at Furness Abbey during the month, was submitted. In this the Chancellor stated that the foundations of the buildings round the cloister garth have been uncovered and carefully planned and measured. One thing had been made apparent—that the refectory or frater had been pulled down, and two new ones erected side by side. This was done to evade the statute, which directed that Cistercians were not to eat meat in the frater. So they built two. In one, the "lean frater," they had no meat; but on three days in the week they dined in the "fat frater," and on meat. It had also been discovered that the Cistercians rebuilt the church at an early date.—The Rev. J. Whiteside, Vicar of Shap, submitted a paper on "Kirkbride Church." Mr. Whiteside said the Romans had previously a camp on the eminence where the church is built. There were traces of the moat or fosse, the Roman road went close by, and the stones

of the church, being such as would be used in their wall, may possibly have come from Bowness, if they did not form the walls of the local fort. In the chancel wall was discovered the fragment of a Roman jug. Though the fabric was not erected to serve the purpose of a fortress, it cannot be doubted that the parishioners sometimes fled to it for safety. It was a convenient point from which to watch the movements of the moss-trooper, and seek security against his rude alarms. When a partial restoration of the church took place twenty-five years ago, the floor of the nave was removed, and some seventy skeletons were found. All were males, and had been buried close to the surface without coffins, higgledy-piggledy; probably as they were brought in from battle. There were no such interments in the chancel. The fabric in 1894 wore an aspect of uncared-for slovenliness. The chancel was in a thoroughly dilapidated condition, the east wall hanging forward more than a foot beyond the perpendicular, with gaping fissures on the north and south sides, with rotten floor and damp atmosphere and fusty smells. The rectory pew was a trap through which the unwary worshipper dropped and barked his shins, and newts from the soil below made their appearance during Divine service. The work of restoration was commenced in August, 1895, and finished in December. A description of the principal works of restoration, of the monuments in the church, was included in this interesting paper;

as well as some notice of several Kirkbride men who fought at Waterloo.—"Heraldic Glass in Edenhall Church" was the subject of a paper by Dr. Haswell, Penrith. It had been stated by Machell that there was a quantity of stained glass in the windows of Edenhall, with the arms of Musgrave and their quarterings. He (Dr. Haswell) thought it probable that when the present hall was built, in 1820, this glass was removed to the church. The four pieces of glass in the side chancel windows were all of the same design, which was about 1650 to 1700. The right-hand light in the north window contained the arms of Musgrave, impaling Stapleton, with the inscription below: "Richard Musgrave, Kt., married Johan, daughter of one of the heirs of William Stapleton." Was this a mistake, or had the pedigree been wrongly recorded by Dugdale? Dr. Haswell thought the glass made it open to doubt whether it was Thomas Musgrave or his brother Richard who founded the fortunes of the Edenhall family. Other glass in the church was described in detail.

THE east end of the ancient parish church of Chislehurst has been extended several feet, with much ornamentation.

On Saturday week the Earl of Crewe opened a technical institute and also an isolation hospital at Crewe, both of which buildings have been erected under the direction of the municipality.

TOMB AT WHISTON.

SKETCHED BY HERBERT NORMAN.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
October 27th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ARCHITECTS are scoffing at the parsimony displayed by the Wells authorities in offering a paltry prize of £25 for a design for the town hall, more especially as particulars of the competition cannot be obtained unless a deposit of three guineas is made. The Wells authorities evidently do not place the work of the architect at a very high value.

LONDON is again "up"; successively in Parliament Street, in Piccadilly, and in the Strand, three of the great City's principal arteries. The "continued in our next" improvements of Piccadilly causes something like a panic amongst shopkeepers who have not forgotten the anarchy that existed here just a year ago. In various other parts of the Metropolis the pavior holds high revel. Autumn seemingly is his carnival time.

THE Poet Laureate, in his speech at the opening of the School of Science and Art at Ashford, made some practical remarks, well worthy of attention, about the manner in which students of Art should apply the knowledge which such schools exist to supply. He judiciously warned the youthful enthusiast against giving way to the too common desire to become an artist in merely the popular acceptance of the word, and against the adoption of a career in which prizes are within the reach of only a few men of exceptional talent or extraordinary business capacity. What, he argued, with undeniable logic, was that there is no loss of dignity on the part of the artist in devoting himself to craftsmanship, and that as a decorator or designer he has opportunities of being successful in many ways which are not open to the simple painter of pictures. All this is perfectly true, and claims the consideration of everyone who is ambitious to follow the artistic calling. The ranks of the painters are already overcrowded, but for the really artistic craftsman there is a demand that, so far, cannot by any means be adequately satisfied; a position of affairs which should be significant enough to every young artist and student.

THE restoration of Stratford-on-Avon church, wherein lie the remains of Shakespeare, was commenced eight years ago. The sum of £6000 was then raised by subscription, chiefly in the neighbourhood, and expended principally in the repair of the outside of the fabric and the interior of the chancel. Very little was done to the interior of the nave and transepts, and it is now desired to complete the original design by restoring them. The work is being done under the advice of Mr. G. F. Bodley, A.R.A., under whose supervision the previous part of the restoration was carried out. Three things are aimed at—(1) the rearrangement of the organ; (2) the relaying of the floor of the nave, the cleansing of its walls and pillars, and the substitution of open oak benches for the present pews; also the readjustment and enlargement of the heating apparatus, and the introduction of the electric light; (3) the rebuilding, on a

revised plan, of the old vestry, taken down about 100 years ago on account of its dilapidated condition. It is expected that the sum of £5000 will be required.

MR. F. C. PENESE had held the position of Surveyor to St. Paul's Cathedral for forty-five years previous to his recent resignation. It will not be easy to identify the post with another personality. It may be said of him that he was almost as familiar with the architectural aspect of ancient Athens as he was with the structure so long committed to his care. His work on the Parthenon is acknowledged in all countries to be the highest authority on the subject. His knowledge of the style of the Italian Renaissance peculiarly fitted him for the task of conserving Wren's masterpiece, whilst, like Wren, he possesses high mathematical attainments.

THE French Art press is filled with admiration at the freedom with which English living architects are allowed to be criticised by their own countrymen. It lauds the way in which the public is called upon to condemn any projected vandalism, such as of the syndicate which proposes to cover historic sites in Cornwall with monstrous hotels. The French law is apparently more rigorous, and would consider this to be defamation of character.

WHEN the next General Assembly is convened at Burlington House, two vacancies have to be filled up in the ranks of the Academicians. They are caused by Mr. Horsley's resignation and by Sir John Gilbert's death. Except Mr. Leader, there is no one outside the Forty whose claim looms large in the public appreciation, and Mr. Leader has so often been a proxime accessit that his inclusion this time should be safe. Another Associate much in the running is Mr. Gregory. His name is generally to be found in past catalogues amongst the members who "do not exhibit this year." But his "Boulter's Lock" in the last exhibition has brought him into notice at a critical time. The constant preponderance of the figure painter in the list of the R.A.'s is due, not to any slighting of landscape or seascape, but to the fact that the services of the figure painter are needed for the schools. For this very reason the other branches should be adequately represented amongst the Associates.

As the first of its winter exhibitions the Fine Art Society is showing, in the larger of its two galleries, a selection of original designs for "The Pilgrim's Progress," made for engraving on wood by three brothers, George Wooliscroft Rhead, R.E., Frederick A. Rhead, and Louis Rhead. The vast poetical imagery, the naiveté and sense of absolute conviction which keep Bunyan's allegory fresh in the minds of all Englishmen, have on many previous occasions tempted ambitious draughtsmen—both those of realistic as well as those of idealistic leanings. Yet neither on those occasions, nor indeed now, can full justice be said to have been done to Bunyan's poetical symbolisms. The Messrs. Rhead, and chief among them Mr. G. Wooliscroft Rhead, to whom have been allotted the most significant and the most popular subjects, must be credited with earnest endeavour, with the aspiration towards the imaginative and the ideal rather than with its attainment. For all the rugged strength affected in these big, black-and-white designs, there is apparent in them a certain emptiness, a certain superficiality, which is the cause that he who takes his Bunyan very much *au sérieux* must retire from the contemplation of them still hungry for more solid food, for matter of graver import. A powerful design of its kind is the "Moses breaking the Tables over the head of Faithful," in which the pitfall provided by the mixture of the sublime and the grotesque in the motive itself has been cleverly avoided. Imposing from the spectacular and decorative point of view is "Christian entering the Valley of the Shadow of Death." As more noticeable than their fellows may be mentioned, too, "The Giant Despair," "The Flatterers, the Shining One with the Whip,"

and "The Arming of Christian." Mr. Louis Rhead, notwithstanding the peculiar and deliberate mannerism of his method, shows more vitality in some minor episodes of the semi-sacred prose poem than his brother collaborators. By a certain old-world quaintness he places the Pilgrim's Progress in its own period, and affords a certain contrast and relief to its more apocalyptic episodes. Some of the borders give evidence of inventiveness of design.

IT is just seven years since the Charity Commissioners' scheme for the reconstruction of Christ's Hospital became law. But so long ago as 1877 a special commission had reported that, although unwilling to interfere with the ancient traditions and venerable memories of "this religious, Royal, and ancient foundation," removal from London was indispensable, and it was therefore decided to build near Horsham. Mr. Aston Webb and Mr. Ingress Bell were chosen as the architects out of a list of applicants numbering 131. The foundations have now been brought up to the ground line, and it is therefore possible to some extent to judge of the general effect. Briefly, the design is a complicated application of the "block" system to a group of schools—that is to say, the plan has wisely sought to dispense with ornament when usefulness and comfort became imperilled. The great hall stands in the centre. Behind the hall is a quadrangle, on the left of which is the chapel, which looks to have a few kindly reminiscences of the old hall in Newgate-street, but "oriented" north and south so as to present its long side to the quadrangle. The residential parts are evidently conceived with great attention to air and space. They comprise fourteen houses, to contain each fifty boys. The head master's house and six other masters' houses are admirably placed. The dining-hall will ultimately be capable of seating 820 boys. Communication throughout the "block" is by covered way for the masters and boys, and by subway for servants. Opposite the chapel is the library and museum. The medical officer's house and the infirmary are entirely apart from the other buildings, but quite as easy of access. The tout ensemble will not by any means be impressive, but from a distant elevation they will probably be considered imposing.

A REPORT, the recommendation of which was agreed to, was brought up at last week's meeting of the L.C.C. by the Building Acts Committee as follows: "A very important point has recently arisen with regard to proceedings in dangerous structure cases, one of the magistrates having held that the Council has no power to serve summonses by affixing them on the premises, which course has hitherto been taken in cases where the owner was not known, but that in each case the Council must discover the owner and serve the summons upon him personally, or leave it at his place of abode. The magistrate therefore declined to proceed with certain summonses which had been served by affixing to the premises. Section 188 (2) of the London Building Act provides that any notice, order, or any document to be served under the Act shall be deemed to be sufficiently served, in default of other means of service, if a copy thereof be fixed on some conspicuous part of the building to which it relates; but the magistrate's reading appears to entirely ignore the power to serve a notice or other document in this manner. The point is one which would affect many cases during the course of each year, and we think that it is exceedingly desirable than an authoritative decision upon it should be obtained. We accordingly recommend that the solicitor do apply to the High Court for a mandamus upon the magistrate to hear the summonses with which he has declined to proceed, on the ground that they were served by fixing a copy of each to the premises to which they respectively related, and were not served upon the owner in each case personally, or left at his place of abode."

ATTENTION has been called more than once during the past few months to the condition of St. Mary's Coslany, Norwich. A corre-

spondent has described the fabric as "fast falling into a deplorable state of decay," adding that he was at once "grieved and disgusted" at what he saw there. All the windows are out, and the roof is far from being weather-tight. But there is very little rubbish on the floors, and the building may be comprehensively described as looking "poor but clean." St. Mary's is described as "a fine cruciform Perpendicular church, with a tall round tower of flint, containing six bells. There are no aisles. The oldest portion of the church is the round tower and west wall, which are of the thirteenth century. Upon the west wall is the oldest mural inscription in the city. It is in Norman French, in Lombardic character." There is a curious old brass in memory of "Mistresse Ane Claxton," which reads something like this:—

Mis. Ane Claxton Here Interd Doeth Lye
Whose Vertvows Lyfe a Livinge Prayes Did
Mirit
Hir Faithe Religion Grace And charritye
Hath Crownde Hir Sowle with what te Saynts
Inherit
Foil Fowetskore Yeares She Lived Exempte
From Blame
Preserving Safe Hir Repvtations Name
From Worships Race She Did At First Desend
And Claxton's Name Did Weil That Wort
Adorne
By Whome Whilst Heaven Vnto Hir Lyfe Did
Sende
Nine Sones Five Daughters To This Worlde
Wear Borne
The First of Avgst One Thowsande Six
Hvndred and Five
She Dyed Let Still Hir Vertves Prayes Sirvive.

There were evidently a large number of brasses here at one time, but most of them have disappeared. To make the building weather-tight would involve an expenditure of at least £400, and to thoroughly restore the church and to put in stone mullions where there is at present only plaster work, in fact to restore the church to the state in which it was originally, would cost from £800 to £1000.

THE engineer to the London County Council has informed the Highways Committee of that body that there are some cracks in the Queen Victoria Street subway near the Mansion House, and also at the Blackfriars end, caused apparently by the execution of works at a lower level, but he states that it is as yet impossible to fix with any degree of certainty to what extent the subway may be affected. The Committee, recognising the fact that there are in the subway both water and gas mains, has informed the companies owning them of the circumstance, and that special facilities would be afforded them for the protection of their mains. It has been thought necessary, in order to insure swift detection of any danger of the mains being interfered with by any further subsidence, to have them kept constantly under observation, and for this purpose to employ watchmen both by day and night.

At the meeting of the City Commission of Sewers last week a motion was submitted instructing the Improvements Committee to consider a scheme for rebuilding the Finsbury Circus section of London Wall. The same Committee submitted the arrangements entered into for widening the western end of Cheapside at a cost of £69,000, for the purchase of ground leases only. The Streets Committee recommends that permission be given to the Central London Railway to construct a staircase at the corner of Queen Victoria Street and Poultry.

A CORRESPONDENT writes: "The building adjoining St. Martin's Town Hall at the corner of St. Martin's Lane, formerly the offices of the National Provident Institution, and now in the occupation of the Technical Education Board, is probably not of sufficient antiquity to warrant the interference of the Society for the Protection of Ancient Buildings, but is of sufficient interest to merit a word for its preservation. The building, which is faced with Portland stone, was

erected some thirty years ago, and the front had acquired an agreeable and harmonious tone. The Technical Education Board, apparently dissatisfied with the appearance of the front, has had the stonework of the ground floor cleaned, with disastrous effect, making the building look like a public-house or a music-hall. The Technical Education Board has two advisers on artistic matters, and it would be interesting to know whether Mr. Frampton or Mr. Lechaby have been consulted with regard to this work. The flaying of our London buildings is a serious matter, and it is high time that public attention should be called to the practice."

A NUMBER of Roman antiquities were found last week between two spurs of the Pyrenées at Martres Tolosane on the Garonne. They were brought to light in the digging of foundations. There are in all seventeen statues, and a lovely bust of a woman, and numerous hands and feet—in short, quite a museum. Among the seventeen marbles are a Mars, a Minerva of severe countenance—for the Roman conception of divine wisdom was sterner than the Greek—and an Adonis with long hair. A hundred years ago some other Roman works of Art were ploughed up half-a-mile away. In 1826 there was a sudden land-sinking in a garden at Martres Tolosane. It was caused by the falling in of a vault where a number of antique marbles were evidently stored—perhaps the studio of a sculptor of the Gallo-Roman time.

THE accompanying illustration represents a banner shown by Messrs. Jonathan Harris and Sons, Limited, of Cockermouth, at the recent Ecclesiastical Art Exhibition at Nottingham.

There is a soft delicacy and fine artistic touch in the design which is scarcely fully expressed in our illustration.

At a meeting of the Art Gallery Committee of the Bury Town Council, held to receive the report of the assessor (Mr. R. Knill Freeman, F.R.I.B.A.) in the Art Galleries Competition, it was reported that twenty-two sets of plans had been sent in, consisting of 109 separate drawings. Favourable reports were made of seven, viz.:—Motto: Mezzotint, submitted by Messrs. Woodhouse and Willoughby, Manchester; octagon: Messrs. Cheers and Smith, Blackburn; plan: Mr. John Johnson, London; diadem: Messrs. Gibson and Russell, London; star in a circle: Mr. F. J. Parkinson, Blackburn; simnel: Messrs. Maxwell and Tuke, Manchester; ballon d'essai: Messrs. J. D. and S. J. Mould, Bury and Manchester. It was recommended that the three premiums be awarded as follows:—1 mezzotint, 2 octagon, 3 plan, and decided that the Art Gallery Committee

meet at a later date to decide which of the pre-miated designs be recommended to the Council for adoption. The amounts of the premiums are £75, £50, and £25.

THE Norwich magistrates have made an order authorising the City Engineer to pull down such portions of the boundary and other walls of St. Swithin's Church as, in his opinion, will make them safe to passers-by. Bad as the exterior is, and it is very bad indeed, the interior is, if possible, still worse. Wet is to be seen everywhere, and the daylight peeps freely through the chancel roof. The east window was a comparatively modern one, and once contained two small portions of ancient stained glass, bearing symbolic representations of the Sacred Trinity and the Blessed Sacrament. But the glass is all gone, and no trace now remains of the east window except the hole in the wall and some of the old lead. The altar-piece is, or was, a painting representing Moses and Aaron, but a canvas, almost devoid of outline, blankly faces the clock in the gallery, which has stopped at twenty minutes to six. The organ still stands in its old place in front of the south wall, and quite close to the altar rails. The altar itself has been dismantled, and stands naked and bare amidst surroundings all reeking with wet. The pulpit is still high and dry, and the old-fashioned box pews have been stripped of their kneelers, which are used for the purpose of propping up some old pieces of wood against the window places on the north side (the dangerous side), the windows being all out. The font is of stone, and is carved with emblems of the Trinity, and with the arms of East Anglia, but it is now used as a receptacle for odds and ends. In the north-east corner of the building is a collection of old metal. The débris consists of the old bells and of an old stove, together with a number of mouldy hassocks. The stove is a common one, but the bells appear to be sound and good. They were taken down from the old square tower, which was removed several years ago by the City Engineer on account of its dangerous condition. There are several brasses still remaining, as well as a large number of mural tablets. It would seem that in former years many persons were buried within the walls of the church.

DELMONICO's, the one American restaurant of international reputation, is shortly to be removed from its old situation at the corner of Twenty-sixth Street, with a frontage both on the Broadway and Fifth Avenue, to Forty-fourth Street and Fifth Avenue. The new building will be quite different architecturally from the low and incommensurable brown stone one which has been the rendezvous of fashionable American life for so long, for it is designed in the manner of the Italian Renaissance, but adapted to modern uses. It is a four-story building, the main front of which on Forty-fourth Street measures 140ft., while the frontage on Fifth Avenue is 44ft., and is of a cream white made by a combination of terracotta, lime stone, and brick.

THE recent recovery of some remains of the famous triremes of the Emperor Tiberius, which lie at the bottom of Lake Nemi, is of great interest both to artists and antiquaries. The lake of Nemi, which is situated about seventeen miles south-east of Rome, is formed by the crater of an extinct volcano. Upon its broad bosom once floated the magnificent pleasure-house of the luxurious and licentious Emperor, Tiberius Claudius Nero, who, leaving his duties at Rome in the year A.D. 26, retired the year following to the island of Capree. His love of luxury and display was exhibited in the two famous pleasure triremes which bear his name, and the remains of which now lie buried in the lake of Nemi. The discovery referred to consists of the finding of several massive metal mooring-rings and tops of stakes by which the vessel could be moored to the quay. The rings are fixed in the mouths of bronze heads of lions, wolves, and Meduse, by the teeth of which they are retained in their proper places. These bronze heads are marvellously modelled, and the faces are

characterised by a life-like similarity to the animals represented. Despite their long immersion in the mud of Lake Nemi, they are all perfectly preserved, and the massiveness of their build and the beauty of their outline enable the spectator to judge of the magnificence of the structure of which they once formed but a secondary and almost insignificant part. It is said that the trireme to which these ornamental mooring-rings belonged was that dedicated to the worship of the goddess Diana, but about this and other points connected with these submerged vessels there had been recently a good deal of discussion. What is certain, however, is the fact that last week the Court of Rome ordered the castle and the lake of Nemi to be offered by public auction for debt. The sale of the Nemi estate will doubtless include the remains of the famous Tiberian vessels which now lie at the bottom of the lake.

In giving hints for beginners in architectural photography, the Amateur Photographer says: "The beginner in photography, like the beginner in other things, is usually ambitious, and thinks he will achieve the best possible results during his first few weeks. He generally starts off with portraiture, or some other different branch of the subject; but he will be wise to confine his earlier attempts to buildings, which are perfectly steady during the period of exposure, are always to be found when wanted, and, again, do not give a man a black eye for producing a caricature in place of a portrait. Even so, however, it is not to be expected that very high class work will be done at first, for there are certainly several difficulties to be overcome, which, however, are of such a character as to give the beginner an ample insight into the use of the different parts of his apparatus, and consequently a control over future results, whatever be the branch of photography he may ultimately take up specially."

THE Finance Committee of the London County Council, to whom, since the abolition of the Works Committee, the duty has been delegated of controlling the finances of the Works Department, has just issued a report, which contains a statement showing (1) the estimated and actual cost of works executed during the half year ended March 31st, 1897, and (2) the totals or the actual cost and of the final estimates, or the amount of the schedule value, of all works executed by the Works Department since its creation. In all thirteen estimated works have been completed and reported during the half year. The total of the original estimate for these works was £23,525, the final estimate being £24,099, and the actual cost £25,563, showing a balance of cost above estimate of £1463. The loss on the half year has been solely occasioned by the work on the extension of the Wandle branch sewer, for which the final estimate was £9665, and the actual cost has been £12,011, or a balance of cost above estimate of £2006. There is a slight excess in cost over estimate in two or three of the other items, but an analysis of the table shows that there has been considerable saving on some of the works. This has been the case particularly in the work done for the Housing of the Working Classes Committee. The central laundry in the Boundary Street area, which was estimated to cost £6532, has been constructed for £6103, showing a saving of £429, whilst on the construction of a sewer on the same estate, estimated to cost £1454, a saving of over £300 has been effected. Small works executed for the Fire Brigade Committee also show satisfactory results. The table detailing the cost of jobbing works carried out during the half-year by the Department for the different committees of the Council gives the schedule value of the works as £16,758, and the actual cost as £15,869, showing a balance of cost below schedule value of £889. The value of the jobbing work done for the Bridges Committee was put at £2443 and the actual cost was £2185, for the Fire Brigade Committee £2877 and the actual cost £2772, for the Main Drainage Committee £6670 and the actual cost £6300, and for the Highways Committee

£1354 and the actual cost £1284. An interesting statement follows showing the totals of the actual cost and of the final estimates, or the amount of the schedule value, of all works executed by the Works Department since its creation. This shows that up to March 31st of this year the final estimate for all the estimated works carried out by the Department was £459,772, and the actual cost £462,897, making a balance of cost above estimate of £3125. The schedule value of jobbing works executed from April, 1895, when the system of a schedule of prices was first tried, to March 31st, 1897, was £56,176, and the actual cost £52,260, showing a balance of cost below schedule value of £3915.

MR. PAUL RAMOND writes with reference to a supposed antiquarian discovery at Birkenhead Priory: "With your kind permission I will give a few interesting facts about the Priory that may be interesting to your numerous readers. The Priory was founded by Hamon de Masci in the year 1150, in honour of St. Mary and St. James, for sixteen of the monks of the Benedictine order, and was an auxiliary of St. Werburgh's, Chester, now the cathedral of that city. Many charters were granted to the monks, amongst others, one by King Edward III., in 1332, conveyed the right of ferryage from Birkenhead to Liverpool. The landing-place may be traced in Birkenhead to this day. A discovery among the ruins took place in 1818 that will interest those of an antiquated turn of mind. An ancient gravestone was discovered during excavations, as well as three skeletons in a good state of preservation. The stone, which is now inserted in the outer wall of the Lady Chapel, can now be seen, and bears the following inscription:—'Here lieth the good vicar of this house, who died 14th May, 1473, Thomas Rainford, on whose soul may God have mercy.' The stone is of red granite, and the inscription is in Latin, the above being a translation. If the Birkenhead Priory was many miles away it would probably be better known, but, being in our midst, people are apt to forget that such a grand old monument of the middle ages exists at our very door."

THE recent report issued by the Executive Committee in charge of the fund for the exploration of the Roman town at Silchester, near Reading, contains some interesting reading. During the seven years since the fund was established, the excavations have brought to light twenty-five complete houses and parts of others, a private bathing establishment, a Christian church, two temples, remains of the west gate, and a series of buildings which the authorities believe to have been extensive dye works. The north and south gates have been re-examined, and another small gate has been found on the west side. The whole of the very valuable and interesting antiquities, together with a quantity of the architectural remains, have been placed in the Reading Museum.

FOR many years Paris has been familiar with "synchronised clocks" worked on the pneumatic system. They are to be found everywhere; they are part and parcel of the street life of Paris, and not the least of the accessories which make that life so pleasant. The first step which will bring London into line with the metropolis of our neighbours has at last been taken. London has now a clock—the pioneer clock, it is to be hoped, of hundreds to follow—which tells the time of day or night without requiring winding up, being controlled by a self-wound electric pendulum in the neighbourhood, which also works a number of smaller dials on each side of Regent Street. The pioneer electric clock is fixed high up on the frontage of Piccadilly Circus, adjacent to the Criterion. The hours on the dial are marked by twelve fixed star-like electric lights, and the hands themselves are studded with other electric lights, and a very pretty object it is at night. The hands move forward with each half-minute of Greenwich mean time, and the entire mechanism consists only of the dial, the hands, and a single wheel, with an electric magnet to work it.

THE R.I.B.A. has just inaugurated an innovation—it has announced the list of meetings and papers to be read thereat, together with the dates of the meetings throughout the forthcoming session. The list is as follows:—November 1st, first general meeting, President's address. November 15th, "Notes on Renaissance Architecture in Malta, with special reference to the buildings of the Order of St. John," by Mr. A. S. Flower, M.A., F.S.A. November 29th, business meeting. December 13th, "Brickwork Tests: report on the third series of experiments," by members of the Science Standing Committee. January 17th, award of prizes and studentships, preceded by business meeting. January 24th, President's address to students: presentation of prizes. February 7th, "The Housing of the Drama," by Mr. E. O. Sachs. February 21st, "The Mediæval Campanile at Rome," by Mr. J. Tavenor Perry. March 7th, Business, including election of Royal Gold Medallist. March 21st, "The Heraldry of Antiquity," by Mr. G. H. Birch, F.S.A.; and "Heraldic Drawing," by Mr. J. D. Crace. April 4th, "Artistic Copyright," by M. G. Harmand, Avocat à la Cour d'Appel, Paris. April 18th, "Domestic Architecture in the United States," by Mr. A. N. Paterson, M.A. May 2nd, annual general meeting. May 16th, "The Libraries of the Middle Ages," by Mr. T. G. Jackson, R.A. June 6th, business: annual elections. June 20th, presentation of the Royal Gold Medal: address by the President.

At a Court of Common Council the Lord Mayor submitted a letter from Mr. D. P. Sellar, of Glen Doll Forest, Kirriemuir, and of Brentwood, Essex, offering to the Corporation the gift of 200 paintings by old English, Dutch, and Italian masters, and suggesting that his Lordship, with the President of the Royal Academy, should pay him an early visit for the purpose of seeing the works of Art. This handsome offer was accepted with the thanks of the Court.—A large deputation of ratepayers of the Coleman Street ward attended the Court, and were heard as to their serious objections to a printed scheme of the Bridge House Estates Committee for "improving" premises in Finsbury Circus, West Street, London Wall, and the neighbourhood. Eventually the question was adjourned for a fortnight to allow the residents time, which they alleged had not been afforded them, to express their views with reference to the matter in the form of a memorial.

THE Egypt Exploration Fund will issue to its subscribers in a few days the Archaeological Report for 1896-7, which, besides the usual review of progress in all departments of Egyptology during the past year, will contain a full account by Mr. B. P. Grenfell of his excavations at Behneseh (Oxyrhynchus), which resulted in the discovery of the "Logia;" and also a collation by Mr. A. S. Hunt of some four chapters of Thucydides from a first century papyrus, found at the same time.

A VERY interesting discovery of Roman coins at Okehampton links the ancient borough more closely with the past. About three weeks ago one of the road contractors (Mr. R. Furze) was at work on the Okehampton Park, a little distance above the railway station, when about three feet under the ground he came across a hoard of Roman coins to the number of 130. The Rev. S. Baring-Gould, who, as secretary of the Dartmoor Exploration Society, was keenly interested, after a most exhaustive search succeeded in unearthing forty additional coins, making a total of 170. The coins are of the third brass series, and are nearly all of the reign of Constantine—early in the fourth century. The chief value of the coins lies in the fact that they are the first remains of Roman times found on Dartmoor. It has long been a point of dispute among authorities on the subject if the remains of the old camp on Dartmoor are Roman or British; but the finding of the coins on Dartmoor does not prove the presence of the Romans on the spot, notwithstanding the so-called remains of the Roman road and camp.

Surveying and Sanitary SUPPLEMENT.

OCTOBER 27TH, 1897.

Practical Carpentry and Joinery.*

By GEO. ELLIS.

(Continued from page 197.)

ROOFS.—In dealing with this important subject, the space at my disposal prevents any reference to the theory, of the composition and resolution of forces involved in the designing of framed trusses, and, therefore, these remarks are confined to the practical details connected with the examples given, which are typical of the varieties met with in ordinary practice.

THE LEAN-TO (Fig 28) is the simplest form of roof it is possible to construct, and consists of a number of rafters birdsmouthed at each end on to wall plates. The top plate is either built into the wall of the main building, or rests on bricks corbelled out therefrom, every few feet; as indicated by dotted lines in the Fig. Sometimes they are fixed by wall hooks driven in the joints, with the ends turned up square to grip the plate.

THE COUPLE ROOF (Fig. 29) is formed with two sets of rafters pitched against each other, their lower ends fixed to the wall plates; the ridge-board being introduced between their top ends to steady them and facilitate fixing. This form of roof having a strong tendency to push out the walls, should not be used for greater spans than 11ft., or the weight would become excessive. Suitable scantlings for spans up to 8ft., are: Rafters, 2½in. by 2in.; ridge, 7in. by 1½in.; span, 11ft.; rafters, 4in. by 2½in.; ridge, 7in. by 1½in.

THE COUPLE-CLOSE ROOF, Fig. 30, is formed by nailing ceiling joists to the feet of the rafters, and they should be fixed also to the wall plates for additional security. This form and the V-Roof (Fig. 31), in which the party walls of the adjoining houses take the place of ridge boards, the feet of the rafters being carried by the gutter-plate (the ends of this plate are built into the front and back walls and the framed partition supports the middle) are much used for cottages, the latter form, when the front wall is carried up to the height of the party wall, is known as a "parapet front roof." This class of roofs are frequently

used for spans up to 22ft., and when used with slate coverings at a pitch of not less than 45° may be considered safe, but for heavier coverings and lower pitches 18ft. should be the limit of span. Scantlings, 14ft. span; rafters, 4½in. by 2in.; ridge, 7½in. by 1½in.; span, 18ft.; rafters, 5in. by 2in.; ridge, 8in. by 1½in.; ceiling joists, 4in. by 1½in. or 3½in. by 2in.

THE COLLAR-BEAM ROOF, Fig. 30, is also used to illustrate this roof, the dotted lines indicating the collar-beam. This form of roof is useful, as it increases the available height for room space. The collar, G, should not be more than one-third the rise above the wall plates, as it acts as a strut to the upper part, the weight of which will bend the rafters lower down and thrust the walls out. It is advisable to nail the collars on the rafters, as notching them in weakens the latter; when,

incident to its construction, and the pressure due to the weight of covering, &c., are met by the smallest number of parts, so arranged that it shall be rigid and unalterable, composing the various thrusts into a dead weight upon the walls.

THE KING-POST TRUSS, of which Fig. 32 is a type, approximates most closely to these requirements. This is composed of two principal rafters, P R, which are prevented from spreading by framing their feet into the tie beam, T, and suspending between their upper ends the king post, K, which in turn supports the tie beam at the middle, for it must be borne in mind that the king-post does not rest upon the tie beam, but is cut short, and the tie beam brought up to its foot by a strap or bolt, the usual allowance being ½in.; this counteracts the sagging that would otherwise take place when the truss is set up, and the joints

FIG. 32. KING-POST TRUSS.

however, they are notched in the best method is shown in Fig. 30A.

In spans of greater width than 18ft. or 20ft. the rafters bend with the weight, and require support, this is accomplished by arranging strong frames, called trusses, under them, about 8ft. or 10ft. apart. Across these stout timbers, called purlins, are laid, that take the weight of the rafters in the middle, and collect it upon the trusses. These transmit it to the walls in a vertical direction. The weight is distributed over the whole bearing surface of the walls by means of the wall-plates; these further, when copped into the horizontal member of the truss, acting as a tie to the walls. The ideal truss is one in which all the stresses

have taken their bearings. The tie beam should not be cambered more than this, or its tendency will be to push the walls out when it settles; any unsightliness through subsequent sagging that may be feared should be met by sinking the ceiling joists deeper towards the middle. The principals are supported immediately under the purlins, P U, by struts, S, springing from the foot of the king-post, that is cut out as shown to receive them, and also the heads of the principals. This is called "joggling"; the piece left on to form the abutment is termed the joggle; these pieces should not be made wider than 2in., or the amount of shrinkage will be sufficient to make the struts short eventually, however well

Fig. 36. DETAILS AT HEAD OF QUEEN-POST.

fitted at first; all the shoulders and abutments should be cut at right angles to the directions of the strains, which are indicated by the arrows in Fig. 32. The joints should all be made with mortice and tenon, the tenons a quarter of the thickness, but not of any great length, 1in. will usually suffice. Their object simply being to prevent side movement, deep mortices unnecessarily weaken the tie beam and king-post. Above all, see that no mortice is sunk into the body of the king-post as if calculated at a minimum scantling, to do so would seriously weaken it. When ceiling joists are used they should be notched on, not into, the tie beam, as in that case the under edge of the beam will be in tension, and parts in tension should never be cut into; and for the same reason straps are preferable to bolts for drawing up the tie beam. The purlins must be coggled on to the backs of the principals, and used in as long lengths as possible, as they then become beams fixed at both ends, and the increase of strength as compared with the same timbers framed between the principals is as 3 to 2. The ridge-board, R, carries the top ends of the common rafters, CR, and is notched down into the king-post, thereby steadying the top parts of the trusses. The common rafters in low pitches should either be stump tenoned into the ridge-board or notched over an inch fillet nailed on its side, their lower ends birds-mouthed to a wall-plate, as in Fig. 33, or to a pole-plate, P, Fig. 32, which is spiked on the ends of the tie beams; they ought also to be coggled or notched to the backs of the purlins. In Figs. 34 and 35 are shown enlarged details of the joints and strap at the foot of the king-post. The strap is of wrought-iron, 2in. by 1/4in., with slots for the insertion of the jibs and cottars to draw up the tie beam; the mortice in the king-post must be kept as much higher than the slot in the strap as the post is cut short. Heel straps may be used with advantage at the feet of principal rafters (and the more they approach the horizontal the better (see Fig. 33), but they are unnecessary at the heads of the principals or the struts as these will never shift if properly framed. The tie beam is coggled on to the wall-plate, as shown in Fig. 37, and the best position for the latter is the centre of the wall to which it is

secured by bedding in cement. It is usual to make all members of a truss of equal thickness throughout, as more convenient in construction, although occasionally this gives an excess of strength in the struts. A ready way of finding the necessary thickness of a truss is to divide the span by five and call the quotient inches, this will give the thickness required; make the struts square, and the principal rafters and the body of the king-post an inch wider than the thickness; for the depth of the tie beam, assume 9in. as a standard for a 20ft. span, and for each 5ft. additional, add 1in. to the depth.

THE QUEEN-POST TRUSS (Fig. 33) is used for spans of upwards of 30ft., as the unsupported length of the tie beam should not exceed 15ft., or of the common rafters 8ft. There are two suspending pieces in this truss. The queen's, kept apart at the head and foot respectively, by the straining beam and the straining sill; when the extent of the span will not permit of the above conditions being fulfilled additional suspending pieces must be inserted, as shown in dotted lines in the drawing. These are called princesses; a king-post can also be placed over the straining beam to support its middle and collect the weight of the roof above the purlins. Roofs of great span are, however, now usually made of iron, as they can be made much lighter and more economically than of wood. The description of them does not come within the scope of these articles, but it may be mentioned that wrought-iron bolts may be substituted for king and queen posts with advantage in wood trusses. A similar method may be used to ascertain the dimensions of the timbers for the queen truss, as advised for the king-post—viz.: divide the span by 8, and the quotient will give the thickness in inches; add 1in. for tiled roofs; any fraction less than 1/2in. may be discarded for slate roofs. The standard depths for 32ft. span are—tie beam, 11in.; principals, 6in.; add 1in. for each 5ft. of span additional, the queens to be 1in. wider than thickness. The best form for straining beam is to make it so that its depth to its thickness is as 10 to 7.

(To be continued.)

THE Commissioners of Sewers have resolved to acquire the ground leases of Nos. 1 to 4, Cheapside, and 51, Newgate Street, held by Messrs. Fandel-Phillips and Company, for the sum of £69,000, for the purpose of effecting an improvement at the western end of Cheapside, extending from Newgate Street to Paternoster Row.

MR. JOHN A. LANGSTON writes: "As a means of ventilating the Metropolitan Railway, would it not be advisable to remove all the roofs from all the stations, thus making each station an air shaft? Low platform coverings for the comfort of passengers could be substituted. Let this be tried before making any more blowholes."

IMPROVEMENTS AT POPLAR HOSPITAL.

THAT the public mortality decreases year by year is a well-known fact, and that as much credit is due to improved sanitary arrangements as to greater medical skill, is generally conceded. In a recently published technical work the author states as his opinion that the time is fast approaching when medical men will acknowledge that the improved state of the public health is due as much to architects as to themselves; and we are prepared to heartily endorse this opinion after inspecting the new wings at Poplar Hospital, just completed under the superintendence of Mr. Rowland Plumble. The supervision of the work was entrusted to that veteran clerk of works, Mr. Sutton, who conducted us over the works. The Poplar Hospital, although not the largest, is one of the best managed Hospitals in London. We were much struck with the extreme cleanliness displayed everywhere. The old portion of the Hospital had been re-painted and decorated throughout; the ceiling and walls, &c., in the basement mostly being painted with pleasing yellow or grey tints. Many of these rooms are provided

Fig. 34. DETAILS OF FOOT OF KING-POST (ELEVATION).

Fig. 35. SECTION.

with sinks and water fittings. It was pointed out to us that should a pipe require attention there was no excuse for the workmen commencing upon the wrong one (none of which were of course embedded in the walls), because each was painted a special colour according to the different purpose for which it was used.

THE OLD WARDS

have also been freshly done up; the walls of these had previously been plastered with Keen's Cement and polished, and although beautifully white when first done, gradually grew yellow, patchy and unsightly; and have therefore been painted and varnished with a dark green dado surmounted by a very pale green filling, producing a most soothing effect. We noticed in these old wards the excellent condition of the teak polished floors with concave teak fillets, about 3in. by 3in., in lieu of skirting. There was also a coving of a similar description upon the ceiling, sharp corners into which it is difficult to get a brush, and which harbour dust and microbes, being avoided in every case. The dormitory stoves, standing in the centre of the ward without any visible chimney, strike the uninitiated as strange; each stove contains two fires, one at each end, enabling the patients to see the cheerful blaze from any part of the ward, the smoke being conveyed away under the floor by 9in.

FLUE PIPES ENCASED IN CONCRETE,

supported by 12in. by 12in. iron joists, one flue running to the right and one to the left until, after passing through the walls, they enter a chimney in the ordinary way. Upon the second floor we saw an example of what

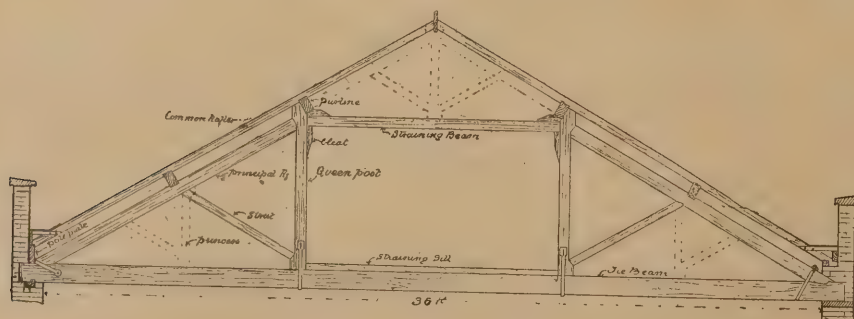

Fig. 33. QUEEN-POST TRUSS.

can be done in transforming a small box or ante-room into a comfortable apartment. The doorway of the small room in question opened out into a wide passage just where the same formed a junction with a wider landing, similar to the head of a T-square. Advantage was taken of this space, by a clever arrangement of door linings and shelves, to form narrow bookcases, which projected this doorway out upon the landing about 2ft., the shaped overdoor and the Lincrusta Walton panelling forming quite an improvement,

FIG. 37. SKETCH OF COGGING JOIST.

whilst inside the room, the bookcase arrangements and the high Lincrusta Walton dado, in imitation of wainscoting painted flat white with a dark green filling, formed a pleasant sitting and reading room. Interesting, however, as these decorative improvements were, the real purpose of our visit was to see the structural alterations which entitle the Hospital to claim the possession of the most complete and up to date operating theatre in London. This is situated upon the first floor, on a level with the principal wards. A large proportion of one side of this apartment is formed by casements surmounted by a glass roof, a nice soft light being obtained, chiefly reflected from a gable wall faced with white "Opalite," which, contrary to the expectations of certain fault-finders, has withstood the action of frosts throughout the whole of last winter without the slightest injury. Passing through another pair of doors we found ourselves in the new Operating Theatre. The plan is octagonal, the principal portion of the light being obtained from above. The roof is domed for half the distance up, and surmounted by a lantern light glazed with chequered glass. The sides of this lantern light are fitted with sashes hung upon centres for ventilation, and there are also two Boyles' exhaust ventilators fixed upon the top of the same, and ingress gratings with flues and ventilators fitted in the walls on either side. The under-side of the rafters are covered with zinc Emdeca plates enamelled a light pattern. The floor is mosaic, brought up the walls about 3-in. in the form of a coving in lieu of skirting; sharp corners being avoided in every part. The walls are covered with "Opalite," this new material being a favourite with the eminent architect, and justly so. When we had occasion several years back to study the manufacture of glazed bricks, we found that to obtain a perfect glaze was an impossibility, and anyone who examines a glazed brick very closely will find small holes in the glaze, and if you spread a little ink upon it you will find that if allowed to remain for a time it will soak in and form a dark ring round each of these small pin-holes, thus showing that the glaze, which is really a thin film of glass, does not always become thoroughly incorporated with the brick, and it also easily chips off, especially at the edges. Here, however, was a material, the glaze of which was perfect, without a hole into which the finest needle-point could penetrate or the most microscopical of microbes take up its

abode, and the delicate tints and reflective capacity of which far surpassed that of the finest glazed brick which it is possible to obtain; the joints too being so close that a thin knife-blade could not be inserted. In one corner of the theatre we noticed a lavatory fitted with silvered taps which can be worked without using the hands, by pressure up on pedals with the foot, hot or cold water thus being turned on or the dirty water run off. This arrangement is of undoubted value to a doctor who has just been operating. The theatre is lighted by several surprise pendants, fitted with incandescent burners and mantles; the mechanism of these pendants is just the thing required here, for not only do they slide up and down from the ceiling, but, being fitted with universal joints, can be twisted round in any direction, and having a counterbalancing arm, the flame can be adjusted to any angle by a slight touch. The Examining Room, on the ground floor, is a spacious apartment, part of it being in the old building, the comparatively low, flat ceiling of which portion was covered with zinc Emdeca plates, enamelled in a pleasing pattern in light colours. The outer walls, forming

THE NEW ADDITION

to this room, are composed of deal framing and casements upon a brick foundation, surmounted by a lantern light, and the whole glazed with chequered glass which admits plenty of light, and by opening the side ventilators an unlimited quantity of air can be obtained. The walls are covered with "Opalite," a blue dado being surmounted by a brown border and white filling. A slow combustion stove with green tiles is fixed in this apartment; while the fittings, whether they are the copper sterilising apparatuses, glass shelves, enamelled sinks with their brass taps, for both hot and cold water, all glisten and sparkle with cleanliness. The alterations we have been describing are all extensions to, or improvements in the old building.

THE NEW ISOLATION WARDS,

however, are an entirely new erection. To reach them it is necessary to pass outside the old building. The entrance to the new building containing these Isolation Wards is approached through a covered way, open at the sides. The exterior is substantial but plain, but the beauty of the interior is a thing to be admired. The floors are mosaic

are all of white earthenware, the cocks and fittings being of brass. In one of the lavatories we noticed that the water pipes ran down the face of the wall, and were enclosed by a slate casing. Instead of this being painted, sheets of "Opalite" had been fixed to it, producing an effect similar to the other parts of the walls; this of course could not have been done with glazed bricks or tiles, and although it might seem to some people a trivial advantage, it is these small arrangements which lead in the direction of perfection in architectural decoration.

Surveying and Sanitary Notes.

THE foundation-stone was laid last week of the commercial port which is to be built at Vladivostock.

AN indication that the improvement in Whitehall, London, has entered upon a serious phase is furnished by the fact that the principal part of the block of buildings on the north side of the street is advertised for immediate sale for demolition. Each house is divided into sections, and the windows of each section are numbered in huge letters according to the catalogue. This gives to the street an extraordinary appearance of desolation, which is heightened by the fact that the authorities have come to the conclusion that the moment is an opportune one for repaving the road.

MR. A. F. TERRELL SHAPLAND writes from Withycombe House, near Exmouth:—"Will you allow me, a new resident within the urban district of Exmouth, to call the attention of the Local Government Board and the public to the present sad state of Exmouth? According to the last report of the medical officer, we have had in three months twenty-seven cases of typhoid, three of diphtheria, and forty-nine of measles. I believe it is generally admitted that the drainage is very bad and the sewers are badly ventilated, and yet the authorities have been for months and are still considering what to do. At the last meeting Mr. Ley, a former chairman, a retired medical gentleman of local note, and indeed the most public man in the town, actually admitted

FIG. 38. PLAN DIAGRAM OF HIPPED ROOF.

throughout, being made with a concave coving or filleting, as before described in the Operating Theatre; and the walls covered with "Opalite" in various tints, corners in every case being avoided, both at the angles of the rooms and round the ceilings. The building is warmed throughout by radiators. Hydrants are fixed upon every floor, and the nature of the materials used for floors, ceilings, and walls are of such a nature that they can be sluiced with water and disinfectants at any time without damage. The baths, sinks, and basins

that 'they did not know what to do!' Surely, sir, if the authorities admit this, is it not time that the Local Government Board, ere too late, taught them their duty, or shall we wait till we get like unhappy Maidstone before anything is done? Are there no surveyors of eminence in this country able to deal with this question? In addition to the above, our water supply comes from a sheet of water on the Common, and not being walled in or fenced is liable to be polluted by man or beast. Exmouth must be 100 years behind the age."

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Oct. 30	Christchurch, Hants—Workhouse Addition	Guardians	A. Druitt, Clerk, Christchurch.
" 30	Falmouth—Infirmary	Guardians	J. H. Genn, Clerk, Falmouth.
" 30	Horrabridge, Devon—School Alterations	Whitchurch School Board	W. Squire, Architect, Tavistock.
" 30	Cardigan—Four Dwelling-houses		Captain T. Williams, Catherine-row, Cardigan.
" 30	Chelmsford—Cottage Residence		G. E. Clare, 66, Duke-street, Chelmsford.
" 30	Redruth—Farmhouse	A. Knucky	S. Hill, Architect, Green-lane, Redruth.
" 30	Truro—Technical Schools	Passmore Edwards	A. Blenkinsop, Secretary, Truro.
" 31	Wrexham—Latrines	County School Governors	J. Morison and Son, 10, King-street, Wrexham.
Nov. 1	Manorhamilton, Ireland—Repairs		E. O'N. Clarke, County Surveyor, Carrick-on-Shannon.
" 1	Barry Dock, Wales—Offices	Barry Railway Company	Company's Engineer, Barry Dock.
" 1	Hornchurch—School, &c.	School Board	E. M. Whittaker, 1, Gresham-buildings, Basinghall-st., E.C.
" 1	Bideford—Alterations, &c.		R. T. Hookway, 12, Bridgeland-street, Bideford.
" 1	Frizinghall, Bradford—Pair of Semi-detached Villas		Isitt, Adkin, and Hill, Prudential-buildings, Bradford.
" 1	Gosport—Public-house		A. H. Bone, Architect, Cambridge Junction, Portsmouth.
" 2	Brighton—Buildings	Guardians	H. S. Reed, Offices, Princes-street, Brighton.
" 2	Chelsea, W.—Meat Store, &c., at Infirmary	Guardians	Landsell and Harrison, 12, Compton-terrace, Highbury, N.
" 2	Droitwich—Passenger Station	Great Western Railway Co.	Engineer, Paddington Station, London.
" 3	Farnham—Joint Isolation Hospital		S. Stapley, West-street, Farnham.
" 3	Barnes, S.W.—Six Shops and Dwelling-houses		F. and W. Stocker, 90 and 91, Queen's-st., Cheapside, E.C.
" 3	Hull—Workhouse Kitchens, &c.	Guardians	T. Beecroft Atkinson, 11, Trinity House-lane, Hull.
" 3	Lanchester—Shop	Guardians	G. T. Wilson, 121, Durham-road, Blackhill.
" 3	Llanwano, Wales—School Extension	School Board	A. O. Evans, Post Office-chambers, Pontypridd.
" 5	Bedford—Post Office	Commissioners H.M. Works	Office, 12, Whitehall-place, S.W.
" 5	Limerick—Tiling Kitchen	Free Library Committee	W. E. Corbett, 28, Glentworth-street, Limerick.
" 5	Winchfield, Hants.—Cottage Home	Guardians	F. S. Chandler, Clerk, Union House, Winchfield.
" 9	Maryport—School Enlargement	School Board	C. Eaglesfield, Architect, Maryport.
" 9	Sheffield—Stables, &c.	Corporation	C. F. Wike, City Surveyor, Town Hall, Sheffield.
" 10	Homerton, N.E.—Alterations to Children's Homes	Hackney Union	F. R. Coles, Clerk, Hackney Union, Homerton, N.E.
" 15	Horsey—Central Library	Urban District Council	E. J. Lovegrove, Surveyor, Southwood-lane, Highgate, N.
No date.	Batley—Alterations	J. B. Jubb and Co.	J. B. Jubb and Co., Union Mills, Batley.
"	Fahan, Ireland—Chancel		J. E. Walsh, Bishop-street, Londonderry.
"	Leeds—Villas		G. Hutton, 72, Albion-street, Leeds.
"	London—Synagogue		M. Goldstein, 26, Whitechapel-road, E.
"	London, E.—School Repairs	Guardians of Mile End Old Town	W. Thacker, Clerk, Bancroft-road, Mile End, E.
"	Shrewsbury—Additions to Premises	Industrial Co-operative Society, Ltd.	Architect, Co-operative Wholesale Soc., Ltd., Manchester.
"	Douglas—School	School Committee	J. M. Bottomley, 46, Albion-street, Leeds.
"	Market Harbro'—Store Buildings		Coales and Johnson, Corn Exchange, Market Harbro'.
"	Leeds—Workhouse Alterations	Guardians	J. M. Bottomley, 46, Albion-street, Leeds.
ENGINEERING—			
Oct. 30	Sheffield—Retorts, &c.	United Gaslight Company	F. W. Stevenson, Company's Engineer, Sheffield.
" 31	Bolton Colliery, Durham—Putting up and Walling Staple		Boldon Colliery Office, Durham.
" 31	Manchester—Hydraulic Machinery	Directors of Sackville Estate Co., Ltd.	Sackville Estate Co., Ltd., 60, King-street, Manchester.
Nov. 1	Garth, Llangollen—Heating Apparatus		R. M. Davies, Garth, Llangollen.
" 2	London, E.C.—Engines, &c.	Shoreditch Vestry	Kincaid, Waller, and Manville, 29, Great George-street, S.W.
" 2	Wexford—Three Conical Buoys	Harbour Commissioners	J. F. Walsh, Secretary, Ballast Office, Wexford.
" 2	Barking—Fire Engine, &c.	Urban District Council	Public Offices, Barking.
" 5	Hull—Electrical Equipment of Tramways	Corporation	A. B. White, City Engineer, Town Hall, Hull.

LESSONS FROM THE PARIS CHARITY BAZAAR FIRE.*

BY EDWIN O. SACHS.

Author of "Modern Opera Houses and Theatres."

I AM going to recall some of the facts of the recent Paris Bazaar Fire, and I shall be doing so before the members of the Profession with whom to a great extent will rest the responsibility of future catastrophes of this description. For no profession is so closely associated with the erection of our dwellings, our public halls, our places of public entertainment, and all those many kinds of structures, not forgetting places of worship, amid which we spend our lives. Now, one of the greatest features of the nineteenth century has been the continual effort to prolong life, and you are, I am sure, doing much in this important movement by seeing that your clients live in sanitary surroundings, and thus avoid those terrible scourges of fever and other maladies which not so long ago used to decimate many communities. I need not here say how much the medical profession is doing in the interests of prolongation of life, or how, in fact, nearly every profession, and even nearly every trade, directly or indirectly, assists in adding to the longevity of the present and coming generations. Our public authorities, not forgetting the police, are much occupied in the same manner, for they try to protect our lives in numerous directions. And yet neither these authorities, nor architects, nor any profession, for the matter of that, has so far done very much for the safety of life from fire.

Now, it may be somewhat aside from the question of the Paris catastrophe, but it may interest you to hear that Great Britain alone has an approximate total loss of property by fire of seven million pounds per annum, and remember, this is an absolute loss of the nation's wealth, and the wealth of the communities concerned. The annual loss of life is very heavy, and the number injured exceedingly large. Now, quite apart from sentimental reasons, is it not very curious that in such a practical country as ours, we should allow this constant drain in life and property, and what is more, allow it to a far greater extent than is the case in several other countries which are by no means so business-like as we are, and are certainly not doing so much to prolong life as we do in this country? The object of reading this paper before you, and not, say, before some body of economists, some gathering of statisticians, or some association of public officials, is that to my mind, the architect and the surveyor often assisted by the civil engineer, can do far more in minimising our loss of life, and thus add to the longevity of our race, than any law or regulation can do for us. You know it is the old saying that "Laws are made to be broken," and I am sure many of you pride yourselves on your "cuteness" of having found some outlet, some makeshift or excuse, for avoiding some of the few requirements laid down by the public authorities in this matter of safety from fire. We all know how proud the architect is when, say, he has a factory case, with the lives of hundreds of employees involved, and he can go to his client and say: "Sir, I have saved you that emergency staircase which figured so prominently on your schedule," and mentally, perhaps, he thinks of the extra twenty-five guineas he will get for his successful negotiation. We know, gentlemen, how proud the theatre architect is, when fighting against some long list of requisitions, he can point out to the lessee: "I have saved you that exit; I have saved you that reduction of seats;" and maybe he also thinks of the extra fee, but certainly he never—any more than the architect with the factory case—gives a thought to the lives of those who enter the building on which he has advised. Don't let me be misunderstood; every

architect not only has the right but the duty to express his opinion on the requirements or requisition with which the public authority wishes his client to comply. We know full well that public authorities, with the very best of intentions, sometimes get ignorant officials, more especially in their junior ranks. We also all know the ambitious young official who prides himself on the long list of requisitions he has made at Mr. Tom Jones' theatre, and on having discovered the many faults of that playhouse all by himself. I am not trying to dissuade any architect from the fair, open-minded and technical criticism of any list of requisitions. But I consider it reprehensible, nay, wicked, to oppose every regulation for the safety of life and property for the mere sake of opposition, and for the mere sake of pleasing one's client. Study the requisitions conscientiously, and if you find exaggerated demands on the part of the authorities—mistakes, faddism—certainly try your best to get your client out of spending unnecessary money. If the authorities know you to treat matters seriously and fairly, you are sure to have far more consideration given to your arguments than if the reverse is the case. But again, don't oppose for the sake of mere opposition, or because it is the fashion to try to "best" the authorities. Now don't say that this opposition is at the instance of the client. The client very seldom wishes to

After the fearful loss of life in this building whilst used for bazaar purposes, and hence having its floor space in nowise blocked by seats or barriers, it would be well to remember that the premises had actually been previously used for theatrical purposes. The building had been equipped with a stage, with a raking floor, with fixed seats, and all paraphernalia and illuminants for dramatic performances, and such entertainments had actually been given on the premises. Both the stage and seats had only been removed to enable the structure to be adapted for the organisation of a charity bazaar.

Next it should be noted that the site of the building was in the Rue Jean Goujon, close to Rond Point of the Champs-Élysées on the one hand, and the Cours la Reine on the other, and hence it was situated in a much frequented part of the city. It was not hidden away in some back garden or placed in some outlying suburb. Roughly speaking, the ground has a frontage of over 90 metres, or nearly 300ft. Its depth averages 45 metres or 150ft. It is within a few hundred yards of a small police station in the Palais de l'Industrie, which also has a permanent fire watch from the "Régiment des Sapeurs Pompiers." An important station of the latter body is not far distant.

Speaking of the structure, nearly 80 metres of the frontage was taken up by the temporary building, the average depth of which was 13

AFTER THE FIRE. SKETCHED BY HARRY BUDDEN.

oppose the legitimate requirements of the authorities, or at least not until the architect has told him of all the savings he will try to effect by avoiding the regulations and requirements. Every factory owner knows what a fire would mean for his business, no matter how well insured he may be; every theatre owner and manager knows his responsibility well, and knows that the audience of to-day wishes to feel safe when taking their amusement. The opposition of 1897 to my mind mainly emanates from the architect. And I will go farther and say that it emanates not only from an inherent love for opposition to any so-called Building Act, but also from the architect's desire to show his client what he is worth. Now leave that kind of thing to the bad architect, who has no reputation to lose. Follow the lead of such men as your old friend Mr. Ernest Runtz, or say Mr. Darbyshire in the north, who, though both keenly asserting the rights of their clients, always try to give their places of entertainment good straightforward planning, in full accord with modern requirements. Give a hand yourself in stopping this fashion of opposition. Withhold your admiration from architects who are setting the bad example. Boycott such arch-miscreants as Mr. No-Acts, and Mr. L.C.C.-Hater, though they are old friends of ours, otherwise measures will have to be adopted to make architects personally responsible for their buildings, as is the case in other countries, and I am sure you would not like that.

After these preliminary remarks, let me give a few facts about the Paris Bazaar Fire, and the construction of the building which was the scene of the holocaust.

Firstly, it should be noticed that the scene of the catastrophe was in a temporary structure

metres, and there were several small additions to the back, namely a refreshment room, a large store room, used at the time of the catastrophe as a cloak room, and the fatal cinematographie room. The last named annexe, which will be seen from the ground plan, was not, as far as the plan shows, in direct communication with the main building for entry and exit, the approach being from outside and the visitors passing through door No. 3. The main building covered about a third of the superficial area of the site, while two-thirds having an average depth of 32 metres, had not been built on. The site was enclosed on the back and two sides by walls of various heights from 15ft. upwards, and by the party walls of some adjoining houses. One of these blocks, the Hotel du Palais, has windows overlooking the grounds.

The plan of the building shows a long gallery constructed of a series of framed trusses, the whole of the work being in timber. All the walls were matchlined on both sides. The roof was partly covered with tarred felt and partly with glass. The total cost of the structure was about 12,000 francs, or about £480, of which sum nearly half was spent on the materials employed. The contractor carried out the work with particular regard to economy, and hence, perhaps, the lightness of the materials employed. So far as the contractor was concerned, the building appears to have been considered of a private character; little or no supervision apparently being exercised by any of the local authorities. The principal entry was through two doors, placed centrally, No. 1 and No. 2, and the visitors passed through a small vestibule and inner lobby in each case. There were four additional exits at the back, Nos. 3, 4, 5, and 6, of which No. 3 alone seems to have been well known,

* A Paper read before the Architectural Association on October 22nd, 1897.

SITUATION OF SITE.

owing to its forming the approach to the cinematographe annexe already referred to. There was another exit, No. 7, used for service purposes, with which only the management and the stallholders were acquainted, and there was also a small door from the refreshment annexe, No. 8, into the open. In the front of the building there were several windows to the office, the ladies' room, &c.

On both sides of the gallery there were rows of stalls, and the construction of these, together with the section of the building, is shown in the diagram I have had specially prepared from the working drawings in the hands of the contractor. The frontages of these stalls were faced with scenery, whilst the top of the hall was closed in by a velum of canvas. Perhaps I should also mention that the decorations to the stalls were old, worn, and very dry. The floor was of wood, resting on timber sleepers. On the exteriors the only attempt at decoration had been in the central feature.

It will be seen from the drawings that the glass at the top of the building must have been broken almost immediately, through the enormous velum becoming a sheet of fire. Further, it is evident that the velum must have broken away from the points at which it was hung, falling on those beneath it. The tar on the roof also dropped in a molten or burning state. The plan will explain how those farthest away from the centre, on the cinematographe side of the building, must

have been cut off directly the flames took a hold of the doors No. 3 and No. 1. It was further natural that there should then be a general stampede towards entrance No. 2, and to that part of the hall farthest from the cinematographe. The extra doors, No. 5 and No. 6, were apparently so little known that they were not used, and it appears that many of the visitors were caught at the entrance to the store annexe, which I have already stated was then serving as a cloakroom, and hence well-known to many of the ladies, who, in the excitement of the moment, must have associated it with an exit.

It is not my purpose to discuss the plan in detail, but there is one thing certain, and that is, that at first sight the number of exits, eight in all, would appear sufficient for a substantially-built structure which has its floor on the ground level. I would even go so far as to say that there are not many galleries of the same dimensions, standing under the control of a public authority in this country, that have a larger number of exits; but here it should not be forgotten that in the planning of places of public entertainment precautions are not based on the assumption that flames will spread with such rapidity as was the case among the decorations, fittings, and general appliances of this fatal structure. In a well-planned theatre of the most modern type there is always the supposition that some four or five minutes' time will be given to the audience

to leave their seats in the auditorium proper. There is one unfortunate feature of the planning of the Paris Bazaar I cannot, however, help noticing, and that is the manner in which the lobby to entrances Nos. 1 and 2 were set out with the view of excluding draughts. I am unable to get reliable information if the wings to these doors swung outwards. As to the doors Nos. 3, 4, 5, 6, however, I know that they opened inwards, and that one of them was blocked or bolted at the time of the catastrophe.

Looking at the plan of the building, its construction and contents, and considering well all the defects that such a structure must contain, I would yet point out that the extent of this calamity was due in a great measure to the fact that the majority of those present were ladies whose clothes must have undoubtedly caught fire immediately the lengths of canvas velum and burning tar fell. I have on a former occasion argued that English women are far more fearless in facing danger than their sisters of other nations, owing to their constant association with the various forms of sport practised in this country, and much has unfortunately been said to the effect that a panic of such dimensions would be impossible in Great Britain. I scarcely, however, think that my argument holds good in a case like the recent catastrophe at Paris, for the scene must have immediately been of such a terrible nature that even those whose profession makes them acquainted with the terrors of fire would, in all probability, have lost their presence of mind. It would not be doing justice to our French neighbours if I were not to say that, in spite of the severity of the panic, heroic deeds were done and many deaths died in doing gallant acts, acts which Englishmen and women would have been proud to be associated with.

If I may be allowed to classify, the Paris Charity Bazaar was a semi-public entertainment, held in a provisional building. As you know, our entertainments are either of a private character, of a semi-public, or of a public character, whilst the buildings utilised are either permanent structures specially erected for a specific purpose, permanent structures temporarily adapted for some such purpose, or they are provisional buildings.

As far as public entertainments in buildings specially erected for the purpose are concerned, nearly every country has already inaugurated some policy for preventing catastrophes. I here speak of the theatre, the music hall, the assembly room, &c. Europe has, in fact, every kind of legislation conceivable for the protection of the public in this class of structure. There has been hysterical panic legislation, ponderous regulations in which every detail is defined by law, also codes which leave practically everything at the discretion of an executive of experts, and regulations which are merely so by name, and are a farce because they cannot be put into force. There is no uniformity in the preventative legislation of the world, even in its elementary principles. If we study the regulations of different countries consecutively, with an idea of discovering what is really necessary, the result is most confusing. Now, I am not going into detail. But I will say,

SITE PLAN.

broadly, that some countries seem to consider that good construction is the essence of safety, whilst clear planning, watching, and inspection are forgotten. Other countries give all attention to endless regular inspection, and omit the watching; others, again, require inspection only; whilst others, perhaps, insist on good planning, construction, and ample inspection, but disregard the watching. It is time for some representative body of experts to decide what they consider necessary in the interests of the public. I am not going to raise the many questions as to the proper executive for locally determining or enforcing the requirements, nor shall I enter into the merits of individual regulations. I will simply call your attention to the want of uniformity in the main, and elementary principles for obtaining safety where we have to deal with buildings erected for specific purposes and where specific forms of entertainment are given.

Personally, I hold that for a theatre or music hall, clear planning is of greater importance to the audience than clever forms of construction, or the employment of materials having considerable power of fire-resistance; and, further, I contend that in such buildings the regular attendance of fire-watchers day and night, and more especially during performances, is more essential than any amount of regular or even surprise inspection. But, remember, this is only a personal opinion. There are no definite conclusions as yet arrived at by any body of experts representing the conflicting interests which play such a prominent rôle where our public entertainments are concerned.

In expressing my opinion on the matter, I should, perhaps, say at once that I consider it the duty of the authorities to attend to the protection of life in the first place, and to the protection of property in the second. As we all know how easily a panic occurs without any fire, and how dangerous the rush of a frightened audience can be, the clear exit of ample dimensions and most direct route will be the greatest safeguard against loss of life, and perfect symmetry of plan of very great value. The prevention of a cause for panic is best guarded against by the constant presence of experienced and responsible firemen, who will on the one side recognise the possibilities of danger in time to prevent a fire, and on the other be able to act smartly in case of an outbreak. I do not wish to disparage good construction, or regular and surprise inspections; but I consider the most careful regulations as to construction and materials are of little practical value, so far as the safety of the audience is concerned, if at the same time the planning is not straightforward, and responsible firemen are not regularly in attendance. To take an extreme case, wood stairs will take the audience quite as quickly into the open as stone ones, and stone stairs with many winders and a complicated plan will be far more dangerous than wooden ones of straight flights of, say, fourteen steps each. Don't let me be misunderstood; of course, good construction and fire-resisting materials lessen the risk of an outbreak of fire, and I shall always advocate such construction and materials. But I have inspected many theatres built of slow combustion materials, and yet have found them

dangerous in the extreme through bad planning; and I wish to point out that a building erected entirely of fire-resisting materials is not necessarily the safest. It is also on account of my acquaintance with the fact that many important cities, though equipped with modern regulations for the erection of theatres, have no powers to enforce the presence of an official fire-watch during the performances, that I am anxious to lay stress on the necessity of watching, and not only inspecting, the theatre and music-hall of to-day.

All that I have said so far refers to the permanent building erected for a specific public entertainment, and even here, with given facts, I have to tender personal opinion, because we have not yet arrived at definite conclusions on the subject. What, may I ask, is the state of affairs as to semi-public and private entertainments in buildings, halls or rooms only temporarily utilised for gatherings of this description? Why, so far nothing whatever scarcely has been essayed, let alone decided. Legislation on the subject in this country is as non-existent as it is on the Continent. Why, we have not even as yet any practical definition as to what a private or a semi-private entertainment is. The whole subject is so delicate an one that even such despotic police administrations as those of Prussia and Russia have not yet felt their way. Where do the privileges of private entertainment cease? and when does an

entertainment assume a public character, not only as such, but more especially in respect to public safety? Cannot every man do exactly what he pleases on his own property, so far as entertainment is concerned, and as long as the general public is not admitted by payment? But is not a Foreign Office Reception on Her Majesty's Birthday in reality to all intents and purposes a public entertainment, and similarly, the ladies' political drawing-room meeting in Park Lane? Is not a bazaar, held in a tent, say, at the Botanical Gardens, and to which only members of the Society with their friends are admitted, a public entertainment? How many bazaars, let me ask, are held without payment for admission on private property, which are essentially of a public character? Think of the many meetings, so-called private theatricals, subscription balls, and other fêtes! How is classification to be attempted? How are we to define our entertainments? But here a suggestion, Is it necessary to classify at all? Is it essential to make limitations as to the different classes of our entertainments? I think not. Whilst most of our legislators at home and abroad are trying to define our entertainments and then to frame certain requirements for the safety of the public, why not let the character of the entertainment take care of itself. Let us look on every room over a given size as a place in which we may or may not congregate, with or without payment, to dance, to sing, to let others sing and dance, just as the case may be. Let the superficial area of any given room and its position alone govern our requirements for safety; not the fact that it is a private dwelling-house, a saloon at an inn, a schoolroom, or a Board room.

GREAT ART WORKERS OF THE CENTURIES.

GRINLING GIBBONS—ARTIST WOOD CARVER.

THE art of producing and the desire to possess representations of natural objects executed in relief or in the "round," as it is technically termed, appears to be innate in the human race; it is an even stronger faculty than that of linear design. To find an uninstructed child with a natural ability and taste for drawing is comparatively rare, but almost any child would be capable of modelling rude little figures in clay, and pleased to do so. Of course, from the very beginnings of rude glyptic Art, wood has been a favourite material for figure-carving. Stone suitable for sculpture is not to be found everywhere. It is, moreover, difficult to cut, and requires keen and peculiar tools for its manipulation. But any shepherd boy or country lad can attempt with his much cherished jack-knife to carve the root of the blackthorn stick, upturned from the hedge-row, with the head of a dog, a horse, or a man. Just in the same way did the primitive homo of four or five thousand years ago cover his war club or the paddle of his canoe with elegant ornamentation carved with a bit of flint, and just so does the Polynesian savage of to-day decorate his weapons and his tools. Many of the wood carvings of the primitive cave-dwellers have been dredged up from the bottom of the Constance and other Swiss lakes, and may be found in museums, together with plenty of specimens of savage Art of the present day, and the similarity of the style of ornament—often very tasteful and elaborate—is astonishing. Very little use was made of wood as a material for carving during the early historical period. Some few wooden images of very early Egyptian work are extant, it is true, but they partake more of the nature of dolls and lay figures than veritable wood sculptures. Nothing of the kind is found among the Assyrians. Amongst the Greeks, as we know, their greatest sculptor Pheidias appears to have employed wood for what may be termed the skeleton of his grand chryselephantine statue of the Olympian Zeus. That is to say, the figure was formed of gold and ivory upon a substructure of timber, but this was certainly not to be classified as wood carving. Ordinarily all Greek sculpture was of stone, as may also be predicated of

ROMAN STATUARY.

except when occasionally the latter nation resorted to metal foundings. But with the rise of Gothic Art wood became a very favourite material with the carver. It is perhaps fancifully conjectured that the beautiful Gothic arch was derived from the idea of the meeting and overarching arcades of tall forest trees, conceived by architects sprung from those Northern races who had ever been forest dwellers. Certain it is that the great Teutonic and Scandinavian races from which we English have sprung have always admired timber as a building material, as the magnificently wrought roofs, screens, and stalls of many an English, French and German cathedral and church can testify. It was part of the firm faith of the ancient Gothic builders, many of them pious clerics, that all materials were the gifts of the beneficent Creator, and could, by human skill and labour, be turned to the glory of God and the gratification and pleasure of his Church. Hence stone, wood, and iron were alike turned to enduring forms of beauty, by men who veritably appeared, both in a religious and an artistic sense, to be inspired. The Renaissance brought to the fore

A NEW SCHOOL IN ART.

Architecture, and decoration. It revived the old Classic, and hence Pagan Art, and was, therefore, far less distinctively religious than the Gothic school, but nevertheless it did good and useful work in its day and generation. Gibbons, the subject of this brief sketch, must be fairly considered as a disciple of this school. Grinling Gibbons was born in London about the middle of the seventeenth century, and was descended from a Dutch family which settled in England at that period. The ex-

quisite taste which he exhibited in his carved work attracted the attention of wealthy patrons of Art, and he was made a member of the Board of Works during the reigns of Charles II. and James II. He excelled in carving flowers and foliage, and he executed many subjects of this kind with so much delicacy that the effect was perfectly astonishing; so delicate was some of his work that the very leaves and tendrils quivered from the footsteps of persons passing along apartments in which these delicate carvings have been placed. In the library of St. Paul's Cathedral there is some good Grinling Gibbons work, and in Whitehall Gardens is a statue of King James habited as a Roman warrior, also by the subject of this sketch. Horace Walpole says: "There is no instance of a man before Gibbons who gave to wood the loose and airy lightness of flowers, and chained together the various productions of the elements with a free disorder natural to each species." "So delicate was his workmanship," says the same writer, "that Gibbons carved a pot of flowers which shook in the room from the motion of the coaches passing in the street." Later on in life, when Gibbons' fame rested on his productions as an architectural wood carver and not upon furniture decorative work, his style became much more elaborate and delicate. All his designs follow the style of the Italian Renaissance, and some of his carvings recalls the Brothers Adams in their architectural decorative work.

LIVERPOOL DOCK EXTENSION.

THE important scheme of dock extension at Liverpool, with which rumour has been busy for some days, was formally submitted at the last meeting of the Mersey Docks and Harbour Board. The Works Committee, with a view to providing increased accommodation for vessels of the largest class, and bearing in mind the tendency of vessels to increase in dimensions, recommended for approval a scheme of the engineer which will involve an estimated expenditure of £316,000. It also recommends that borrowing powers be sought for defraying the cost of these projected works, in addition to £817,000 for works authorised by the Act of 1891, and £300,000 for the construction of the new tobacco warehouses at the Stanley dock. The total sum required will be £4,433,000. At the south end it is proposed to construct four branch docks; two on the west side of the Queen's and two on the west side of the Wapping docks, flanked with double-story sheds, and to deepen and widen those docks and the connecting passages. There is to be a 630ft. graving dock on the site of the present Queen's half-tide dock, and a 620ft. graving dock on the site of present Brunswick graving dock. The Coburg, Brunswick, and Union docks are to be deepened and otherwise brought up to present requirements. The improvements at the north end include the construction of a branch dock on part of the site of the Sandon graving docks, flanked with double-story sheds. There is to be a graving dock, 1000ft. long and 90ft. wide, near the Huskisson dock. Part of the Sandon dock is to be converted into a deep branch dock, and the Huskisson branch docks Nos. 1 and 2 are to be improved and deepened.—Mr. J. W. Hughes, chairman of the Works Committee, in moving that the recommendations here epitomized be deferred till next week in accordance with standing orders, said that some members considered they were not going far enough, while others thought they were going too far. In his opinion they had hit upon the happy mean. The outcome of the scheme was that provision would be made for a very large number of vessels of 800ft. long, for a number of vessels over 900ft. long, and, roughly, about 250,000 square yards of shed floor. It also provided three excellent new graving docks, and a new entrance was made into the southern system.—Mr. Hughes pointed out that the south-end docks to be modernised were within a mile of Liverpool Exchange.—The motion was adopted.—The south-end docks, which are to be brought up to date, were constructed from 80 to 100 years ago,

Professional Items.

DUMFRIES.—A stately church which has been erected within the grounds of the Crich-ton Royal Institution, was opened recently. The church has been eight years in building. The design is by Mr. Sydney Mitchell, Edinburgh. It is a noble example of Gothic Architecture, and is one of the finest modern ecclesiastical buildings to be found in Scotland. The design is cruciform. The building stands almost due east and west, and extends to a total length of fully 200ft. The west doorway is deeply recessed and richly carved, and the door is of hand-wrought iron work. A porch encloses the entrance stair, which leads to a height of 11ft., that being the level of the church floor; and within the porch are two rows of columns, with carved capitals, from which spring numerous moulded ribs intersecting in all directions, and forming a series of pointed arched vaults of various heights and widths. The church is entered from the stair landing, through another doorway with richly-sculptured foliage ornament. The nave is divided from the aisles by rows of columns, from which spring pointed stone arches, and these carry the masonry of the clerestory. The choir is 28ft. square, the openings terminating in pointed arches rising to a height of 50ft., and here are four massive piers forming the sub-structure of the square centre tower, which rises to a height of 123ft. The ceiling is of oak, formed into a series of panels decorated throughout with high relief carving, and has a deep carved running foliage cornice. The ceiling height from the floor to the crown of the roof circle is almost 60ft. in the nave and 65ft. in the choir. The floor is constructed of white paranazzo, inlaid with Irish red, green, and black marbles, in a bold and effective design. The communion table occupies the eastern extremity of the chancel, in which also are stalls for the choir. These and the pulpit and the screen of the organ chamber are of carved oak. At the eastern end of the church is a crypt or mortuary chapel, which, also, is a very fine piece of Architecture. The elegance of proportion and beauty of detail are striking characteristics of the whole building.

DURHAM.—An interesting ceremony took place at the Castle, Castle Eden, when Mr. W. R. Simpson, who had acted as clerk of the works on the restoration of the Castle, under Messrs. Hicks and Charlewood, architects, Newcastle-on-Tyne, received from Mr. Rowland Burdon, the owner, a beautiful silver casket as a mark of appreciation of his ability and integrity.

FLOCKBURGH.—The new Parish Church of Flockburgh, which is being erected in the Early English style, will, when completed, consist of a nave 62ft. long by 22ft. 10in. wide, at the western end of which will be a massive tower 26ft. 6in. by 25ft. externally, and 53ft. high to the top of the parapet. On the north and south sides will be arcades of four arches—three in the nave and one in the chancel, which is also divided from the nave by an arch 26ft. high. The north aisle roof will be continuous the whole length of the arcade, but on the south will be interrupted by the organ transept, whose gable will project slightly beyond the line of the aisle. The height to apex of nave roof will be 39ft., the chancel being about 18ft. lower. At the eastern end of the chancel will be an apse with stone groined roof, lit by three lancet windows. Advantage has been taken of the sloping nature of the site to form the vestry under the apse at the east, and equal to 20ft. by 17ft. in area. The heating apparatus is also contrived under the organ chamber. Access is obtained to these places from the outside by a door in the east wall, entered on the level, and from the church by a stone staircase east of the organ. The church itself is entered by north and south doors and in the tower at the west end. The nave will have a clear story of six lancet windows each side, and the chancel two quatrefoil, and one long lancet window. The west

window will be a double lancet. The church is built with walling of local stone, obtained from Mr. Cavendish's quarries at the bottom end of Holker Park, and with dressings of Prudham stone in broken course worked inside and outside, except in interior of the apse, which will be faced with ashlar. The roofs of tower, chancel, and nave and organ transept will be covered with stone slates, and the aisles and apse with lead. The roofs and nave seats will be of pitchpine, and the floors under nave and aisle seats will be laid with oak blocks, the choir stalls being also of oak. The aisles and passages will be flagged and the chancel floor lain with encaustic tiles. The work is being carried on by the following contractors:—Masonry, Mr. Anthony Blair, of Allithwaite; carpentry, Messrs. Gradwell and Co., of Barrow; slating, Mr. Chippendale, of Grange; plumbing and glazing, Mr. A. Moorhouse, of Kirkby Lonsdale. Messrs. Austin and Paley, of Lancaster, are the architects.

GLASGOW.—The police and fire station at Strathbungo was last week inspected by over sixty high-school students, who were conducted over the building by Mr. Sharpe. The fire station enters off Addison Street, and, in addition to the latest requirements, contains a prominent tower, 50ft. high, with a stove at the foot for drying hose. A complete lighting department, with a muster hall for fifty men, enters off Prince Edward Street. The police department enters off Craigie Street. Cells are provided for fifty prisoners. The police-court is well-planned, having separate entrances for magistrates and counsel, witnesses, prisoners, and the public. The cost of the buildings is £17,000. Mr. A. B. McDonald, Kelvinbridge, Glasgow, is the architect.

HORHAM.—Horham Hall, the place which Mr. Allen Upward, with a literary friend, has just secured as a country residence, is one of the few historical mansions of England which are still inhabited. Originally built at the end of the War of the Roses, on the site of an older castle, it was added to afterwards in order to serve as a residence for the Princess Elizabeth. The tower was built at the same time; it contains windows commanding all points of the compass, and at the summit there is a secret peephole, overlooking the London Road. Out of the kitchens of Horham ran an underground passage, now much choked up, for five miles.

ILKLEY.—The sub-committee appointed by the Ilkley District Council to select a site for the erection of town's offices has unanimously decided to recommend the adoption of a larger scheme—viz., the utilisation of what is known as the Sedburgh Estate, not only for public offices, but for a large hall capable of accommodating from 1300 to 1500 people. At the same time accommodation would be afforded for a free library and for the museum. The land, costing over £6000, has already been acquired. The proposal also provides for the erection of several lock-up shops in the front of the building, which, roughly speaking, is estimated to cost £10,000, exclusive of furniture.

MILLWALL, E.—The dedication stone of the church of St. Cuthbert's, Millwall, to which will be added a club and schoolrooms, was laid a few days ago. The church of St. Cuthbert, which was formed during the present year, is within the parish of Christ Church, Poplar. The site for the new buildings has been given by Lady Charteris, while about £3000 in all has been derived from other sources.

RISLEY.—During the past fifteen months a series of improvements have been effected in the parish church at Risley. The church itself was originally built, probably as a private chapel for the Hall, in 1593, and was consecrated forty years later. It then consisted of a small nave, with a chancel separated by an oak screen, apparently older than the building itself, and with a gallery at the west end. In 1845 the building was enlarged by the addition of a north aisle, equal in size to the nave, and the gallery was removed, and the whole fitted

with high pews of painted deal. The first of the recent alterations was the erection of a spacious vestry. Then the chancel was entirely refitted, and the old seats, which were much dilapidated, were replaced by beautifully carved oak benches. A carved oak altar took the place of the old deal one, and this has been completely fitted with brass furniture and oak altar rails. The old oak framework of the screen has been divested of its coats of paint and left intact, but the more modern panels of painted deal, which blocked any view of the interior have been removed and replaced by very light tracery of oak. Elaborately carved cresting has been placed on the top, surmounted by a plain oak cross. Next an organ chamber was built at the west end of the north aisle. The next renovation consisted in the whole of the roof being panelled internally with varnished pine, and the chancel walls and roof decorated by Messrs. Powell, of Lincoln. The walls of the church were thoroughly cleaned, and the church fitted throughout with electric light, supplied from the station at Risley Hall, while in the churchyard all the walks were paved and kerbed with Hopton Wood stone. A new pulpit of carved oak has been added, as well as a costly brass eagle lectern from the works of Messrs. Hardman and Powell. Externally the walls and roof have been thoroughly repaired, and efficient drainage has been provided. The whole cost of the work is less than £2000. The architects, under whose supervision the work has been carried out, were Messrs. Evans and Son, and the contractors, Messrs. Hodson and Son, while the pulpit and more elaborate carving has been executed by Mr. W. I. Beckett, all of Nottingham.

ST. BLAZEY.—The parish church has just been re-opened after restoration. The church, a very ancient and comparatively small granite structure, having fallen greatly into decay, its supporters embarked upon an extensive scheme of restoration, which has just been completed. In certain respects the appearance of the interior has been brought into line with modern ideas, particularly by the removal of the high pews. The estimated expenditure is about £900. Mr. E. Sedding, of Plymouth, was the architect; Messrs. Hobbs and Bartlett, of Callington, have carried out the work.

THORNTON.—During the present year the organ builder has been much in evidence at Thornton, no fewer than three places of worship having been supplied with new instruments. In the early part of the year the Brontë Memorial Organ was fixed in St. James's Parish Church, on Saturday last the opening ceremony in connection with a new organ at Egypt United Methodist Free Church took place, and at Kipping Independent Chapel a new organ is just on the point of completion, and will be opened shortly.

A GREAT deal of very strong feeling has been aroused in Manchester by the proposal of the Art Gallery Committee to abandon the annual autumn exhibitions there in favour of occasional shows, arranged simply as adjuncts to the permanent collection. Local Art opinion seems entirely opposed to this suggested change of policy; and certainly there is little to be said in defence of a scheme which will put the city entirely out of touch with modern Art developments, and make it of no account among the great provincial Art centres. A fine, permanent collection has, it is true, been brought together by the Corporation; but the judgment with which purchases have been made in the past is, beyond doubt, a result of the stimulus provided by yearly exhibitions of the best modern work. What will be the future of the municipal gallery it will be hard to say, if these reminders of outside progress are dispensed with, and the responsibility of adding to the city Art treasures is laid upon the men who have neither the courage to support Mr. Walter Crane in his reform of the Art School nor the common sense to recognise the part that is played in industrial life by the Art of the moment.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

POLISHING PITCH-PINE FLOORS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—If any one has had any experience in polishing pitch-pine floors, I shall be very glad of their advice in treating a 3in. secret-nailed pitch-pine floor, scraped surface,—with the method of preparing and executing polishing, and the component parts of same.—Yours truly,

POLISHER.

As the floor is scraped, next paper it with $1\frac{1}{2}$ glass paper, with the grain finishing circular. Then clean off with turps, and rub in filling composed of finest plaster-of-paris, yellow ochre to tint, mixed with warm water and a little linseed oil (raw). Clean off the filling, let dry, re-paper, and then apply ordinary yellow French polish in portions about 6ft. square. A good wax polish is made thus:—Yellow wax, 20 parts; yellow ozocerite, 20 parts; linseed oil (boiled), 1 part; turpentine, 25 parts; raw sienna, 5 parts. Mix the two waxes over a slow fire, add the colouring previously mixed with the oil, when cold add the turpentine, this will make it the consistency of cream, apply with flannel rubber and polish with felt.

PUBLIC APPOINTMENTS.

MR. S. S. PLATT, Borough Surveyor, Rochdale, writes:—Permit me to supplement the reply given to "Doric" by the information that the Incorporated Association of Municipal Engineers hold examinations for candidates for certificates of competency in municipal engineering, &c., generally twice a year. Full information can be obtained from the secretary, Mr. T. Cole, 11, Victoria Street, Westminster, S.W.

THE WINTER SESSION.

MODELLING IN RELATION TO SCULPTURE.

THE usual monthly meeting of the Glasgow Architectural Association was held on Tuesday week. The lecturer began by characterising modelling as the beginning of all things, for by it the ideas were gradually developed in a tangible form changeable at will. The model in clay or other plastic material was a necessity for anything of importance to be executed in relief, representing work as it would appear when finished, and had been employed for such different subjects as statuary, silversmiths' work, and even a cake of chocolate. The essayist then touched on the many points of connection between the model and the replica in the different materials, finishing up with a selection of lantern views of models and the work executed therefrom.

HALF TIMBER WORK.

The eleventh meeting of the session of the Edinburgh Architectural Society was held on the 20th inst. Mr. W. A. Mellon read a paper entitled "Half Timber Work." Mr. Mellon gave a historical description of characteristic examples of the style, both Gothic and Renaissance, and then gave a short comparison between British and Continental work, and concluded by stating how far, in his opinion, half timber work was applicable to present-day building in Scotland. Mr. Mellon's paper, with the illustrations, will shortly be published in the BUILDERS' JOURNAL.

Trade and Craft.

A NEW PAVING IN LONDON.

Some interesting experiments with a novel species of paving material are being made in London just now, which might be watched with advantage by our Highways Committee. The paving material is a particular kind of bitumen, mixed with hard stone broken into small pieces. The mixture is pressed by powerful machinery into blocks the size of the ordinary wood blocks used for paving. These are simply laid down close together, and the weight of the traffic soon closes up the interstices between the blocks, and welds the whole pavement into a solid mass. Several advantages are claimed for this kind of paving. It is said that the blocks are absolutely non-absorbent, and thus the unpleasant smell which sometimes arises from wood paving is conspicuous by its absence. It is also said that this new paving never wears slippery as granite does. The bitumen in the blocks wears a little faster than the stone; and thus there is always a slightly roughened surface to afford a secure foothold for horses. The price is about the same as laying a street with Jarrah wood, and the new paving is said to last much longer, and to be quite as noiseless. If the London trials of this material prove successful, it might be worth while to experiment in Sheffield. There are streets where it is admitted that wood is out of the question; and something ought to be done, if possible, to save the inhabitants of these streets from such an infliction as ear-splitting granite.

IMPORTANT DECISION AFFECTING CARMEN, BUILDERS, AND BUILDERS' MERCHANTS.

At the City of London Court, on the 13th inst., Messrs. John Smither and Son, Ltd., carmen, of 6, Russia Court, Milk Street, brought an action against Messrs. Henry Conolly and Co., builders' merchants, of 42, Hampstead Road, to recover the sum of 10s. for detention of van.—The plaintiffs' representative contended that delivery of the goods was complete when the van arrived at the defendants' door, and that the contract there terminated with the consignors, and a new contract entered into with the consignees by the fact of the van waiting to be unloaded, and that the claim was based on the detention of the van from 8.30 to 4 p.m. on June 16, 1897, when, according to the plaintiffs' version, three-and-a-half hours was a reasonable time to allow for unloading.—The defendants' representative (Mr. Rainford) declined to admit that the time of detention was as stated by the plaintiffs, and if there was any detention it arose from circumstances over which they had no control, and denied their liability. He contended that there was no contract existing between the plaintiffs and defendants. The goods were brought by the defendants from a firm in Scotland, and were delivered partly by rail, sea, and road, the senders paying all charges, therefore the carriers became the servants of the consignors, and were not the servants of the consignees, consequently no contract existed between the plaintiffs and defendants, and that the plaintiffs must be non-suited.—His Honour gave judgment for the defendants, with costs against the plaintiffs, on the ground of no contract, and that the carriers were bound to unload their own van at the defendants' warehouse door. It was not the duty of the consignees to unload the plaintiffs' van.

ALLEGED BUILDING IRREGULARITIES.

At the West London Police Court probably the largest number of summonses ever taken out against one man were heard by Mr. Rose at the instance of the London County Council, who issued 104 for irregularities under the Building Act. The builder was Joseph Wilson, who had erected nine houses in Steppendale Road and twelve houses in Trunmead Road, on the Wandsworth Bridge Road estate.—The evidence went to show that soft bricks had been used in the internal walls instead of good sound hard bricks, the mortar and bonding not being in accordance with the bye-laws, and

dirt instead of grit mixed with the lime.—Mr. Glen read a letter addressed by the district surveyor to the County Council, expressing an opinion that "placed bricks" were preferable to hard stocks in houses of two stories, because the latter had more resonant qualities.—After hearing one expert witness, Mr. Rose adjourned the summonses.

THE COCKLAW QUARRY CO.

The Cocklaw Quarry Co. intimates that it has obtained a lease of the Blackpasture Quarry, near Chollerford Station, Northumberland, on the North British Railway, and, to facilitate transit, formed a connection from the Quarry to the main line. The stone is a cream-coloured sandstone, fine grained, and of notable weathering qualities. Dr. J. Collingwood Bruce, in his "Handbook to the Roman Wall," refers to the Quarry as follows:—"The stone is a close-grained sandstone, and may be obtained in blocks of any size. The storms of centuries have little or no effect upon it. . . . Next we come to the most remarkable feature on the whole line of the wall, the remains of the bridge over the North Tyne. . . . The stone is from the Blackpasture Quarry, already referred to. . . . The peculiar feathered tooling of the facing stones will be noticed. . . . There have been three water piers. It has been ascertained, by partial excavation, that one of them lies immediately under the eastern bank of the river. Two others are, when the water is low and placid, to be seen in the bed of the stream. Blocks of masonry, which have resisted the roll of this impetuous river for more than seventeen centuries, are a sight worth seeing, even at the expense of being immersed in cold water to the full extent of the lower extremities. That end of the piers which is directed towards the stream is pointed. The *luis* holes remain in the stones. The grooves formed for the iron rods and cramps can also be discerned."

WHAT IS A FLUE?

For a considerable time at a recent sitting the Judge, Mr. Lumley Smith, Q.C., in the Westminster County Court, discussed the question, "What is a flue?" An agreement was entered into between the owner of an old house at Woolwich with a neighbour whereby the latter was to carry up the flue. This had been done by zinc "tallboys," and it was alleged by the plaintiff that she (Mrs. Moulton) was entitled to brick chimneys, as the original ones were brick.—His Honour asked the first surveyor: Is flue a technical or a popular word?—The Surveyor: I should say a popular one, but a flue is of brick.—The second surveyor agreed that a flue was of brick.—His Honour desired some authority for it.—Mr. Arnold White, the defendant's counsel, said the dictionary put it as a channel for smoke.—The Witness: The Building Act says it must be 4in. brickwork.—His Honour: So the Legislature has taken flue in hand. It's a sweeps' word, isn't it?—For the defence it was argued that the word chimneys, and not flues, would imply brick.—His Honour gave judgment for the plaintiff for £26 5s., as damages for breach of contract.

"THROUGH CHINA WITH A CAMERA" is the title of Mr. John Thomson's book which Messrs. Constable are presently to publish. It is to contain a hundred large size illustrations, forming perhaps the finest series of pictures of Chinese life and scenery ever brought into this country.

NOTICE TO PROVINCIAL READERS.

The Editor of the "Builders' Journal" will at all times be pleased to receive and consider articles of a professional or technical character suitable for these pages. Papers read before Architectural bodies will also, if forwarded, receive careful consideration.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN—For supplying and erecting a monument at Duthie Park, for the Town Council. Mr. J. Rust, City architect, Aberdeen.—
James Wright & Sons 2789 0 James Macintosh 2489 0
Wm. Gorstin & Sons 700 0 Archibald A. Brown 425 0
Alex. Macdonald and Co., Ltd. 589 10 Arthur Taylor, Aberdeen *Accepted 415 0

AYLESBURY—For the erection of three shops and residences in Cambridge-street, for Mr. H. J. Goodey Messrs. W. F. Taylor and Son, architects, Aylesbury. Quantities by architects:—
G. H. Gibson 21,550 Webster and Cannon. 21,438
J. Holland 1,480 Aylesbury *Accepted.
Mayne and Son 1,475

BILLERICAY—For the construction of stoneware and iron pipe sewers, with manholes, &c., for the Rural District Council. Messrs. Jones, engineers to Council, 25, Parliament-street, Westminster, S.W.—
W. H. Saunders and Co., Southampton 24,899

BOLTON—For the erection of a new Inland Revenue office, for the Commissioners of H.M. Office of Works. Quantities by Mr. Allan Paul, 6, Quality-court, Chancery-lane:—
E. and W. Maginnis 24,123 R. Paiton 23,489

Scott £1,110 | Rayner £985
Oliver 1,023 | Coulsell Bros. (accepted) 843

LONDON.—For alterations to the "Sun" public-house,
Curzon-street, W. Mr. T. W. Moss, architect:—
Drew and Cadman £985 | Wm. Irwin* £697
Ham and Son 740 | *Accepted.

LONDON.—For alterations and fittings at the "Canteen
Tavern" public-house, Vicarage-lane, Stratford, E., for Mr.
A. Foden. Mr. Fred. A. Ashton, architect, 177, Romford-
road, Stratford, E.:—
W. Watson £923 | C. North £830
G. and H. Cocks 873 | A. E. Sykes (accepted) 790
W. G. Maddison 870

LONDON.—For the erection of new hotel, Leicester-
square, W.C., for Mr. Richard Baker. Mr. Walter Emden,
architect, 105 and 106, Strand, W.C. Quantities by Mr.
Geo. Hackford, 2, Queen Anne's-gate, Westminster:—
F. T. Chinchon £43,123 | Patman and Fother-
Hall, Bedford, and Co. 42,943 | ingtonham £42,263
T. L. Green 42,780 | Holliday and Green-
Bywater 42,750 | wood 89,907
Beer and Gash 42,495 | A. J. Bateman 39,777
H. Roffey 39,750

LONDON.—For new sewers, Haggerston District, Acton
Ward, for the Shoreditch Vestry. Mr. J. Rush Dixon,
surveyor and engineer, Town Hall, Old-street, E.C.
Quantities by surveyor:—
Wilkinson Bros. £15,610 0 0 | John Jackson £11,910 0 0
J. D. Nowell and 14,457 3 2 | Killingback and
and Sons 14,457 3 2 | Co., Camden 10,959 0 0
Pedrette and Co. 14,272 19 0 | Town* 10,959 0 0
W. Neave & Son 12,834 0 0 | Clift Ford (with-
T. Adams 12,415 11 9 | drawn) 10,629 0 0
F. A. Jackson 11,918 2 6 | E. Parry 10,290 14 5
and Son 11,918 2 6 | *Accepted.

OPENSHAW (Lancs).—For the erection of school
buildings, St. Clements, for 606 scholars, for the Trustees.
Mr. Percy D. Lodge, architect, 5, Cross-street, Manchester:
H. Fielding £3,490 | S. Robinson £2,245
J. Lawton 3,239 | Hill and Hayes, Man-
R. Whitell 2,990 | chester (accepted) 2,845
A. R. Bullivant & Sons 2,930 | W. Hurst 2,840
[Architect's estimate, £2,820.]

ST. ANDREW'S.—Accepted for widening and recon-
structing Vishwell-road, St. Andrews, for the Landaff and
Dinas Powis Rural District Council. Mr. J. Holden, sur-
veyor, Council Offices, Queen's-chamber, Cardiff:—
James Wood, Whitechurch, Glam. £134 7 4

SHEFFIELD.—For the erection of stores, stabling, etc.,
at the corner of Abbeydale-road and Arnsdale-road, for the
Ecclesall Industrial and Provident Society, Limited.

Messrs. Hall and Fenton, architects, 10, Paradise-square,
Sheffield. Quantities by the architects:—
H. Vickers £3,328 0 | T. Margerrison, jun.,
M. Grantham 3,100 0 | Church-street,
Mastin and Son 2,789 0 | Dronfield* £2,558 0
Thos. Roper 2,647 0 | *Accepted.

SOUTHAMPTON.—For the erection of a new boiler-
house and chimney shaft at the South Stoneham Union
Workhouse, Westend, for the guardians. Messrs. Mitchell,
Son, and Gutteridge, architects, 9, Portland-street, South-
ampton:—
H. Stevens and Co. £305 0 | Houghton and Small £545 10
Jenkins and Sons 587 0 | J. Nichols, South-
Hood and Rebbetts 573 11 | ampton (accepted) 490 0

STRATFORD-ON-AVON.—For the erection of new stores
in Sheep-street, for the Stratford-on-Avon Co-operative
Industrial and Provident Society Limited. Mr. C. G. Huins,
architect, Redditch. Quantities by Mr. Herbert R. Lloyd,
Birmingham:—
John Harris £1,530 0 | Callaway Bros. £1,295 0
John Roberts 1,350 0 | E. J. Kennard 989 0
Smallwood and Co. 1,330 0 | Stratford-on-Avon* 1,217 18
*Accepted.

TAUNTON.—For new laundry at Messrs. Moody's Collar
Works, Taunton. Mr. T. W. Roberts, architect, Hammet-
street, Taunton. Quantities by architect:—
S. Manning £978 0 | A. J. Spiller £971 12
F. W. Rowsell 975 0 | W. Potter 989 0
H. J. Spiller* 974 0 | *Accepted.

TONYREFAIL.—For the re-erection, additions, altera-
tions, &c., shop and house, &c. Mr. J. J. Evans, architect,
Penarth:—
M. R. Rowlands £672 0 | Lemuel Evans, £50 0
Griffiths Bros. 650 10 | Tonyrefail* 650 0
Enoch Bros. 610 0 | *Accepted.

WALTHAMSTOW (Essex).—For the erection of a new
technical workshop at the Sir George Monson School for
Boys, High-street, Walthamstow, for the Charity Trustees.
Mr. W. A. Longmore, architect and surveyor, Bridge-
chambers, Walthamstow:—
R. and E. Evans £239 0 | Reed £470 0
George Barker 505 18 | Fuller 458 0
J. English 490 0 | Barton, Waltham-
Lawrence 477 0 | stow* 415 0
*Accepted.

WEST HAM.—For rebuilding the "Steamship" public-
house, Howard's-road, Stratford, E., for Mr. G. Lee. Mr.
W. M. Bruton, architect, Trafalgar House, Green-street,
Trafalgar-square, W.C.:—

Structural.
Burman and Son £3,111 | Godson and Son £2,598
H. L. Holloway 3,086 | Pritchard & Ronwick 2,538
R. E. Clarke 3,085 | Dearing and Son 2,825
W. Smith 3,021 | Courtney and Fairbairn* 2,733
Whitehead and Co. 2,899 | *Accepted.

Fittings.
Courtney and Fairbairn (accepted) £215.

Painting.
Buckley and Beach £103 | J. Warne and Co.* £299
*Accepted.

Gazefitting.
W. Winn £193 | 6 10 | Buckley and Beach* £188 10
*Accepted.

Modern Art.

So great is the wealth of ideas that are associated with sacred and secular buildings, that it is difficult indeed for the student and lover of Architecture to limit or define his appreciations. Our notions of fixity, shelter, comfort, and light, each help in a way to round and complete our conception of the various buildings we need—be they cottages, mansions, hostels, or churches. The first we

buildings enough it is true, but the drawing is seldom even tolerably careful, and the figures in the same paintings are bad as a rule. We are thinking perhaps more particularly of terrace views, of which we retain a general impression that they courted comparison with Tadema. The President's principal painting represents the interior of St. Peter's at Rome in the evening, and St. Peter's at that time of day, whether seen from within or without, is surely a glorious sight. The artist's peculiar effects of shivering golden light are familiar to all frequenters of galleries. There is as much distinction of line in this particular painting as the medium, oil, will permit, and for the rest, we can faithfully say that he has succeeded in making his representation impressive, and that he has diverted our thoughts, at least for a while, from things that are merely mundane. A companion picture to this would be an equally splendid exterior view, such as may be obtained from the Pineau gardens at sunset, and we must imagine that we have such a picture before us, as the spirit now moves us to speak in praise of the dome. They who speak slightly of it have the beautiful spire in view, but in our

citizens that it might be placed in the new Church of St. Paul's which they have set up in Rome. In width it is 30ft.; its height, perhaps, two-thirds of that. The execution of the work in mosaic has been successfully carried out, we are told, by Italians skilled in the craft, and this being so, the total effect should be splendid. There are not wanting signs that the tendency of modern thought is to prefer the more primitive forms of belief, and it will be agreed, we think, that there is an element of novelty in this design. We notice with pleasure that Christ, the victim of Hate, stands now for the Giver of Life. He no longer is nailed to the Cross as before, but is supported somehow by Igdrasil, the Tree of Life. In place of the two who died with him are Adam and Eve, right and left. The wheat-sheaf betokens labour—the fitting reward thereof; the lily, the virgin's flower—that children to her shall be born. The design altogether will appear to be healthful and beautiful. The genius of modern ecclesiastical Art has evolved a peculiar, a sexual figure of man of which it must be confessed we grow weary at times. For purely decorative purposes Fra Angelico's creatures, mere shells of the

PARIS BAZAAR FIRE. TURNSTILE NEAR SPOT WHERE THE FIRE ORIGINATED.

observe to our sorrow excludes the brave ships on the sea; but Nature provides us here with a sufficiently broad distinction, and in the contemplation of buildings attached to the soil, there is food for the busiest mind. Of the present Exhibition of the Society of British Artists we may have a few words to say, but it is considered advisable here for the writer to address his remarks to the lovers of buildings especially. It was said by the great Dr. Johnson that however fair was the prospect, it became fairer by far when a comfortable inn was in view; and his remark, we suppose, has been often repeated. The idea of a homeless life is perhaps the most depressing there is, and it would be impossible for us, by mere process of thinking, to discover the roots of our love for our buildings. If these generalisations are pardoned, it will be because the reader agrees that there are comparatively few pictures here to detain him. There are

opinion there is need of them both. In the dome is the brooding spirit of the solicitous mother of all. When the breast no longer is needed, she then sets us up on our feet, and we straight away begin building our little toy churches with spires! From whom but from her have we learned to look upwards and pray? The dome and the spire we speak of—each shelters a set of ideas, but it happens that both sets are sacred, and we say that the world would be poorer were it to be robbed of either. The dome may be proud of the spire—Hope's tribute to God—as the mother is proud of the best that her child has done. As the work of our hands must be ever imperfect, there may well be one nobler even than this bye-and-bye between us and the blue, blue sky. Of decorative designs the most important, of course, is the representation of Christ on the Cross, by Sir Edward Burne-Jones. It may not be generally known that the order for this design was given by American

soul as they are, are much to be preferred on the whole. The danger on the other side is of another more fleshly school. For the reason that architectural subjects present so many abrupt lines to the eye, we find in a general way that the pen is more usually employed than the brush by the artists who prefer these subjects to others. Already famous in our generation are Pennell, Railton, Hedley Fitton, and others—Walter New amongst younger men—but not one of them, we believe, is known as an oil painter. For architectural drawings and studies there are rooms in Burlington House, and things of this kind may be supposed to find their way there. It is idle to multiply reasons, and it may as well be said shortly that there are very few here which claim consideration as pictures of buildings. The paintings of Mr. Trevor Haddon must be excepted, however, as his records of study and travel are very delightful. E. R.

The Great London Estates.

It creates a bitterness in the heart when one sees large districts of a city like London handed over to the tender mercies of those who are absolutely ignorant of the arts that add beauty and dignity to our surroundings. It is grievous enough to see opportunity after opportunity for easily-made improvements carelessly thrown away, but when, in addition to this, the quiet dignity of old-fashioned streets is destroyed by the interpolation of some obtrusively vulgar erection, the fact comes forcibly home that some competent censor should exercise control over bodies that lack the judgment themselves. Unfortunately, the inertia of the general public in matters architectural renders remote the likelihood of such a course being taken; indeed, public bodies, though, of course, labouring under some disadvantages, fail to indicate that, on the whole, they would do any better than private owners—some of whom certainly take great pains to remodel their property on systematic lines. As a fair example of an estate on which an attempt has been made to work out a coherent scheme, we may refer to the Duke of Westminster's portion of Mayfair. Without suggesting that the buildings erected thereon are necessarily models for admiration, they seem more or less consistent in general character, and the method adopted of clearing and rebuilding whole blocks is preferable to the jumbling together of new and old, regardless of architectural effect. Other estates, that are under a more conservative régime, have the negative virtue of leaving things much as they were; till lately, the large Bloomsbury estate of the Duke of Bedford might have been placed in this category, but the management have now embarked on a more adventurous policy without possessing the capacity to carry it out; there is parsimony where there should be liberality, and extravagance where economy should rule. While the Duke of Westminster exercises discrimination as regards the architects employed, accidental or financial reasons are more potent in the case of the Bedford Estate, and, as a result, the quiet repose of Russell Square will soon be a thing of the past, and the existing houses, which are, at all events, simple and unoffending, will be tortured into all sorts of absurdities by means of terra-cotta dressings and the like. Bloomsbury Square has already suffered, though not in quite the same way, and the other squares and streets are doubtless only awaiting their turn. The other large properties might be placed somewhere between the two we have quoted, as regards the public spirit and ability possessed by their managers; but a defect inherent in the system by which a great town is portioned off in this way, shows itself in the debateable ground that lies between nearly all of them. They each seem to have regarded the adjacent district as one to be shut out at all costs, and though each may be covered with a good class of property, on the border line will be found small alleys, cul-de-sacs, &c., to which drift all the least desirable elements in the neighbourhood, where they remain to the detriment of the better classes on either side. True, "the poor we have always with us," but the poor, with decent dwellings in clean streets, is a very different body from the poor huddled into tumble-down houses up filth bestrewn alleys. It is, however, unlikely that anything short of a comprehensive scheme taken up by the authorities will abolish defects such as these, and from the architect's point there is but little even to be hoped for from them. While Shaftesbury Avenue remains as a monument to municipal taste, it will be difficult to put much faith in ameliorating influences from this quarter.

H. V. L.

Some Strange Terms used in the Building Trade.

As the building industry is one of the largest, and also one of the most ancient, it is natural that there should have crept into it the use of a large number of technical terms, and that these should have been derived from many sources. Even a casual acquaintance with them will show that while those of purely architectural meaning are largely derived from the Norman-French (evidently by way of the early monks), or have come direct from Latin and Greek, owing to the influence of Renaissance, those which deal with workmanship are almost all of purely English origin and meaning, and words in common use in ordinary life. "Breeze," for instance, has nothing to do with the wind, while "puddle" is not a pool of mud, but rather the wind itself. Children, too, might be amused to hear that a "monkey" and a "ram," a "punch" and a "dolly" are much the same thing, the two former names being given to the heavy weight which is dropped on to the top of a pile when pile-driving; the two latter to a block introduced between this weight and the pile when it is difficult to reach. Other terms which are taken from the names of animals are "sow" and "pigs," "worm" (an endless screw), and "pig's lug," which refers to a certain method of joining timber end to end; but a "dragon-tail" has nothing to do with the mythical animal, being merely a corruption of "dragging-tie"; and obvious resemblances have led to the use of the terms "bird's-mouth" and "swallow-tail." A certain number of terms, too, are named after articles of clothing, such as "pocket" (an opening in the side of a sash frame), "buckles" (fastenings for thatch), as well as the well-known "mitre" and "apron," together with "caps" and "shoes," which last are most appropriately fitted to "heads" and "feet" (of rafter struts) respectively. This brings us to, perhaps, the strangest series of all, those named after parts of the human body, almost every part being represented. There are "carcass" and "ribs," "face" and "cheeks," "elbows" and "knees," "shoulders," "noings," "back," and even "tail." "Pointing" is not done by the finger, but the mortar joints are frequently raked out with "an old woman's tooth." Another strangely named tool is the "boaster." Among the more modern trades, such as those dealing with mechanics, the same idea has been carried out, and where a word in common use has been found to apply, it has been often adapted, and in course of very few years has frequently obtained a special meaning. Examples of this are frequent, as in the case of the "clutch" and "eccentric," to name only two. It is also customary when this fails to name quite new appliances after their inventors, and a large addition to technical terms is to be found in such words as "Galvanic," "Voltaic," and "Watt," to give three common examples from those in use among electricians.

G. A. T. M.

At St. Paul's School, West Kensington, a week ago, the ceremony of unveiling in the great hall the mosaics of St. Paul and Dean Colet took place. The mosaics are placed on the apse on either side of the organ. It was originally intended in 1872 to have a recumbent figure of the Dean in St. Paul's Cathedral to replace that destroyed in the Great Fire. £2000 were wanted to complete the work, but that amount could not be raised, and the proposal was consequently abandoned and the present scheme adopted. The figure of St. Paul is on the left, and that of the Dean on the right, and the work is in rough mosaics. The total cost has been about £1200, and of that sum £400 has still to be raised.

AN OLD BERKSHIRE MANSION.

ABOUT three miles north-west of Hungerford stands one of the most perfect specimens of a Tudor house to be found in England. Littlecote is interesting in many ways apart from its architectural pretensions. The house stands in a finely wooded park, and nestles at the foot of the high downs, where the Kennet flows softly through the valley, yielding such baskets of trout as are not found everywhere; and it has the additional charm of having escaped the hand of the repairer and moderniser, having been inhabited since the Darrells built it in the last days of the fifteenth century. At the end of the great hall the Chief Justice's chair, built in a combination of triangles, still remains; and, says the *St. James's Gazette*, one of the most perfect collections of buff leather jenkins worn by the troopers of the Popham Horse, and the suit of armour worn by Colonel Alexander Popham, their leader, decorate its walls. The Pophams of those days were sturdy Roundheads, and opposed the King most bitterly. Colonel Alexander Popham was one of the Council of State in 1650, and a member of the Protector's House of Lords. He made his peace, however, with Charles II., and the wily monarch paid him a visit at his house which had once been the stronghold of opposition to his royal father. Littlecote again played an important part in the struggle between James II. and William III. Macaulay tells us how the Commissioners met at Littlecote, and William slept in King William's Room after the meeting. On that day, after they dined at Littlecote, "a splendid assembly had been invited to meet them."

THE OLD HALL

was crowded with peers, and Generals Halifax, Burnet, Nottingham, Shrewsbury, and Oxford were among those who sat round the old table and feasted, or intrigued, or listened, or dallied with the crisis. Halifax seized the opportunity, with his dexterous diplomacy, of extracting from Burnet all he knew and thought. "How, if the King went away?" whispered Halifax. "There is nothing so much to be wished," whispered the Bishop, apprehending his meaning. The Commissioners went away without any settlement, and the King soon fled. The painted room is unusually interesting, for the walls are entirely covered by pictures said to have been painted by a Dutch officer and other prisoners who were confined at Littlecote during the Commonwealth. During the Dutch war, when Van Tromp, De Ruyter, and De Witt were met by Blake and Monk, a number of prisoners were taken by the English and sent to provincial towns. One hundred were sent to Newbury, and the mayor petitioned Parliament that the town might be paid for their keep; upon which they were at once removed to Littlecote. Many of the pictures represent scenes from "Don Quixote," and some have been painted out, being more realistic than refined. The family papers in

THE PAINTED ROOM

at Littlecote, and which have never been published, possess a value hardly to be exaggerated, and it is to be hoped that some day they may be given to the world; and the Law Library of Chief Justice Popham and his books of reference, with his marginal notes, are truly curious. The Long Gallery is a beautiful room, 110ft. long, with a most interesting collection of family pictures; and over it is the dormitory, supposed to have been the quarters of the Littlecote garrison during the Civil Wars. The chapel, which is an interesting example of the arrangement of such a structure, was undoubtedly altered during the seventeenth century. The pulpit, as in all Presbyterian places of worship, occupies the place of the altar; and may we not almost believe that from it Bishop Burnett preached to the Commissioners. The house, with its picturesqueness, has an air of sadness, and the wooded downs which rise rapidly in front of it throw their shadow across its threshold, and rob it of sunshine and light; while the still air of the autumn day speaks only of a past, and never of a future.

THE CONSTRUCTION OF FIVE FAMOUS DOMES.

By JOHN A. MARSHALL.

(Continued from page 110.)

No. II.—THE DOME OF STA. SOPHIA, CONSTANTINOPLE.

THE pendentive system of vaulting had its origin in the endeavour to adjust the rectilinear plan to the requirements of the dome, as a covering. Though any polygonal plan will lend itself, more or less readily, to the adoption of this system, the conditions indispensable to its full development exist only in the perfect square. As an illustration of this, no better instance could be cited than the Church of Sta. Sophia, where the pendentive, in its simplest, yet most complete form, is the agency for the conversion of the square plan below into a circular one above, in order to form a fitting base from which to spring the dome. (Fig. 2, Plate IV., shows how this change is effected.)

Imagine a hemisphere intersected by the vertical planes of a square on whose angles it rests, and its upper portion, from the crown level of the intersections, cut off; the result will be the formation of a circle, having a diameter equal to one side of the square, and leaving of the original hemisphere only the four triangular portions known as pendentives. The constructional nature of the pendentive is that of a corbel, by which the weight of the dome is not merely sustained, but directed to the piers.

From this it may be said that the dome of Sta. Sophia has no actual direct support; and to this fact it is, in great measure, indebted for its well-known aspect of lightness and buoyancy, in this respect offering a striking contrast to the overpowering massiveness of the Pantheon.

The general idea for this church seems to have been a Greek cross with a central dome. This idea, however, was not carried out in its integrity; for, of the four arms of the cross, those on the north and south are screened off from the central space by arcades, which support galleries and clerestory walls; only those on the east and west, which are vaulted by semi-domes of nearly the same span as the central dome, being comprised in the body of the church. Opening out from these latter are smaller extensions, or exedrae, the aggregate presenting an unobstructed area exceeding 24,500 square feet, covered by a graduated system of domical vaulting, springing from one common level of 74ft. from the floor, and rising higher and higher, until it culminates in the grand central dome.

This extensive system of vaulting is mainly dependent on eight massive piers, each occupying an area of nearly 500 square feet, and carefully constructed of large dressed blocks of hard stone. The piers for the support of the central structure rise from the angles of a square, but are so arranged as to leave openings to the main extensions of 103ft. in width, and on the north and south sides of only 74ft. The square plan of the central compartment is obtained by forming a break of 3ft. in each pier; this defines the internal angles and provides the necessary planes from which to spring the four great arches that receive the pendentives. On the east and west these arches support the dome, and are brick barrel vaults about 13ft. on the soffit and 6ft. in thickness; they are open to the large hemispherical vaults that abut against them. The corresponding arches on the north and south sides are not the real supports for the dome, but are chiefly for the purpose of giving uniformity to the pendentives. They have a width of 3ft. on the soffit, which agrees with the break in the piers (Fig. 3).

The demand for increased strength on these sides, arising from the absence of semi-domes, has been met (1) by limiting the span of the supporting arches; (2) by giving them a depth

of nearly 16ft.; (3) by forming the curve for a considerable height from the springing with horizontal courses, thus still further reducing their span; and (4) by filling them in from the springing line, with clerestory walls, 4ft. thick, resting on the arcades.

It should be mentioned that these walls are flush with the inner face of the support-

The circle developed by the pendentives is at the height of 135ft. from the floor, and has a diameter of 103ft. On the top is laid a wide course of stone, with a projecting cornice; this gives a firm and even bed for the dome, the inner face of which is set back from the edge of the circle about 2ft.; by this arrangement the pendentives are somewhat relieved, and a

PLATE III

STĀ SOPHIĀ - CONSTANTINOPLE -

ing vaults, thereby concealing the awkward line of the arches inside, and leaving about 12ft. of the soffit exposed on the outside; but Messrs. Lethaby and Swainson, in their fascinating account of the building, have ventured the plausible hypothesis, that the enclosing wall was originally placed further back, on the plane of the outer face of the vaults, whereby a gallery would be left inside the church. This may have been so, yet, granting the waste of space lamented by M. Choisy, we can hardly regret it, in view of the peculiar charm afforded by the restraining character of the enclosing walls, in relation to the never-ending wonder of the vaulting.

gallery is provided, "on which the man who cared for the sacred lights could walk fearlessly, and trim each in turn."

The primary motive to the selection, for the dome, of a segmental, rather than a semi-circular section, was probably the desire to limit its weight. But, in addition to this, by springing the dome more gradually from the pendentives, the pleasing effect of the interior is, no doubt, improved. The internal diameter is 107ft., and the clear height from the springing 47ft.

Resting on the circular bed of stone before mentioned, are forty piers, 9ft. 6in. deep, and 3ft. 6in. wide, spaced regularly all round the

circumference. The intermediate spaces are arched over, at the height of about 16ft., to receive the remaining portion of the dome, the shell of which is gradually reduced in thickness to 2ft. at the crown.

The brilliant idea of piercing through the abutment, while virtually maintaining its continuity, and thus providing a range of windows at the base, appears in Sta. Sophia, not only fully developed, but as the earliest known instance of its kind; and though lacking the simple grandeur of the solitary eye of the Pantheon, yet, as a method of lighting, it is decidedly superior; it must also contribute in no small degree to that appearance of buoyancy for which the structure is said to be remarkable.

The ribs, with a slight projection on the inner face of the dome, in no way affect the homogeneity, to which quality may, doubtless, be attributed the extension of the fractures, by which the structure has, at various times, been imperilled.

The materials employed in the construction are well-burned bricks, 2in. thick, with mortar joints of nearly the same thickness; in the lower part of the dome the bricks are about 27in. square; at the crown they are 2ft. square. The joints do not radiate to the centre, but have a much flatter inclination, an expedient which would make it possible to carry up most of the work without continuous centering. This method was also adopted for the supporting arches. The curved face of the pendentives is corbelled over in brick, but the cavity behind is filled in with a light stalactical material, used in its natural state, without any preparation.

In turning the pendentives and the dome, it is probable that a method still practised in the East was resorted to. A pole, equal in length to the radius of the proposed hemisphere, is so attached to a central post that it can be swung in any direction, and thus made to describe the curves at every course of their height. The whole of the exterior of the dome is covered with lead, which serves as an effectual protection to the magnificent mosaic of the interior.

It is worthy of note, that generally, throughout the building, the supporting arches are merged, as much as possible, into the vaulting by forming a skewback all round the arch, either close to the soffit, or only a few inches above it, as in the pendentives of the dome, and the external angles are always rounded, to turn the tesserae of the mosaic. In this way all harsh lines are obliterated, the vast expanse appearing to be covered with a continuous, yet undulating, tissue of gold.

It must be obvious that, in a pendentive dome, a matter of the first importance is the limitation of its weight, and toward this end every available expedient, short of the omission of the crown, seems to have been resorted to in Sta. Sophia; the segmental form, the tenuity of the shell, the method of lighting, even the material employed, all contribute to that object. Still, the fact remains unaffected, that the stability of a dome elevated on pendentives and arches of wide span, can be effectually secured only by an extensive system of abutment applied to the substructure.

In the Pantheon the supporting wall has mass sufficient to withstand both the vertical and the horizontal pressure. But the Byzantine builders, wholly dispensing with walls under the dome, and extending the building on all sides, left only the four piers to sustain the vertical pressure; while for resistance to the horizontal thrust, they relied on the walls and vaulting of the surrounding buildings. Thus in Sta. Sophia the thrust of the immense arches on the north and south is fully withstood by the semi-domical extensions; while, to meet the enormous thrust of those on the east and west, huge buttresses are raised against the piers, whence they extend across the aisles and galleries to the outermost walls of the building, a distance of 50ft. These seeming obstructions, which are carried up their full projection nearly to the level of the platform surrounding the dome, are built hollow, and pierced with wide, vaulted openings on the level of each floor; thus preserving the continuity of the aisles and galleries.

M. Choisy has shown that these buttresses, and the square platform now surrounding the dome, were at one time much lower on the north and south, so that the curve of the dome protruded beyond the platform, and the extrados of the supporting arches was exposed. The buttresses and filling in over the arches were raised to the present level to render the abutment more nearly equal to that on the east and west. (Fig. 4.) Had the idea of the Greek cross been carried out in its entirety, and semi-domes raised on all the four sides, the statical properties of the structure would have been perfect, and all necessity for the clumsy expedients resorted to precluded. Yet, even as it is, the Church of Sta. Sophia is a remarkable instance of the skilful production, from the slenderest materials, of the grandest architectural effects, and of, perhaps, the finest combination of domical vaulting the world has ever seen.

HISTORICAL SKETCH.—The Church of Sta. Sophia was erected by the Emperor Justinian A.D. 532-7, on the site of one which had been built by Constantine the Great, and afterward destroyed by fire. The task of superintending the erection of the existing church was entrusted to two celebrated architects—Anthemius, of Tralles, in Asia Minor, and

Isidorus, of Miletus. Wishing to avert from it the fate of its predecessor, the Emperor gave instructions that the new building should, so far as possible, be rendered fireproof. But, unfortunately, it was less easy to guard against another equally serious element of danger, and twenty-two years after the dedication the eastern portion of the dome was shattered by an earthquake. It was speedily rebuilt, 25ft. being added to its height; while the buttresses, which had originally been carried no higher than the springing level of the great arches were raised to the present height.

Records also exist of repairs to the supporting arches in the ninth and tenth centuries; and at a date still more recent the dome itself was again fractured by an earthquake.

After the fall of Constantinople, A.D. 1453, the church was divested of its arrangements for Christian worship, though its general structural character remained unchanged.

No. III.—THE DOME OF THE DUOMO, FLORENCE.

We now approach the consideration of a work which presents a combination of ideas quite unfettered by the influence of preceding examples.

STĀ-SOPHĪĀ-CONSTANTINOPELE

PLATE IV

The conditions on which the Dome of the Duomo is turned have little in common with those attaching to an ordinary dome. The latter is generated by the rotation of an arch on its vertical axis, when the section, taken in every direction, will be exactly the same, and the thrust uniform all round. But in this dome, springing as it does from an octagon, each of the sides is, so to speak, a portion of a separate vault, and exerts a distinct and independent thrust. Consequently the dome lacks that coherency and strength which are associated with the circular plan, and the problem has been how to give to the structure the necessary stability while retaining the octagonal form.

Another equally important factor is the lantern, and from a report made to the Building Committee before the commencement of the dome, we learn that in his selection of the pointed form of arch in preference to one of semi-circular section, the architect was mainly influenced by the hope of securing adequate support for this additional feature. He points out that were the dome to be turned in a semi-circle, the great extent of the crown would certainly cause it to give way when the lantern was placed in position. "I have, therefore, determined," he continued, "to adopt the proportion and manner of the pointed arch, so that, when loaded with the lantern, each part will help to give stability to the others." This is perfectly in accord with the well-known fact that the tendency in a pointed arch without surcharge is to break up by rising at the crown and falling in at the haunches. And though this may also hold good of a dome of polygonal plan, it is evident that it does so to a far less extent, by reason of the lateral pressure at the angles.

The original tendency of such a dome is, by the superadded weight of the lantern, more than counteracted; the opposite tendency—an actual bursting pressure—being thus generated. The point at which the greatest force is exerted must, of course, depend on the pitch of the dome; the higher the pitch the less will be the thrust, and the lower the point of greatest weakness.

In a dome of circular plan and of uniform thickness, if its radius, drawn to the vertex, make with the vertical an angle of $22\frac{1}{2}$ deg.—as in the example under notice—its inherent thrust will be greatest at a point making with the horizontal an angle of $13\frac{1}{2}$ deg. And though the great Florentine dome lacks the first of these conditions, the expedients adopted with a view to its security bring it very nearly under the operation of the laws which govern an ordinary dome.

With reference to the substructure, it is worthy of remark that the octagonal plan here adopted possesses a decided advantage over the square, in that it admits of double the number of supports, and affords facilities for abutment at all points. Thus the idea partly acted on in Sta. Sophia, of extending the building on all sides in order to secure an equilibrium of forces round the central structure, is here fully carried out.

The octagonal space covered by the dome has a diameter of 138ft. 6in. Four of the sides are open to the main extensions, and spanned at the height of 100ft. by semi-circular arches of 50ft. span, and a depth of 16ft. To resist the thrust small adjuncts are built against the intermediate sides of the octagon, which, on the west, are pierced obliquely by comparatively narrow archways, whereby the aisles of the nave are continued to the central area.

This arrangement has the effect of reducing the supports at the western angles to two detached piers, which receive the arches of the nave arcades. Being thus surrounded by buildings, the central octagon possesses, in their walls and vaulting, a complete system of abutment to the height of 135ft. From this level the dome was to have sprung, according to the intention of the original architect; but his successor, believing the abutment sufficient for his project, carried up the wall to the further height of 40ft., thereby emancipating the structure from the manner of all preceding examples. This additional story is analogous to the tambour, or drum, of later domes; of

-THE DUOMO - FLORENCE-

50 25 0 50 100

which, indeed, it may be said to have been the prototype. It not only relieves the supporting arches of the direct horizontal pressure of the dome, but also affords increased facilities for lighting, and gives great additional prominence to the structure.

The wall of the tambour is 16ft. thick, and on each of its sides is pierced with a circular window, 14ft. in diameter. This space for the admission of light is small in comparison with that provided in domes of more recent date; but, seeing that the full force of the twofold pressure is borne by the tambour alone, unaided by counterforts, the conservation of the strength of its walls was an absolute necessity.

From the wall of the tambour, at the height of 178ft. from the floor, the dome springs, rising to the additional height of 118ft. In the various methods adopted for imparting to this octagonal vault, so far as possible, the structural qualities of a circular dome, may be found material for an interesting study. To bring about the desired result, the eight distinct sides must be so united, or conjoined,

as to form one compact, coherent, and self sustaining whole, which should also be able to support the lantern.

In the first place we cannot fail to admire the judgment and skill of the architect in giving to the dome its cellular structure. By this apparently simple expedient he successfully attained the necessary degree of lightness, without any sacrifice of the requisite mass and strength.

The total thickness, which is nearly uniform, is about 14ft., and to the height of 10ft. from the base, consists of solid masonry, the two topmost courses of which are long plates of hard stone, laid transversely, thus forming a firm bed for the dome. From this point to the further height of 15ft., the inner vault has a thickness of 7ft.; and for the remainder, of about 6ft. At the angles, and occupying the full depth of the cavity and passing through both vaults, are eight ribs of stone, which diminish in width from 9ft. at the bottom to 2ft. at the top. On each of the sides are two other ribs, less in width, but

otherwise similar to those at the angles. At short intervals from the level of the second gallery, transverse arches or buttresses, at right angles to the vaults, spring from the main ribs, and, spanning the space occupied by the two intermediate ribs, tie the whole together and secure the outer vault (Fig. 3). At the top the ribs are received by the walls which circumscribe the central opening and support the platform for the lantern.

It will be seen that in the cellular mode of construction here adopted the disposition of material is somewhat on the principle that obtains in constructional ironwork, the ribs serving to stiffen the vaults and to restrain any tendency to open at the angles owing to pressure exerted by the lantern. The rapid decrease in width of the ribs generally in their ascent may also be regarded as an ingenious application of the principle which forms the basis of the abutment system. Yet the most important element in aid of the support of the lantern is, without question, the high pitch of the dome, combined with its great relative thickness. But with a view to greater security a strong belt or chainwork, consisting of beams of chestnut laid in the space between the vaults and passing through the counterforts, engirdles the inner vault at a level near to what would in a circular dome of the same pitch be mathematically its weakest part (Plate VI., Fig. 4).

The outer shell is by no means indispensable to the stability of the dome, it serves rather as a covering to the system of counterforts. Its greatest thickness is about 3ft., which slightly diminishes in the ascent.

The passages which surround the octagon in the cavity between the vaults have their floors supported on ribs built into the vaults at each end, and thus impart additional strength to the structure.

The small circular apertures in the inner vault, with recesses opening from corridors, were provided with a view to the suspension of scaffolding for the fixing and the repairing of the mosaic with which the interior surface is covered. Similar openings in the outer shell serve for the admission of light and air into the cellular spaces. (It may be mentioned that in the erection of the dome centering was altogether dispensed with, and no framed scaffolding was used for the first 50ft.)

The ribs are constructed entirely of stone laid in radiating courses, and the two vaults are of stone up to a height of about 40ft., the remaining portions being of brickwork to limit the weight. On the exterior it is covered with tiles, though the original intention was probably to face it with marble, but the only portions so completed are the moulded ribs, which give prominence to the angles, thus bringing the lantern into closer harmony with the rest of the design.

Following the octagonal plan of the central aperture, the lantern has an internal diameter of about 20ft., and, including the cupola, a height of 45ft. This portion is wholly of marble. It is capped with a conical roof of timber, covered with lead, which supports on its apex a metal ball and cross, making the total altitude from the floor about 385ft.

The skill shown in the methods employed for restricting the weight, while preserving an effective outline, and also in the arrangement of the supports, whereby the weight of the lantern is brought to bear directly on the main counterforts, is worthy of the highest praise.

The fractures—due, as is generally supposed, to settlement—which appeared in the dome about 200 years after its completion, having been secured with dove-tailed cramps, did not extend beyond their original limits. The partial subsidence of the foundations, to which they are attributed, may, in its turn, have been caused by the excessive weight of the superstructure, in combination with the unequal disposition of its supports. Yet, though in these respects the dome of the Duomo may somewhat unfavourably compare with other well-known examples, the novel system adopted in its construction must be said, upon the whole, to have successfully stood the test of time.

It is greatly to be regretted that a struc-

ture, so conspicuous amid its surroundings, should be marred by the incompleteness of one of its most important features. This has reference, of course, to the absence of the cornice, with galleries, round the top of the tambour, on the exterior. These, which formed part of the original design, would certainly prove a valuable acquisition to the building; and their addition, even after the lapse of nearly five centuries, would be a fitting, though tardy, tribute to the memory of its great architect. But even in the absence of these, he is justly entitled to the eminent distinction

architects and engineers was convened at Florence to discuss the question. At this conference the idea of raising the dome on a drum was first introduced by Filippo Brunelleschi, who had long been meditating a scheme for its completion. Failing to agree, the conference separated without any practical result. Several years later the question was reopened by the authorities again, seeking the advice of Brunelleschi, who suggested another Convention, to consist of leading native and foreign architects. This assembly met at Florence, A.D. 1420, when Brunelleschi fully detailed his

of having prepared the way for what has been termed "the modern type of dome," as exemplified in the masterpieces of Michael Angelo and Wren.

HISTORICAL SKETCH.—The erection of the Duomo was commenced within a few years of the close of the thirteenth century, from designs by Arnolfo da Lapo. At the time of his death, A.D. 1300, the work had not been carried higher than the springing of the vaults. Toward the erection of the dome no steps were taken until A.D. 1407, when an assembly of

scheme; and the authorities, having no better before them, requested him to furnish a report in writing. This was done; the architect explaining, with great minuteness, the design which was eventually carried out. This document—which has fortunately been preserved, and will be found an invaluable aid to an intelligent study of the structure—obtained for its author the commission for which he had long laboured. But it was, even then, hampered with humiliating conditions:—(1) That he must not proceed beyond a certain height

without the further sanction of the authorities; and (2) that, even during this portion of the work, he would not be entrusted with the sole control; for, at the instance of certain influential citizens, Lorenzo Ghiberti, the sculptor, was appointed as joint architect. The incompetence of the latter, however, became so patent as the work proceeded, that he was relieved of all responsibility, and Brunelleschi was appointed chief architect for life.

Thinking it probable that he might not live to see the completion of the work, he prepared, in 1434, a model, and specifications for the lantern, inserting in his will instructions for its erection accordingly—in case of his death. When that event took place, the lantern had been carried to a height of several feet, and most of the stone prepared for the remainder.

Not until the year 1461 was the topmost stone of the lantern laid, and on this Andrea Verocchio erected a ball and cross, which, being thrown down by lightning in 1601, were afterward replaced by those now existing.

WROUGHT IRONWORK IN CONSTRUCTION.

IN looking through the curriculums of the various architectural institutions, it is surprising to notice what little prominence is given to the study of constructional ironwork. The reason for this no doubt lies in our national conservative principles, but it must be generally acknowledged that iron has yet a very wide field for development in Architecture. Students have little or no encouragement to take up the study, and those studying under the masters of the Profession, perhaps more so than others, will regard one with a feeling akin to disgust if the subject be proposed to them. Architects foster this feeling among their pupils, as when they are tempted to use an iron stanchion or other form of construction, they are in a strangely desperate hurry to design its cloak and get the offending material out of sight, with perhaps lingering qualms of conscience for its adoption. It would be a much fairer treatment of the material if, instead of adopting a stock section, and employing a casing to obtain architectural effect and a wretched sham, a theoretical knowledge was applied in designing a section that could be used fearlessly without a casing. It is clearly impossible under present circumstances to hope to improve upon or bring into closer sympathy with Architecture the "engineering monstrosities" in the way of bridges and roofs which have been erected of late years. The greatness of these erections lies in their vastness of conception, and what little thought is given to architectural treatment is in almost every case misapplied. We cannot expect an engineer, whose architectural knowledge and training consists of having read a secondhand treatise on Gothic Architecture, to design beautiful structures. It is just as impossible for an architect to think of designing an iron structure without a theoretical knowledge. It rather staggers one to think of a church with an open iron roof; but why not? With its curved ribs and bracing springing with beautiful lines from tall slender columns one might look forward to an interior which for proportional effect would equal any Gothic cathedral. Certain it is, however, iron will figure as the generating factor of a new architectural period. The older members of the Profession cannot be expected to undertake a tedious course of mathematics, but it is surely time that more thought was given to the preparation of the younger members for the study of this important but much abused material.

A NEW CHURCH AT HARROGATE.

THE new church of St. Luke's, which has been in course of erection during the past two years in the northern part of Harrogate, was consecrated recently. The church occupies a prominent site in Walker Road. The new church extends over an area of 4000 yards, with a quick fall from the east, thus giving the west gable of the church a commanding position. The style is Decorated Gothic rather late in type, and principally characterised by the elaboration of the window tracery. The plan consists of a lofty nave, chancel, north and south aisles, south chapel, double transepts on the north and south sides of the nave, lofty organ chamber on the north of the chancel, and commodious vestries for the clergy and choir. The principal dimensions are:—Length within the walls 120ft., breadth across the transepts 70ft., and height of nave from floor to ridge 54ft. A lofty tower and spire are designed for the west front, but the lower stage only has been built, and forms the baptistery. The tower staircase is crowned with a temporary roof, and forms the bell turret. The nave is divided into six bays, with lofty octagonal pillars carrying moulded capitals, and

ARCHES IN TWO RIMS

with label mouldings, and above this arcade is the clerestory, containing two light windows, with tracery of alternating pattern in the heads. The west gable of the nave contains two lofty windows with tracery heads and moulded arches, together with a two-light pointed in the apex. A massive centre buttress terminates in a canopied niche intended to receive a statue of the patron saint. The east gable of the nave contains a lofty and elaborately moulded arch opening into the chancel, carried by moulded pillars with carved capitals. Single-light windows are placed in the side walls of the aisles, with a traceried window in the west end. The two double transepts open into the aisles by stone pillars and arches, and are lighted by four-light windows in the gables filled with tracery of elaborate pattern. On the south of the chancel three well-moulded arches open into the south chapel, and contain carved and traceried oak screens, and a larger archway gives access to the south chapel from the transept. The chapel is of three bays with square-headed windows at the side and a traceried four-light window in the east gable. The east window of the chancel is of five lights, well moulded, and filled with excellent stained glass by Messrs. Burlison and Grylls, of London, and on the north and south sides of the chancel are inserted triangular clerestory windows filled with tracery. The east window is one of the principal features of the church. Its general idea is the Te Deum. In the centre of the tracery is the Agnus Dei, surrounded by seraphim, cherubim, and angels. These hold scrolls with the verses: "Holy, holy, holy, Lord God of Sabaoth. Heaven and earth are full of the majesty of Thy glory. To Thee cherubim and seraphim continually do cry." In

THE CENTRE LOWER LIGHT

our Lord in glory standing crowned and holding the orb; underneath, on a scroll held by angels, is the text: "Thou art the King of Glory, O Christ. Thou art the everlasting Son of the Father." In the left-hand side lights St. Peter the Apostle, with the scroll: "The glorious company of the Apostles praise Thee"; and Isaiah with the scroll, "The goodly fellowship of the Prophets praise Thee." In the right-hand side light St. Stephen the Martyr, with the scroll, "The noble army of Martyrs praise Thee"; and St. Wilfrid, bishop and patron saint of the diocese, with the scroll, "The Holy Church throughout all the world doth acknowledge Thee." In the lower tier are our Lord on the cross occupying the central light, St. Mary the Virgin on the left, and St. John the Evangelist on the right. The two outer lights on the left St. Luke (patron saint) holding the church, and St. Paul on the right. The figures are placed on richly coloured diapered backgrounds under canopies. The principal entrance of the church is by the south porch, which contains an elaborately moulded archway, with carved capitals and moulded pillars, and in the apex is a traceried

niche to contain a figure of our Lord with attendant angels. Other entrances to the church are in the north and south transepts, and at the west end of the north aisle, this latter being intended for exit only. The whole are provided with oak doors made to open outwards. The roofs, excepting to chancel, are open timbered of pitch pine, neither stained nor varnished, boarded, felted, and covered with Westmoreland slate. The ceiling of the chancel is wagon-headed, moulded, and panelled. The seating for the choir is of oak, elaborately carved and moulded; the remainder of the seats being of pitch pine varnished. Fixed sitting accommodation is provided for 760 persons, a space being reserved at the west end for chairs, which will increase the accommodation to 850 persons. The floors of the passages and chancel are laid with tiles, and the warming is by hot water pipes, special precautions having been taken to prevent down draughts from the roof. The pulpit is of stone, a special gift of the builder, Mr. Isaac Dickinson, and is octagonal in form, springing from a moulded shaft, enriched with panels of open tracery and finished with a delicately carved cornice. The lighting is by gas pendants suspended from the walls opposite the centre of each arch, and the windows are filled with clear cathedral glazing. The work has been carried out by the following contractors:—Masons, Mr. Isaac Dickinson; joiners, Mr. James Taylor, of Yeadon; plumbers and glaziers, Messrs. E. Pratt and Son; plasterers, Messrs. B. Sugden and Son, of Bradford; slaters, Messrs. Baynes; painter, Mr. Dent. The stone carving is by Mr. J. Elliot and Mr. S. Charnock, the pulpit and font by Mr. P. Woods, of Harrogate, the gas fittings by Mr. T. Powers, of Manchester, and warming apparatus by Messrs. Seward, of Lancaster. The entire building, including boundary wall, will cost about £10,000, and has been carried out under the superintendence of Mr. G. H. Elliott, clerk of works, from the designs of the architects, Messrs. T. H. and F. Healey, Bradford.

LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday of last week at the County Hall, Spring Gardens, Dr. Collins, chairman, presiding.—The General Purposes Committee recommended that Mr. Blashill, the superintending architect, who contemplated retiring from the service of the Council, be requested to continue to hold his appointment for another year as from December 8th next. His retirement at this time would cause great inconvenience to the public service, and he was willing to place his services at the disposal of the Council for another year.—The report was agreed to.—On the recommendation of the Improvements Committee the Council sanctioned an expenditure of £207,400 for the carrying out of the Long Lane and Tabard Street, Southwark, improvement, for which the sanction of Parliament has already been obtained. The scheme provides for the widening of Long Lane and the continuation of Tabard Street, through St. George's Churchyard, into Borough High Street.—The Theatres Committee brought up a report stating that a set of amended plans had been submitted for the fitting up of Olympia for the purposes of Messrs. Barnum and Bailey's show. The original plans, which were rejected by the Council, did not provide any proper division between the stage and the auditorium, and the arrangements for the stabling of the horses were not satisfactory. The new plans showed an iron screen with asbestos on expanded wire to be built on both sides of the stage to form the wings of the proscenium, and the portion over the proscenium opening would be suspended from the roof, and would consist of an iron frame with a covering of asbestos cloth. A moveable curtain of the same construction would be provided to the proscenium opening. Increased gangway accommodation was also shown. With certain conditions attached, the Committee thought the plans might be approved.—The Council adopted the report.

A REMARKABLE engineering feat was accomplished on Monday week.—the Pennsylvania Railway Company removed the old bridge over the Schuylkill river, and simultaneously replaced it with a heavier steel structure 242ft. long and 25ft. wide. The moving operation was completed in 2min. 28sec.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

November 3rd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ART teaching is a very different thing to what it was at the beginning of this generation, and the effect of it may be seen in the changed aspect of things that surround us in our daily lives, whether it be a book-cover, a wall-paper, a water-pitcher, or the ubiquitous poster. Human limitations forbid that great artists should ever be numerous. But it is possible, by training, to educate the sense of the beautiful, latent in most peoples, and capable of being expressed by a certain proportion of individuals to a degree that causes a marked change to take place in the public taste as exhibited in dress and the household. And this will be acknowledged to have been accomplished in our own country, if we compare the every-day surroundings of forty or fifty years ago with those of the present. The world hears of the great Masters of Art, but, for the most part, it does not know anything about the little army of artists who make life more beautiful in a wider sphere than that enclosed within the walls of a palace or a picture gallery. If it did it would perhaps be surprised to learn how many of them are women. Among the organised forces that tend to produce such, the institution in Queen's Square is one of the most important. The exhibition of students' works which has just been held is as gratifying on the score of the high level attained generally as on the excellence of that which has gained awards. We believe that the school has turned out not a few students who have achieved success in the paths of Art.

THE appearance of hoardings around the premises on the west side of Parliament Street marks the beginning of one of the biggest Government schemes of building that London has witnessed for many years. It is proposed to accommodate here the Board of Trade, the Education Department, and an extension of the Local Government Board. The frontage will be in line with the Home Office, so that a considerable metropolitan improvement will be effected at the same time. As a consequence, the County Council is to be asked to contribute towards the cost of the land that will be given over to the public. Doubtless, this will be arranged without much question. In any case the Government will be involved in a very heavy expenditure, for the estimated cost of the new offices on this and smaller adjoining sites runs to nearly two millions.

KING STREET will entirely disappear under the scheme, and London will lose an old and historic thoroughfare. Long before Parliament Street was made, King Street was the only way from Whitehall to Westminster Abbey. It originally extended from Charing Cross to the King's Palace at Westminster. Lord Howard, who led the attack on the Spanish Armada, lived in King Street; and here Queen Elizabeth's Privy Councillors used sometimes to hold their meetings. It was here, too, where Edmund Spenser, the poet, died. It was in King Street, also, where Sir Henry Wootton had lodgings, the author of the celebrated

saying that "ambassadors were men sent to lie abroad for the benefit of their country."

AN effort will be made next session to amend the Act for the protection of ancient monuments. The object of the amending Bill will be to extend the powers of the inspector, so that the "blessed word compulsion" may be submitted for the "voluntary" provisions of the existing law. There is a prevalent idea that General Pitt-Rivers exercises authority of some sort over all "ancient monuments" in the country, but as a matter of fact his authority as inspector is derived from the voluntary action of the owners of such monuments. Consequently, he has been powerless to prevent sundry acts of vandalism which have destroyed certain of our most interesting antiquities, and Stonehenge itself might be destroyed to-morrow in spite of General Pitt-Rivers and the Act which he administers if the owner of the ground chose to do so. Of course there is little risk that such a moral crime would ever be perpetrated, but a correspondent learns that a crime of this kind, only less heinous in degree than the destruction of Stonehenge would be, has been actually committed in another part of the country, and a most interesting "ancient monument" broken up to provide "metal" for the roads in its vicinity. So there seems to be urgent reason for the amending Bill which is in contemplation, and which it is to be hoped Parliament will pass without delay.

THE site of the prehistoric Celtic lake village near Glastonbury has been further excavated since July, under the superintendence of the discoverer, Mr. Arthur Bulleid. The sites of the dwellings are marked by mounds. One of these opened this season was found to contain the framework of a loom, which must have been discarded and deposited there with the brushwood and wattelwork, which forms the foundation of the dwellings. As in each previous season, a large number of bone articles have been discovered. In one mound the number of broken bone needles and splinters of bone seem to indicate that it was used as a needle factory; another mound was very rich in fragments of pottery, and other evidences of the manufacture of hardware. No less than ten bronze fibulæ were found, being in all respects like the modern safety-pin. When only a short distance below the surface, even bronze, although retaining the appearance of stability, becomes very fragile, but when coming from deep in the peat, the preservation is always excellent. A neatly-cut iron file, of about 8in. long, was found.

A NEW scheme has been put into operation in connection with the work of the National Trust for Places of Historic Interest or Natural Beauty. As its name indicates, the object of this Trust is to preserve all that is beautiful and historic in scenery and buildings, and the better to do this it is proposed to establish local branches, whose business it will be to report to headquarters any danger that may threaten archaeological or historic objects. Apart from the preservation of things ancient and interesting, a register of which is to be kept, this scheme will serve a useful purpose, inasmuch as it will furnish the Jonathan Oldbuck of the present time with valuable information respecting antiquarian curiosities in all parts of the country.

VISITORS to Paris have all remarked the ruined buildings opposite the Jardin des Tuileries, and have wondered, no doubt, why a thrifty people like the French should have allowed so fine a site to remain the abode of bats and owls for the past quarter of a century. But all that is going to be changed. The Cour des Comptes, as the building was called before the torch of the Communard was applied to it, is once again to be turned to human uses, the French Chamber of Deputies having voted the Bill empowering the Orleans Railway to extend their line and place their terminus there. To the travelling public the new station will be a great boon.

ALAS, for the glory of the Barnato Mansion in Park Lane; it is rapidly being stripped of its outward adornment. Scaffolding has been erected, and workmen are engaged scraping off the lavish ornamentation of pillars, walls, and windows. They have not started with the sculpture, but it is all to come down. One thing certainly will have to come away: that is the monogram of Barney Barnato, which was skilfully introduced within a medallion in the background of one of the most interesting groups of figures. It seems that Sir Albert Sassoon prefers a plain exterior to his new dwelling; or, as a hard Philistine unsympathetically puts it: "He wants his house to be a little less like an insurance office than it now is."

THE late Sir John Gilbert may fairly be said to rank among the most prolific artists of our own or any other time. Since his first appearance as an exhibitor, in 1836, he showed no less than 375 works in oil and water-colour at various galleries; and that in spite of the fact that he was one of the busiest illustrators on record. During his life he must have produced some thousands of studies and black and white drawings. His rapidity of production is in some measure to be accounted for by his habit of working entirely from imagination; he rarely, if ever, drew or painted from models, and yet, in spite of the definiteness of his style and the strong individuality of his manner, he repeated himself hardly at all. His pictures were always easy to recognise, but if compared with one another their variety was extraordinary.

MR. T. S. ROBERTSON, architect, Dundee, will shortly publish through Messrs. Gay and Bird, London, a work on "The Progress of Art in English Church Architecture." The author aims at conveying a distinct impression of ideal beauty as it is found in Gothic Architecture. He has been led to prepare the volume through the want of a proper study of English Church Architecture as a whole. The Cathedrals of England have been fully dealt with separately; but Mr. Robertson traces the evolution of ecclesiastical Architecture from a survey of the whole. He has written, as far as possible, in non-technical terms, so that the work will be of equal interest to the general reader and to those specially informed. The volume will be illustrated by sketches from churches of all the periods of English Architecture from the Norman Conquest to the reign of Henry VIII. All the illustrations are from drawings by Mr. Robertson.

THE large invitations to the Lord Mayor's banquet on November 9th are this year of a more tasteful character than usual. Instead of bearing a gaudy-coloured design of a commonplace type, the cards are printed from a copperplate in brown ink on proof paper, and with their Chippendale scheme of ornamentation they have an excellent effect. Small views are given of the Diamond Jubilee ceremony at St. Paul's, the Lord Mayor's banquet in 1837, at which Her Majesty was present, the Tower Bridge, and the Guildhall, while reproductions are shown also of both sides of the medals issued on the occasions of the opening of the Royal Exchange, the thanksgiving service after the Prince of Wales's illness, the opening of Blackfriars Bridge, and the dedication of Epping Forest. Portraits of the Queen at the date of her accession and at the present day complete the design, into which the lettering falls naturally and unobtrusively.

AT a recent meeting of the City Commissioners of Sewers, it was referred to the Finance and Improvement Committee to consider and report upon the important rebuilding scheme of the Bridge House Estates Committee, with regard to London Wall, in order to effect a widening of the thoroughfare.—The Streets Committee reported upon an application from the Central London Railway Company for permission to proceed with the staircase to the underground station at the corner of Queen Victoria Street and the Poultry by Messrs. Mappin's. The Committee recommended that the Company should be allowed to commence operations accordingly, subject

to the hoarding with which it would be necessary to surround the works being erected and maintained to the satisfaction of the engineer, and on the condition that the hoarding was only to remain during the pleasure of the Commission, and that no advertisements should be placed thereon.—Messrs. Mappin and Webb wrote, pointing out the serious loss which the erection of such a hoarding would cause them, and suggested that iron railings which might be covered with a tarpaulin while the excavations were going on might be substituted.—The Chairman said the engineer would look after their interests.—The report was carried.

THE report of the trustees of the National Portrait Gallery is extremely interesting, for it proves beyond dispute how popular the collection has become since its transference to a building where the pictures can be seen under reasonable conditions. Already the new building is in need of considerable extension, for there is practically no room available for the additions that are being steadily made to the collection, and in a short time the rooms must become inconveniently overcrowded.

PENDING the provision of buildings suitable for the housing of such a valuable collection of Art and Science subjects as that at South Kensington, the Select Committee on Museums has made its first report. Some of the features of the report have been anticipated, but the feeling of alarm which the original announcements created is shown to be fully warranted. The report speaks of "a number of old buildings, built of wood and lath-and-plaster, and in some instances covered with tarred felt, in close proximity to the modern permanent buildings which contain the bulk of these collections;" and says the "roofs of the galleries in which the Sheepshanks and Jones collections, the Chantrey Bequest, the Water-Colour Gallery, and the Dyce and Forster collections are housed are constructed mainly of unsuitable timber, and are especially open to fire damage from the fact of having wood lanterns, skylights, and open side-lights;" "the private residences of the officers of the department, in the immediate vicinity of the galleries, are a further source of danger. The whole of the floors are of wood, the partitions running up and dividing the upper stories are of wood, the staircases are of wood, and the roofs are also of wood. The party-walls dividing the residences have not been carried through the roof. There are eighty-one open fire-places." The Committee expresses its very strong opinion that permanent buildings for the adequate accommodation of the collections at the South Kensington Museum should be proceeded with without delay. They are of opinion that it will be a source of grave discredit to the country if the settlement of this matter, which has been the subject of consideration by Government for many years, and of endless correspondence between the Departments concerned, is any longer delayed.

THE old sessions house and prison in Well-close Square, "within the Liberties of the Tower of London," is about to be pulled down. The carved oak, the panelled walls, the hammered iron-work, and above all the wood upon which is cut and scratched the names of its one time captives, will be scattered to the four quarters of the bric-à-brac world—to Whitechapel and Wardour Street, to Great Portland Street and the Old Kent Road.

A RELIC of olden days has been found in a field in the parish of St. Michael's, South Elmham, Suffolk, in the form of a pierced stone hammer. The weapon, or tool, of which this was the head, would be a formidable implement in the hands of a strong, active warrior. It measures 5½ in. long by nearly 4½ in. wide, and is 1½ in. thick, while the weight of it is 37½ oz. It is a piece of very hard quartzite stone, similar to many which occur plentifully in the road material of Suffolk, but which the road menders find so stubborn to deal with that instead of running the risk of breaking their hammers in attempting to crack them they usually throw

them into the deep ruts or into the hedge bottom. The broad end of this ancient "celt" is considerably abraded with use.

THE autumn exhibition at the Grafton Gallery, which opened on Saturday week, has been organised by the Society of Portrait Painters and the Society of Miniaturists. The former, which occupies all the rooms but one, is quite as interesting as any of its predecessors, though the great size of the galleries has led to the admission of a certain number of large pictures of somewhat inferior quality which do not tend to raise the level of the exhibition. The modern painters of full-length portraits, in the praiseworthy desire to escape from the commonplace mid-Victorian type, can think of nothing better than to imitate either Velasquez or Sir Joshua—Velasquez being seen, so to speak, through the spectacles of Mr. Whistler, and Sir Joshua's compositions being often almost copied after some of the prints which are now so much in vogue. There are examples in the present exhibition that will strike everybody, for there is no getting away from great full-length portraits which, like the little girl in the song, if they are not "very, very good," are apt to be "horrid." As usual, the exhibition is fairly comprehen-

THE RATHS KELLER, HALBERSTADT.

BY W. HARDING SMITH.

(At the Society of British Artists' Exhibition.)

sive, admitting foreign as well as home-grown Art, and a certain number of pictures that have been seen before as well as new work.

CASTS of the frieze and metopæ of the Athenian and Siphnian Treasuries, discovered at Delphi, have been prepared under the direction of M. Homolle, for the Louvre, together with other antique fragments, including the bronze charioteer. It is to be hoped that replicas will find their way to Bloomsbury or South Kensington, as the Delphi remains illustrate an important period in the history of Greek Art.

THE latest Art competition is one instituted by the London Corporation for designs for a medal to commemorate the Diamond Jubilee. Prizes of £50, £20, and £10 are offered for the best designs, which are to be adjudicated upon by a committee of the Corporation, aided by competent professional advice. The rewards offered do not seem princely, but they will no doubt be sufficient to induce a great many artists to compete, as there is plenty of unoccupied talent about. It remains to be seen, however, whether really first-class men will care to submit their productions to the test of a public competition.

MESSRS. POWELL, of Whitefriars, have designed, and Messrs. W. H. Smith and Son, of the Strand, have published, a set of six bold cartoons of the leading events in the life of our Saviour. By their general style, we should suppose they were originally drawn as subjects for stained glass work, but they are cold in colour, with one or two exceptions, and even these would have been better had the tints been more vivid. The least unconventional is the Annunciation, where the Archangel is a noble figure, the garb richly dight. There is colour, too, in the scene of the natal stable. But the baptism by St. John the Baptist, the Crucifixion (on a scale much larger than the rest), the Resurrection, and the Ascension need brightness if they are to tell the Great Story in an effective way. However, they will be welcome in schools. To our mind, the best kind of wall picture would be reproductions of the works of the great masters. Why should not the Annunciation, the Virgin and Child, and all the great events of the sacred story be shown to the children's eyes as Fra Angelico, Perugino, John Bellini, and Raphael pictured them?

THE very fine parish church of Poynings, at the foot of the Dyke, dating from the fourteenth century, presents so large a surface to the elements that it is somewhat difficult for the small community of villagers to meet the recurring cost of the needful repairs. By the advice of the architects, who have reported on the church, Messrs. Clayton and Black, of Brighton, the flint casing of the south wall of the tower (in some parts covering only chalk, as is not uncommon in these old Sussex churches) has been carefully renewed, but a good many other repairs are urgently needed. The village and its church are so frequently visited by admiring tourists that there should be no difficulty in getting together all the funds required for the proper preservation of this interesting fabric.

SOME interesting demonstrations have just been held at the "Alma" Board School in Southwark Park Road, Bermondsey, of the method of teaching design by the use of brush and coloured chalks, introduced considerably of late into the Kindergarten training and home tuition, as well as into a few of the elementary schools, and now permitted by the Committee of the London School Board as an alternative system for the use of teachers who disapprove of the old curriculum established by the Government Art Department. It is no secret that a respectful difference of opinion has long been rife as to "how to teach drawing." The long and tedious course of freehand copies, and toiling at the lights and shadows of casts from the antique, have led to a revolution in favour of more rapid processes. It is well-known, for instance, that Mr. Ablett's system has been doing good work in high schools all over the kingdom for many years past. It is based on class demonstration to teach observation of facts and the drawing of natural objects; and includes brushwork with much more besides. Here is another system, arranged by someone else, and consisting mainly of free use of the brush with a geometrical basis to work upon. When all is said and done, the higher branches of Decorative Art still sit up aloft, and design can no more be taught, beyond a certain point, than a great composer of music can be created merely through acquisition of all the laws of harmony. It is certain that those classic forms of Art that students spend years in trying to imitate, were done by men who had to begin with the ways of Mother Nature for the starting-point; and so our progress in methods seems to be to find this out. The ancient Egyptians, the Greeks, and the Japanese have done the same kind of thing that the sons of the labouring man in Bermondsey are striving at to-day.

THOSE who manage the affairs of the French Salon have declined the offer of the Government to place at their disposal the machinery gallery of the old Exhibition for their next two years' Exhibitions, in lieu of the old building which has been destroyed to make

way for the 1900 show. It is said that they see some veiled sarcasm in the name of the locale. It has been suggested that it would not be altogether disastrous to French Art if the Salon were discontinued for the two years, as the artists would have that time at their disposal to make more serious efforts for the Great Exhibition. But this can never be entertained; for there is not only the sentimental objection of breaking the continuity of a series which has extended for so many years, but there is the financial one.

AN exhibition of trades and inventions was recently opened at the People's Palace. The exhibition occupies an annexe temporarily erected for the express purpose, and adjoining the winter garden of the palace. There are about 200 exhibitors, including trading firms as well as artisan inventors, and the most gratifying exhibits probably are those in which the young people who are taking advantage of the technical and other educational institutions attached to the palace compete for distinction. In the exhibition an interesting object-lesson—of which it is said we shall see a good deal in the streets of London some of these days—is to be found just within the entrance; it is a tall, handsome column, fluted in green and gold, shown by the company or syndicate who propose to bring within the reach of wayfarers hot water and the materials for having a cup of hot coffee or tea in the open air. There are now 2500 students connected with the evening classes of the technical college attached to the palace, and many of these have sent models and fancy handicraft, some of these being of high quality. The 400 boys who are training for engineers and builders in the day schools have also contributed their quota. A boot-maker sends, not, as one would suppose, some masterly *chef d'œuvre* of leather work, but a cabinet-making production in the shape of a cathedral with a chiming clock. Young men and young women furnish designs for wall papers, embroidery, &c., and amongst the wood carvings there is nothing better than Perrin's wreath of flowers. A portable steam-engine in full working order, wrought by a blacksmith apprentice, is capital; and there is another notable bookbinding exhibit sent by a student. There are many specimens of hammered iron and copper. Amongst the exhibits sent by firms must be included the models from the Thames Iron Works. In the Doulton section, Tinnmouth's "Song of Miriam" must be a stimulus to the young artisans of the East End, and promise of the success to which they may attain in real Art.

A RUMOUR, that was a few months ago spread very persistently, concerning the probable re-opening of the Grosvenor Gallery as an Art exhibition, has lately been revived. In some ways it would be an advantage if the rumour proved to be well-founded, for certainly there are no rooms in London so well adapted for the display of works of Art; but, on the other hand, it is questionable whether there are not already galleries enough existing to accommodate all the current Art work that is worth setting before the public. It would be useless to open another show unless it can be filled with good pictures, and at present it is a little difficult to see where they are to come from.

EARLY next year an exhibition illustrating British Art will be held in the rooms of the Society for the Promotion of the Fine Arts, at St. Petersburg. About four hundred works in oil and water-colour will, it is expected, be brought together, and all the more prominent artists in this country will be represented. The range of the exhibition is to be as wide as possible, so as to show the varieties of expression in the different schools and groups. This British collection will be followed about three months later by a similar show dealing with Italian Art.

AN ingenious invention is the Halford Aerial Railway, by which it is claimed the need for the steam locomotive is superseded. It is of the overhead railway type, the lines being

raised at a certain height from the ground and the cars suspended on pivots attached to a bogie, which runs along the metals. The rails can be made up of sections of any length—from 70 to 100 yards would be the measurement on a full-sized railway—and the ends of each span are successively raised and lowered by hydraulic power, the top portion of each of the steel supports of the line acting as pistons. By this means a succession of gradients is obtained, and so the carriages are run along at a high rate, a working model, exhibited by Mr. Halford, gaining impetus as it rushes down one gradient after another at an immense speed. Immediately a section of the line is passed it resumes the level position. The inventor claims that a rate of 200 miles an hour could be obtained.

At a recent meeting of the St. Olave's (Southwark) Board of Works a discussion arose out of a recommendation of the Works and General Committee that Bermondsey Street be paved with hard wood. The recommendation was opposed, and the Surveyor, in reply to a question, said that hard wood had not been put down in any street for but very few years. But in Euston Road, where the traffic was much greater than in Bermondsey Street, this particular paving wore at the rate of one-fifth of an inch per annum. That being so, it would certainly last for more than seven years. The watering of such pavements was done more frequently, and consequently was more costly. Dr. Bond expressed his opinion that hard wood was more sanitary than soft wood. Mr. Hartley conceived that wood paving should be laid down as much as possible, in order to render the streets more convenient for business. Eventually, however, an amendment to relay the street with granite sets was carried by a majority of five votes.

THE presentation of prizes to the successful competitors at the twenty-eighth annual exhibition of turning in wood and pottery, organised by the Turners' Company, took place in the Egyptian Hall of the Mansion House.—Mr. J. T. C. Winkfield, who presided, said that although it was a matter of regret that they had not a more numerous collection, still it was a source of congratulation, because it arose from the fact that so much more attention had lately been drawn to this beautiful art that many workmen who were desirous of competing had not the time to do so. The Company did not, of course, take any credit for that revival, yet it thought that these annual exhibitions had tended to cultivate this taste in the public.—Mr. George Budd (one of the judges in wood), in speaking of the technical merits of the specimens, referred particularly to the excellent exhibits sent in by apprentices.—Among the principal prize-winners were Mr. F. Powers (Andover) and Mr. S. Stocks (London), who, in addition to a silver medal, had each conferred on them the freedom of the Turners' Company.

PROFESSOR JOHN MILNE writes from Shidehill House, Newport, Isle of Wight, pointing out that amongst the papers recently received from India is the official report from the secretary to the Chief Commissioner of Assam on the earthquake of June 12th last, which resulted in the loss of 1542 lives and the destruction of an enormous quantity of property. The cost of repairing damages in the Public Works Department a one is estimated at more than 35 lakhs of rupees, or, to put it moderately, over one quarter of a million pounds sterling. These figures do not include the cost of damage to local communications chargeable to municipalities and local boards or departmental expenditure not borne by the Public Works Department. In the circumstances, the Chief Commissioner is applying for a grant from Imperial revenues to assist the administration to recover from the effects of the earthquake. "Here," says Professor Milne, "we have a danger threatening life and capital which can only be avoided by the acceleration of engineering operations. With regard to the proposals that the various headquarters of the Assam administration shall be shifted to more

favourable sites, the interference which such a step would cause to public and private interests makes it desirable that the effects of earthquakes in the future should be met, not by escape to localities where movements might be less, but by changes in the methods of construction. During late years Japan has suffered from earthquake movements probably more severe in the ratio of nearly five to three than that which in June last created so much destruction in Assam. Profiting by experience and guided by experiment, Japanese engineers and their European colleagues have gradually departed from stereotype methods of construction, with the result that structures of the new type, whether they are ordinary dwellings or other works, have so far remained standing, whilst what is old is slowly disappearing. The facts that the Japanese Government annually votes from £1000 to £5000 to assist a committee in investigations which may result in modifying earthquake effects, has a bureau controlling the seismic survey of its country, and has appointed a professor of seismology at its University (at which all students of engineering listen to some twenty or forty lectures on construction in earthquake countries, and by this time may have read the report of its trained seismologist, Dr. F. Omori, sent to Assam to note anything that might be of benefit to his own country), are strong testimonies that material benefits have already been obtained from the study of earthquakes. When we consider the British capital invested throughout the seismic regions of the world, and the money from time to time expended in the restoration of consular and other buildings, we must surely feel that the sooner we turn attention, if only to that which has already been done to mitigate the effects of earthquakes, the sooner will the loss of life and property which accompany such disasters be reduced."

THE Society of Arts has just placed a tablet on the house at Hampstead in which Sir Harry Vane formerly resided, bearing the following inscription: "Sir Harry Vane, statesman, lived here. Born 1612. Beheaded 1662." The house is now known as Belmont, and adjoins the Soldiers' Daughters' Home. Both houses originally formed one residence.

THERE is a strong feeling in Russia just now in favour of the development of Art. In order to foster this feeling the Russian Government has arranged to hold exhibitions of some of the best masterpieces of painting in the world. The first exhibition will be one of British Art, and will be held this winter at St. Petersburg. Over 450 works in oil and water colour will be brought together, representing the best known English artists, and illustrating different schools and groups. The second exhibition will deal with Italian Art.

ACCORDING to M. Felix Dubois in his recent work on Timbuctoo, that mysterious city to which the late Joseph Thomson meditated a visit, is far less interesting than Jene, from which the word Guinea comes. This archaic town dates from the seventh century, and was built in the Egyptian style by Songhis, who emigrated from Egypt 1200 years ago, and who still preserve the traces of their Nilotic origin.

IN the course of the past summer, in consequence of a careful sifting of certain traditions found among the residents on the Ruthin side of the Hirathog Mountains, Mr. R. O. Jones, of Ruthin, has carried out a search over this almost uninhabited region for archaeological remains, and has succeeded in finding nine stone circles that were hitherto unknown. Some of the circles are perfect, and some imperfect, the latter having probably been deprived of stone for building purposes. The outside of each circle is composed of large stones, and, in those circles that have not been tampered with, the outer stones are twelve in number. Professor Rhys, of Oxford, holds that the remains are far more ancient than the Ogam inscribed stone found in the same region, and now at Pool Park, Ruthin.

MODERN SANITATION.

By H. A. SAUL.

(Continued from page 215.)

IV.

IN many districts around London and elsewhere which do not enjoy the advantage of a connection for their main sewers with a large scheme such as that which has its termination at Barking or Cossness upon the Thames, other methods of disposal have to be resorted to. In many places the house drains are connected to cess-pools, and in others to a sewer which discharges directly into a stream or river with little or no previous purifying treatment. Each of these systems possesses serious disadvantages, such as the contamination of drinking water and the fouling and pollution of rivers; disadvantages which increase with the number of the population.

Mainly to the increase of the population became due the necessity of providing other means for dealing with the refuse of the house, to which end numerous small sewage works have sprung up for the reception and treatment of the sewage from the several localities in which they are situated. This treatment consists of a separation of the solid matter from the liquid, deodorising and compressing the former for disposal upon land or other purposes, and purifying the latter so that it may be conveyed without detriment to a convenient stream or river. Obviously the less liquid which is allowed to enter the sewage works, the more easy becomes the task of treatment, and the greater the economy in the size of settling tanks and working expenses generally. Chiefly for this reason the system was devised of separate drains for surface water, that the same might be directly conveyed without the admixture of soil to a point of discharge. This is the dual system, to which reference was made in a former article. The system has not been adopted merely in isolated localities, but in many new suburban districts which have their drains connected with the main sewage of London or other towns.

The accompanying plan, No. 3, is that of the ground floor of a small semi-detached villa, showing the drains laid to comply with the method above described. The soil drain embodies all the principles which have been described in the previous articles; in this

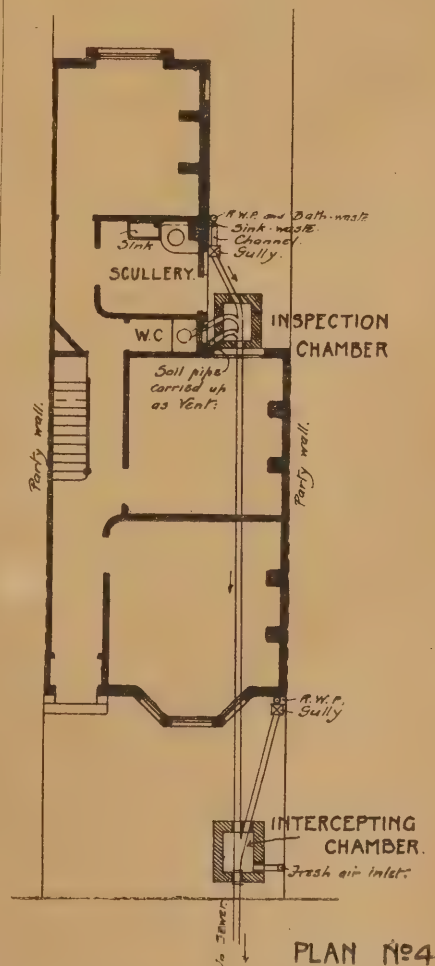

instance the w.c.'s have been planned at the head of the drain with a consequent efficiency and economy in ventilation, the sole vent-shaft being formed by continuing the soil-pipe upward. The surface water drain is similar in its construction to the soil drain, with one important exception, viz.:—that its course through the intercepting chamber is not by means of open channels, but by closed pipes, the object being to prevent sewage smell from finding its way into the drain. For purposes of cleaning or inspection one of the pipes within the chamber has a moveable portion which fits into a socket and is sealed in a similar manner to the cleaning cap of the sewer gas interceptor. This is known as a capped pipe, and is shown in detail by Fig 1. Where the drain passes through the chamber towards the road, an interceptor is fixed similar to that for the soil drain. Advantage has been taken of the nearness of the upper end of the drain to the turning chamber to continue the same into the latter, where it terminates with a socket into which is fixed a plug, similar to that used in connection with the cleaning arm of the sewer gas interceptor illustrated and described on page 191 in Article II.; this is for inspection and cleaning purposes. It is not necessary to provide ventilation for the surface water drain of so small a house as that under consideration, although it would be advisable to do so with a large scheme in which there were drains of considerable length.

An arrangement has been shown upon the plan in connection with the wastes from the bath and the sink, which differs from that which has been described in the former articles. This has been done to comply with the bye-laws which obtain in some districts, and which have been compiled at a more recent date than those which would render permissible the method already illustrated. The following is an extract from the recently published set of bye-laws:—"Any person erecting a new building shall cause the waste-pipe from every bath, sink (not being a slop sink constructed or adapted to be used for receiving any solid or liquid filth) or lavatory, the overflow pipe from any cistern and from every safe, under any bath or water closet, and every pipe in such building for carrying off waste water, to be taken through an external wall of such building, and to discharge in the open air over a channel leading to a trapped gully grating at least eighteen inches distant."

The idea of this arrangement is that eighteen inches of air are made to intervene, in which may become dispersed any smell from the trapped gully, which might otherwise pass up the pipe and so gain access to the interior of the house. Fig. 2 illustrates a channel and gully, and also a connecting piece for the bath and sink wastes. The channel is shown covered by a grating, although it is not necessary to provide this to comply strictly with the bye-laws. The waste-pipe connections can be obtained of various forms, with sockets of different sizes to suit almost any combination of pipes.

The descriptions of drainage have so far only

applied to houses having available ground at the side in which the pipes could be laid without passing under the building. Plan No. 4 shows a simple system to a small villa forming one of the terrace in which the drain has to pass beneath the house before it can be connected to the sewer. The bye-laws arrange for drains of this description as follows:—"No drain shall be constructed so as to pass under any building except in any case where any other mode of construction may be impractic-

PLAN No. 4.

cable, and in that case such drain shall be so laid in the ground that there shall be a distance equal at the least to the full diameter thereof between the top of such ground under such building. Such drain shall also be laid on a solid foundation in a direct line for the whole distance beneath such building, and be completely imbedded in, and covered with good and solid concrete, at least six inches thick all round.

FIG. 1.

VENTILATION OF THE METROPOLITAN RAILWAY TUNNELS.

THE report of the committee appointed by the Board of Trade to inquire into the system of ventilation of tunnels on the Metropolitan Railway, together with the proceedings of the committee and the minutes of evidence, has been issued as a Blue-book. The committee, which was appointed by the Board of Trade on February 2nd last, consisted of Sir F. Marindin (chairman), Earl Russell, Sir Douglas Galton, Sir C. Scotter, and Dr. J. S. Haldane; and their duty was "to inquire into the existing system of ventilation of tunnels on the Metropolitan Railway, and report whether any, and, if so, what steps can be taken to add to its efficiency in the interest of the public." The committee points out that it was originally intended to work the traffic on the Metropolitan Railway with hot-water locomotives, and, therefore, no provision was made for ventilation; but the experiments made before the line was opened of this mode of working proved a failure, and the idea was abandoned. The Acts authorising the construction of the railway contained no clauses dealing with ventilation, and no restrictions are to be found as to the power to be used in working the traffic, these questions not having been raised before the committees in Parliament. Ordinary locomotives fitted with condensers were adopted, and in the first instance the fuel used was coke, but subsequently it was found necessary to resort to coal, which is the fuel now used. Remedial measures in the shape of openings and fans had not proved effective. The witnesses who gave evidence concurred in alleging that the portion of the railway which suffered most from want of ventilation at the present time is that between Edgware Road and King's Cross. The committee had mainly directed its attention to this portion, but

evidence was also taken as to the defective ventilation of the line from Baker Street to Finchley Road. As showing how the air in the tunnels is affected by the traffic, it is mentioned that there are at present 528 passenger trains and 14 goods trains in about 19 hours between Edgware Road and King's Cross. Each locomotive consumes 30wt. of coal and evaporates 330 gallons of water per hour. During the busiest times of the day there are 19 trains running each way in the hour. The engines would consume on the portion of the line between Baker Street and King's Cross 150wt. of coal, and would evaporate 1650 gallons of water in that time. Attention is drawn to the amount of carbonic acid gas in the tunnel air, and to other impurities which arise from the emission of steam, and from the fuel consumed by the engines. After considering the suggested remedies of removing the impure air by fans placed midway between the stations, and the provision of additional openings, the creation of which were objected to by the local authorities on the grounds of public health and depreciation of property, the committee concludes by stating its conviction that pure air can be best obtained with certainty in these tunnels by means of electric working. The conclusions are:—

1. That by far the most satisfactory mode of dealing with the ventilation of the Metropolitan tunnels would be by the adoption of electric traction.
2. That it would be practicable to ventilate the tunnels satisfactorily by means of fans placed at intermediate points between the stations, but that the cost of doing so would be considerable.
3. That, failing this, the ventilation, especially at the stations, would be sensibly improved by the provision of the openings proposed by the Metropolitan Bill of last year,

but that it could not be rendered satisfactory unless by a large increase in the number of openings therein proposed and a consequent large addition to the expense.

4. That, in view of the probable adoption of electric traction in the near future, it can hardly be expected that the Company should incur the heavy expense of at once providing artificial ventilation, and that, if it did, it would probably defer the more satisfactory solution of the question.

5. Therefore, as a temporary measure, the committee is prepared to recommend that the construction of the proposed additional openings, which would be found useful, even when the line is worked electrically, should be allowed, but only upon the condition that, unless electric traction be adopted, or some satisfactory artificial ventilation be introduced within three years after the passing of the Act authorising these openings, it shall be made incumbent upon the Company to close them if called upon to do so by some competent authority to be named by Parliament.

THE RECONSTRUCTION OF BOMBAY.

A SANITARY enterprise on a vast scale is announced from Bombay. The Government has laid before the Municipality a scheme for expending 50 million rupees on bringing up the house accommodation of the city to the standards demanded by the laws of health. This sum is apart from the outlay already devoted to waterworks and drainage—an expenditure enormous in the past and still going on to an extent that will exhaust even the liberal powers of borrowing granted by law to the capital of Western India. The Government is aware of this fact, and is preparing to make special provision not only for providing the funds, but also for the conduct of the new work. As Baron Haussmann reconstructed Paris from the point of view of political control, so Lord Sandhurst proposes to reconstruct Bombay from the point of view of sanitary safety. In replying to a deputation of the Bombay Chamber of Commerce last February, his Lordship referred to the urgent need for opening up the congested quarters of the city, for the removal of pestilential dwellings, and for the prevention of overcrowding in the future. Three-quarters of the population of the city are said to be crammed together in "chawls" or rookeries, some of them five to seven stories in height, and run up in defiance of every principle of hygiene. Long interior passages, or rather burrows, go from end to end of these buildings on each floor, giving access to the rooms, "for the most part

SMALL AND WHOLLY UNVENTILATED,"

in each one of which a whole family may live or die. The passages are quite dark, except where they open out on a gully, which serves as a sewage drain. Often they have no opening at either end, and the rooms may or may not have little windows. From five hundred to a thousand persons are sometimes squeezed into one of these pestiferous rabbit-warrens—a prey to infection themselves and a standing danger to the health of the city. We condense the above description from an account published at the beginning of this month. The truth is that the population of Bombay has rapidly outgrown the accommodation existing for it, and the problem before the Government is how to provide decent house-

room for nearly half-a-million of people living as no human beings should live. Lord Sandhurst's plan, whatever may be its financial results, is, says the Times, conceived on a scale commensurate with the evil to be dealt with. It first provides for opening out crowded localities by the construction of new streets, and for the creating of new house areas by levelling up low-lying localities, and by reclaiming considerable tracts from the tidal waters. Having thus secured new space, it next provides for covering it with tenements, to be let at comparatively low rents, and for improving the old unhealthy rabbit-warren in which 75 per cent. of the population is said to be now dwelling. More space and more air are the two main objects which it keeps constantly in view; and it has the merit of providing beforehand for the displacement of poorer inhabitants which any attempt to deal with their overcrowded barracks must at once involve. Fortunately there are tracts in and immediately around Bombay which admit of being utilised for the purpose. These tracts, some of them filthy swamps within tidal limits of the sea, have long been a source of danger to the health of the city. Lord Sandhurst proposes, among other works, to convert these

LOW-LYING HOT-BEDS OF DISEASE

into well raised areas for human habitation. Of the fifty million rupees which the scheme is estimated to cost, rather more than one-half will be devoted to cutting new streets through congested districts of the town, somewhat less than a third to reclamations and levelling, and the remainder to erecting tenements for the poor. The figures provisionally accepted by the Bombay Government in its resolution of September 29th are as follows:—

New streets opening out	Rs.
crowded localities	2,70,00,000
Reclamations	1,25,00,000
Chawls for the poor	83,00,000
Levelling and laying out	
vacant lands	17,00,000

Total Rs.4,95,00,000

The expenditure of this large sum and the construction of the works might seem to fall to the Municipality of Bombay. But Lord Sandhurst, while acknowledging the good work done by that Corporation, sets forth weighty reasons which render it expedient that the present scheme should be carried out by a special machinery of its own. It may be questioned whether such a task comes within the range of duties contemplated by the Bombay Municipal Act. It cannot be questioned that its cost lies beyond the present financial resources of the Bombay Municipality, already pledged to sanitary works almost up to the extent of its borrowing powers. The plague is straining, and will continue for some time to strain, the administrative energies of the Bombay Municipality to the utmost. Lord Sandhurst believes that it would be impolitic and unfair at this juncture to lay upon it the burden of so vast an additional task demanding immediate action, and involving an amount of detailed supervision which would more than double its executive work. All this, and more to the

same purpose, his Excellency says in courteous words and in a conciliatory spirit:—The Governor in Council fully recognises the success of municipal administration in Bombay, as exemplified, for instance, by the

MAGNIFICENT WATER-SUPPLY WORKS,

which constitute an achievement of which any city might be proud; but he is of opinion that a scheme of the character now in contemplation, requiring persistent and long-sustained efforts on systematic lines, involving so many varied purposes with the prospect of an almost infinite number of questions of detail, both in management and execution, and in which, moreover, large proprietary interest of Government will be involved, is essentially one that should be intrusted to a small administrative body, with special powers to raise funds, acquire property, and execute the necessary works. Such considerations receive additional weight from the comments of the Bombay press on the proposal. The head of a banking firm, well acquainted with municipal affairs, thus sums up his practical view of the case:—"It is well known that the landlord influence upon the Corporation is predominant, and hence it is altogether impossible for that body to carry out the scheme on broad and proper principles. This being so, some distinct corporate body, such as that now proposed by Government, is absolutely needed."

Lord Sandhurst desires to create a Board of Trustees for the purpose on the general lines which have been found to work so well in the case of the Bombay Port Trust. The Municipal Corporation will be strongly represented on the Board, but care will be taken to also secure the fair representation alike of the landed proprietors, of the general body of the citizens, and of the Government, which will itself have a very large stake in the enterprise. The idea of such a Board is not a new one, and the City of Glasgow Improvement Trust affords an example of a body constituted for similar purposes, and most successful as to its results. One of the leading Bombay papers in discussing this precedent makes the following remarkable statement, which we reproduce without pausing to verify:—"The City of Glasgow Improvement Trust, created some thirty years since, having expended three millions sterling, transformed Glasgow into a model city, and has been able to reduce the original demand of sixpence in the pound of the municipal assessment to one farthing in the pound, the revenue from the improvements paying nearly the whole cost of the civil administration." The Bombay Improvement Trust will be enabled to raise its capital at the low rate of interest which a Government enterprise in India can obtain. It will also start with

A LARGE AREA OF GOVERNMENT LAND,

transferred for the purposes of the scheme. The present value of these Government lands, and of their reclamation rights, is estimated at over 9½ million rupees, together with the municipal lands, valued at nearly three million rupees, making a total of 12½ millions of rupees worth of land rendered available for the objects in view. The Government will, in fact, make over almost the whole of its landed property in Bombay to the Improvement Trust for the

benefit of the citizens at a low rate of interest, calculated upon present values. During the first ten years the Government will charge nothing. "The Trust shall have the rents from the reclaimed areas for the first twenty years, and afterwards subject to a small charge on the market value, less the cost of reclamation." The capital will be raised gradually, as required. The Government estimates that the scheme will not at any time involve an addition to the municipal rates of more than 2 per cent. on the assessable value of properties, and it contains possibilities of becoming a source of financial strength in the future. The project must be primarily regarded, however, not from the point of view of contingent profits as a speculation, but with reference to immediate benefits which it will render to a great city that has outgrown its house-room. Among those benefits will be, not only more adequate accommodation for the overcrowded poor, but also new areas for the European and well-to-do native inhabitants, who at present pay fancy rents for the sites available for their dwellings.

Surveying and Sanitary Notes.

SURVEYS are being prepared for the construction of a deep-level electric railway connecting the London, Brighton, and South Coast main lines on the south of London with Euston, St. Pancras, and King's Cross. The proposed line will pass through the heart of the West End, and will have a station in the Strand, close to the great hotels and the theatres.

THE Town Council of Luton recently adopted a £40,000 scheme for draining and sewerage the town. In consequence of the wide difference in the amounts of the tenders, the contractor to whom the work was given has withdrawn, and the Corporation has now decided to undertake the carrying out of the scheme under the Council's own surveyor. This will mean regular employment for a large number of men for about three years, and already sixty hands have been put on. In consequence of the rapid growth of the town many improvements have been necessary during the last few years.

THE blocks of pulverised and compressed trap rock with an admixture of limestone and bitumen, which are being tested as road paving in the neighbourhood of Hyde Park, are said to possess an advantage over asphalt, as being non-slippery in wet weather, and over wood, as being impermeable. It is not for lack of experiments that London has not yet discovered a perfect paving material. Wood was hailed with delight on account of the relief of noise which it procured, but it leaves something to be desired on several accounts, not the least of which is the frequency with which wood pavements need to be "up."

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Nov. 6	Birmingham—Cottages and Stabling	Public Works Committee	City Surveyor's Office, Council House, Birmingham.
" 6	Fermoy, Ireland—Villa Residence		J. F. M'Mullen, 30, South-mall, Cork.
" 6	Haswell—School Alterations	School Board	R. Hogg, Fatten Pasture, Murton, via Sunderland.
" 6	Morecambe—Police Station, &c.	Standing Joint Committee	H. Littler, 21, Pitt-street, Preston.
" 6	Pontypridd—Additions to Hotel	D. John and Co., Ltd.	A. O. Evans, Architect, Pontypridd.
" 6	Swinton, near Rotherham—Rebuilding Church		E. J. Hubbard, Architect, Moorgate-street, Rotherham.

THE ADVANCEMENT OF ARCHITECTURE.*

BY PROF. G. AITCHISON, A.R.A.

WHEN I had the honour of addressing you last year, I chose a subject with which I felt sure you would all agree, as it was the recounting of some of the architectural triumphs of the past, and the pointing out of some of the services Architecture has done for those nations where it flourished. These services include the usefulness of the monuments at the time they were built, the adorning of the country, and the keeping of a record of that nation's greatness, of its peculiar characteristics, and of its position in civilisation. I thought that the first utterances of a new president should be as free as possible from controversial matter; but, after a year of office, the president becomes conversant with the wants and possibilities of the Society. I now propose that we should consider how the Institute can, with a reasonable hope of success, improve the Art it was specially created to cherish and advance. The

UNRAVELLING OF THE GREAT PROBLEMS

of humanity and the extraction of the lessons they teach are beset with difficulties, and some of these difficulties are apparently insuperable on account of our ignorance of the factors. Sometimes the glimmerings of light that the most perspicacious can see turn out to be not those of the dawn, but of mere will-o'-the-wisps, as in the case of Machiavelli's works. Machiavelli saw exactly what men did, and was not led astray by what they ought to do, and in the problems he set, he saw the solution wanted, but, misled by the ruthlessness of Nature, he overlooked the supreme importance of how the end was attained; so that the old adage "Let justice be done though everything perish" is a more useful maxim for mankind to follow than to attain its object by wickedness. We cannot suppose that among the two parties who alternately govern us, and help to mould our minds, to direct our aims, and to modify our desires, there are not on both sides upright and devoted men, whose views are as the poles asunder; and it is only by long experience that the value of the measures carried can be judged of. At the time of the discussion of such measures the partisans of the scheme are as sure of its excellent results as their opponents are of its pernicious effects, and as the clashing of the opposing views causes heated, angry, and acrimonious debates, so I fear that

SUGGESTIONS FOR IMPROVEMENT

may have the same effect amongst us. In considering Architecture, as in considering every other transcendental pursuit, we must take the existence of two things into account—namely, the set of the public mind and the occurrence of genius, and though we most urgently want genius in every branch of skill and knowledge, we have not the faintest notion of the causes of its production. The utmost we can do is to offer it ample opportunities of learning what it wants to learn, and to bestow our thanks and admiration upon its possessor and his works. The other cause of excellence is the set of the public mind in a certain direction; but why it sets in that direction is at present unfathomable, though we may roughly indicate that its set is always towards those pursuits that promise power, wealth, and delight. We may, however, say with certainty that in this age it does not set in the direction of Architecture. If the genius of all the great architects that ever lived were combined in one, and that one had the chance of showing it, the Architecture that he would produce would have little or no effect on the public, for the public now gets more, in that direction, than it either desires or deserves almost for nothing, and is perfectly ungrateful. The set of the public mind is so important a factor that we can hardly over-estimate its importance. Men whose turn of mind is in the line of that of the public generally decry

all attempts at systematic teaching, and proclaim that all schools and universities are

MERE SHODDY-MAKING FACTORIES

that turn out a colourable imitation from waste. When in the past there has been a sudden demand by a city or a nation for some kind of knowledge or skill of which there was a deficient supply, the head of that nation or city had no better remedy to offer than the creation of schools, academies, and universities, where the requisite knowledge and skill should be taught or tested, and where it was hoped they might be learned. This was the method adopted by Constantine the Great when he chose Byzantium for the capital of the Roman Empire, and caused to be built there copies of the Senators' houses in Rome, and of their villas in other parts of Italy. We know that in his time the Art of Sculpture had so declined that the statues and bas reliefs had to be taken from Trajan's Forum to form the adornments of his own triumphal arch, and that the sense of propriety had so decayed that there was no outcry against such folly; and though there was then a large influx of architects and skilled workmen into Byzantium, the work was so hastily and so unskilfully done that eighty domes are said to have fallen during his lifetime, and many buildings had to be pulled down in the time of his successors. So apparent was the

WANT OF COMPETENT ARCHITECTS

and skilled workmen, that he offered a premium to those who would have their sons brought up as architects, and to skilled workmen who would bring up their sons to their own trades. With this object he started schools in Italy and North Africa. May we not say that Santa Sophia, one of the masterpieces of the world, was the outcome of this teaching? After the irruption of the barbarians in the West there was a great want of both architects and skilled workmen, and the ecclesiastical authorities endeavoured to supply that want by founding schools in their abbeys and monasteries. Again, at the time of the Saracen irruption there was a dearth of architects and skilled workmen, for these energetic savages came at once from poverty into fabulous wealth, and wanted mosques for their new religion and palaces for their Kalifs, Sultans, and great men; and this want was tried to be met by schools and universities connected with the mosques; and there was again the same want in the days of Charlemagne, and to meet these wants the same methods were adopted. I fancy that all the systems but one offered teaching to all who came, and, I presume, who showed some aptitude; but Constantine, who was certainly an able man, only offered his

PREMIUMS FOR LEARNING ARCHITECTURE

to young men of eighteen years of age who had received a liberal education—whatever that meant then or may mean now. Looking at the enormous extent of the knowledge required by an architect, and the almost antagonistic powers of mind required, would it not be better to confine architectural teaching to Architecture? As Architecture is pre-eminently a constructive Art, construction should certainly be its foundation, the very last thing that would be thought of now, for the æsthetic architect would leave that to the builder and the engineer. It seems ludicrous not to insist on an architect who is to build, having such knowledge of statics as to know the proper method of resisting the force of wind, of water, and of earth, and the thrusts of arches, vaults, and domes. Statics would give us too important lessons in æsthetics, for it gives us the proper proportions of each part of a building when we know the height, the weight to be carried, and the strength of the material to be used. When these particulars are known and provided for, we may roughly say that we have only to accentuate the important part by mouldings, or have them adorned by the sculptor, to make it into Architecture. The literary, goldsmithing, painting, and modelling architects of the Renaissance left us one pernicious legacy, for their aim was to imitate Roman Architecture, and from their teaching the Gothic Revivalists have wanted to imitate Gothic, and the Greek

Revivalists have wanted to imitate Greek, though the Italian Renaissance architects gave grace and artistic perfection to their Roman models. This procedure of imitating the construction and æsthetic expression of a Pagan people who flourished 1200 years before the Renaissance seems to be a mistaken one, for Architecture is a progressive Art, not only in the scientific part of construction, in the increase of material wants and the

INTRODUCTION OF NEW MATERIALS,

but also in the æsthetic part; for no two successive generations like exactly the same forms, nor are the emotions that should be raised exactly alike. You certainly should not ignore the advances made in the Architecture of the immediate past. Between the Pagans of Ancient Rome and the Renaissance, there had been Christian Roman Architecture, the Byzantine, when the dome took so prominent a part; there had been Romanesque and Saracen Architecture; there had been Gothic which abandoned the opposing of inert mass to thrusts and used counterpoise, and showed a constructive skill never equalled till this age of iron; Gothic, too, had tried to express in its churches its ideals of Knighthood and of Roman Catholic Christianity. It was certainly not wise to ignore former advances in construction, and it was hardly possible to go back to pure Roman Paganism, however hard the Renaissance men tried. If we want to advance we must follow the example of the medievals; we must study deeply, observe accurately, reason logically, and be never deterred by failure, and endeavour to express the leading character of our time, which, I fancy, is the getting an insight into Nature's laws and applying them to our own wants. We must, too, endeavour to discover what in the heavens above, the earth beneath, or the waters under the earth we and our employers love to see embodied in our works, and how that embodiment should be expressed. In England we have artificially divided the constant increase of skill and knowledge, and

THE FLUCTUATION IN TASTE

of the Gothic architects, into styles which we call "Early English," "Geometric," "Decorated," and "Perpendicular." I want you to observe that these so-called styles were gradual developments. The first Gothic architects developed the mouldings of the Romanesque; the grouping of two or more lancet windows under an arch suggested a hole in the spandrel afterwards cusped with the new Saracen feature, and so on; and as skill increased and taste decayed, the tracery of the enormous perpendicular window grew mechanical and ugly. It is only by increase of æsthetic and constructive knowledge and the development of necessary features that any characteristic features of our own can be stamped on our Architecture. Anyone who can appreciate the beauty of mouldings, and has seen

GREEK ARCHITECTURE AT ATHENS,

cannot fail to observe how absolutely ineffective these mouldings are in the misty atmosphere of London, particularly when there is no sunshine. The only other architects who understood the art of moulding were those of the Middle Ages, after what we call Gothic was developed; their mouldings are perfectly effective in misty weather, but are too coarse and hard when there is full sunshine, while they are at all times wanting in grace. Yet I may say that the art of moulding is as much neglected now as the science of statics. No one can give genius, nor does it seem in one man's power to turn the desires of mankind in the direction he desires. You can, however, try to drive away from the Profession, by a thorough examination, all those who do not love Architecture; this love does not always ensure the possession of genius, but it mostly does. Having got the proper sort of men, you can see that they have that necessary knowledge and skill that would enable them to use the divine spark properly if they have it. Ben Johnson repeats Horace's adage that "the poet is born and not made;" but he adds, for all that, a poet wants a good deal of making, and it is the same in all the fine Arts.

(To be continued.)

* The President of the Royal Institute of British Architects' opening address of the session 1897-98, delivered at the first General Meeting, held on Monday night.

FIRE PREVENTION.*

By EDWIN O. SACHS,

Author of "Modern Opera Houses and Theatres."

(Continued from page 269.)

IF the Building Act of to-day defines the thickness of a party wall and its height above the roof, quite independent of the fact of a man giving a party, or lending his house for a drawing-room meeting, having a chemical laboratory in the place, dancing classes, or a school, why should there not be such planning compulsory as to prevent any room over a given size, be it a ballroom or studio, being used without risk to life? Why should not every large drawing-room on the first floor have sufficient exit and staircase accommodation to deal with the maximum number of people who press into that drawing-room? and let the same hold good for every class of structure, if a public house, a school-room, or a chapel. Do we not all know the bazaars held in houses kindly lent by charitable owners? I have a house in mind in Carlton Terrace, where the first-floor drawing-rooms are at times simply packed, and the staircases so crowded that it takes a full half-hour to get from one floor to another. The function was essentially a semi-public character, and as dangerous an one as I can remember. You all know the entertainment in the parish schoolroom, given ostensibly by the school-master to the friends of the pupils. Well, again, don't let us bother too much as to the exact purpose of any gathering, but let us build our larger room so as to allow for assemblies of any description, with

SAFE AND SPEEDY EXIT

in case of need. How are we to assure ourselves that even if any one room or hall fulfils the ordinary requirements of safety, as far as plan and construction are concerned, that the variations in the interior arrangement, in the decoration, &c., do not more than annul what the architect has done? Of course a building, a room, or a temporary structure should be used for what it is designed, and for no other purpose. But in reality we must consider the possible purposes to which a room may be put; in fact, the dangers of any decoration or paraphernalia necessary for the fulfilment of various objects must be considered at the time of construction. A hall which is used as a ballroom, and which is perfectly safe as such, may be a veritable mousetrap when used for theatrical entertainments. A hall designed only for banquets, public dinners, &c., may become dangerous when utilised for bazaars, with all its temporary stalls and side shows. The building must be designed to fulfil conditions of the greatest possible danger. Of course many hold that we cannot limit ourselves to controlling the erection of buildings, but we must seek to obtain control over their employment and the manner in which they are equipped for its different purposes. No doubt it is just the ordinary drawing-room, the ordinary assembly-room, the schoolroom, &c., which is used for so many purposes for which it is never intended, and that there are many dangers incurred on that account. Such control has been attempted in some Continental countries. But I think such control would be very hateful in these freer isles. We would, I am sure, rather build our houses and halls at once in such a manner as to be prepared for all risks, rather than be constantly worried by inspections and the like. What may be good for a Continental country is not suitable for us. We all abominate anything like perpetual grandmotherly interference. Hence, I say, rather let us at once build suitably for all emergencies. If we do that, we need not be constantly worried. Perhaps even improvement of plan and construction at the outset in a new building appears a very serious matter to you, but think, what does it really mean in nine cases out of ten? A few extra doors, and these so hung as to swing outwards; stair-

cases, perhaps somewhat broader, and not of a dangerous hanging type; hand-rails perhaps on both sides; a few safety bolts or latches. Surely this would not even interfere with

A GREAT ART-ARCHITECT'S DESIGN,

his colour scheme or details, and would this not save us endless worries of control over all private and semi-public entertainments? And now comes the question of provisional buildings erected for some specific purpose, such as a bazaar, and often allowed to remain in position for some indefinite period. Again we find nothing has so far been done or decided so as to minimise danger in these structures—in fact the meaning of a temporary structure has scarcely been defined. Is the large tent, built in the garden of a private residence, or on some verandah, a temporary structure or not in the meaning of the Act? and if so, why are such tents erected with impunity for all manner of social functions throughout the London "Season"? To my mind the less temporary structures are encouraged the better, and this, no matter what their character or purpose. But when erected, let the same importance as to planning and watching be accorded to the provisional building as is essential for a permanent structure. Let us also remember the Charity Bazaar Fire, and let us consistently avoid the flimsy and dangerous materials used for its construction. Why, we can even have temporary iron buildings at a very reasonable expense. Planning and watching should be kept strictly in mind. It is likewise not my wish to enter into details on the question of equipment, for here again the diagrams will show everything that is to be condemned. There is so far, I am aware, little or no regulation as regards such equipment of to-day. The matter has, in fact, scarcely ever been discussed, though an all-important one as far as safety of life is concerned. I do not wish to air personal opinions on the subject of equipment, for it would take a long time to explain the possibilities, probabilities, &c., of the question. If I may be allowed to call attention to any one thing, it is, however, to the fact that whatever the architect may do in any class of building used for entertainment, his efforts can so easily be annulled by flimsy decorations, appointments, equipment, &c.; it is just this so-called decoration, combined with carelessness on the part of the individual, that is the actual cause of most fires. Apart from facilitating the escape of the individual, the architect's efforts are to a great extent limited, as far as the actual fire is concerned; first to avoiding the possibility of an outbreak occurring in connection with the structure proper, and secondly, seeing that should an outbreak occur his structure does not facilitate its spread. The architect cannot prevent a drawing-room or a schoolroom being decorated with bunting, liberty silk, or paper rosettes;

and, as I have said, control in these matters would probably not be advisable in England. He cannot prevent the smoker "lighting up" at his smoking concert, or prevent the use of open lights, and official interference in such matters would be unacceptable to the average Englishman. We can, no doubt, prevent many dangers in the usage of buildings erected for public entertainments. We could and should prohibit the wood stage of the theatre; we can prevent muslin hangings being used in the auditorium, and allow smoking only in specified rooms. But such restrictions would be intolerable and extreme if applied to rooms used for private and semi-public gatherings. It would not be practicable. Thus again, remember we have to deal with certain well-known possibilities of fire with certain given facts, and for these facts you have to provide. The actual misuse of those liberty silks, open lights, muslin, paper roses, in our private and semi-public entertainments, rests entirely with the good sense of the general public. Until the general public boycott them, you will have to take them into account when you are at your drawing-board or superintending your jobs. And now, what is to be the remedy for the present state of affairs regarding safety of life at entertainments and gatherings of different

descriptions? The first and principal remedy, to my mind, as I have already indicated, lies in your hands, as representatives of the architectural profession. It will be the architect mainly to whom we shall have to look for safety—we have to rely on the spirit with which he designs his structure, no matter what the regulations may be. At present, I am afraid safety of life is about the last thing that the designer thinks of. Safe-planning and fire-resisting construction will have to become subjects in the student's curriculum, and the practitioner of to-day must have his attention called to these matters. Secondly, we must depend largely for

IMPROVED PROTECTION

on the general public, who will, to a great extent, sooner or later, have to take upon themselves the rôle of being their own guardians. At present there is not the slightest interest in this country in the question of protection from fire, whether it be in connection with our entertainments or with the fire losses generally. That interest will have to be awakened. The public will have to call for protection, and will have to give protection from fire the same amount of attention which is accorded to safety in travelling, safety of health through sanitation, and safety from social disturbance through police supervision. Whilst the architects on the one hand will be acting as experts and giving the British public safer buildings, that British public will in time see that these buildings are employed for what they were originally intended, and that no unsuitable decoration or equipment is permitted. Such gross mistakes as are now being constantly made will, if I may say so, some day be instinctively avoided. Thirdly, architects and public opinion will have to be supported, their hands strengthened or governed as the case may be, by further legislation, giving the necessary powers to those in authority to intervene when necessary, and laying down the principles that have to be followed; and with new legislation we should also remember that we shall require more officials who will in every way be capable of carrying out its administration, and the execution of any specific code, with tact, knowledge, and sound common sense. Legislation on building matters always requires a certain power of discretion for the officials. We do not want the red-tape automaton so conspicuous in some of the Continental countries. But how are these remedies to be brought about? Of course there is always a considerable literature forthcoming on a subject of this description after every catastrophe. We have had literature enough after former fires, but unfortunately, except for the steps already taken as to theatres and licensed premises both at home and abroad, it has been literature alone. There has been

MUCH WRITING BUT LITTLE ACTION.

It is now time to take action. We do not wish London to be the scene of a calamity similar to that by which Paris has been recently visited. How are we to get the architect in practice to take a little interest in fire protection, not only in its general aspect, but specially in connection with our entertainments? How is the student to be encouraged to take the matter up? How, again, is the general public not only to be interested, but educated? How are our authorities to be assisted in arriving at practical conclusions and regulations, and our officials kept in touch with what is going on in these matters? It is a big question, for I go so far as to say that, in regard to the general public, we should even let the Board School "standard reader" have pretty fables dealing with the dangers of fire, rather than some of the useless stories that appear to-day. Don't think I am proposing anything new. Sweden has long utilised its "standard reader" for impressing matters of importance on the rising generation. We all remember our fables. Surely they would impress on our minds such things as the danger of throwing matches about? I go farther still, and say that the public Press, that great educational factor of to-day, might be induced to give us something more instructive about fires than mere reports of conflagra-

* A Paper entitled "Lessons from the Paris Charity Bazaar Fire" read before the Architectural Association on October 22nd, 1897.

tions, the efforts of our gallant firemen, and the exact number of feet of hose that are taken to a large fire. We might hear more of the origin of fires and the possibilities of prevention. How are we to attain these improvements? Well, to my mind, the right note has been struck at Paris. It has said: "Call together your leading architects and surveyors, your civil and mechanical engineers, your experts in chemical and other sciences. Call together your leading officials, the leading Government and municipal workers, and others seriously and scientifically interested in the technical and economical problems of to-day. Don't forget the leading fire brigade officers nor the owners of warehouses, theatres, and other dangerous property. Combine the many conflicting interests. Don't be afraid of compromise. Avoid onesidedness. Examine what has so far been done at home and elsewhere. Find out what proposals are stowed away in men's minds. Confer. Then act, and act soon. But mind,

NO ONE-SIDEDNESS OR PETTY PREJUDICES.

That is the advice from Paris, where it is being acted upon. Other countries will act on it, too, and I hope Great Britain will be foremost among them. A small start has, in fact, already been made. At the initiative from Paris a small committee has been formed, which is taking up this matter of fire prevention. This is scarcely the place to mention names, but perhaps I may say there are among the members men whom you know and admire. That committee, made up of representatives of the different interests, will soon find a way to help the architect, to see that the general public does not forget the lessons of the Paris fire, and that our legislators have sound independent assistance when required. I hope some of the prominent members of the Association will be among the first to join and help this committee, and thus show that the opposition I first spoke of is not favoured by its leaders of our Profession. It is fire prevention, mind you—preventing fires—that we have most to-day to think of; not putting the fire out when it is there. Let our gallant firemen look after the fire fighting when the fire fiend is actually among us; but let us see that our firemen have as little work to do as possible, and that they are not handicapped to the extent they are at present.—Mr. Richard Roberts, Vice-Chairman of the Theatres Committee of the London County Council, said the County Council, as they all knew, had done considerable work in the direction of fire prevention, and its members had been very ably advised and guided by its permanent officials. Mr. Blashill, the superintending architect, had, in this sense done much. The speaker believed there was a good deal in the suggestion put forward in Mr. Sachs' paper—that with regard to watching and planning; the Council already saw that theatres were properly provided with the necessary number of exits, also that there was a proper site, but there should be

MORE ATTENTION GIVEN TO PLANNING,

and there should be continuous watching. But if our architects of to-day were not alive to risks of fire, how could they expect the general public to be more careful? If they, with all their knowledge and learning as to materials, constantly ran risks, and let others run risks, they must expect the general public would also do so. Speaking again of the County Council officials, we owed a great deal to Mr. Blashill and his assistants, because they continue to press this important point of danger from fire and danger from panic. The officials made their requisitions to a good and high standard. If they were minimised they were not minimised by the action of the officials; it was by the committee. It was the layman who tried to make the requirements for safety less onerous to the property holder. The speaker considered the dangers of temporary structures particularly serious. He was very sorry to see any application for temporary building in London, and the generally accepted practice of the Building Act Committee was never to grant permission for a temporary building except for a

school or religious or philanthropic purpose. The committee did not now grant permission for temporary structures for entertainments, and certainly never for trade purposes. All buildings used for entertainments should be permanent and well built, and he thought architects should set their faces as far as they could against temporary buildings of any kind. The new suburban theatres that were springing up all over London were well constructed and their sites were good. He was not going to say anything about their artistic merits. Let them be charitable, and say that their owners spent so much in better sites and improved construction that they had no money for artistic merits. The County Council could not be responsible for the lack of artistic merit, for its duty was to preserve the lives of the public at all costs, and in this it hoped to be always assisted by architects.—Mr. Sidney Gamble, of the London Metropolitan Fire Brigade, speaking of theatre fires and the advisability of having clear and well-planned corridors and staircases, mentioned the Oporto fire, in which case the people had safely left the auditorium, but unfortunately many either lost their way or got blocked on the staircases and corridors, and were crushed or suffocated there. Mention had been made how architects press upon the local authorities to relax their regulations in relation to fire prevention. He must confirm Mr. Sachs' view that architects often tried very hard to get out of the regulations. Mr. Sachs also mentioned, with regard to the Paris fire, that the glass in the roof went very early. Well, unless he had got definite information upon that point, the speaker very much doubted it. He rather thought that the glass, according to that section, would have stood the fire for a very considerable time. Glass would stand for a long time, unless cold water was thrown on it. If the glass had cleared away in good time it would have been a very good thing, for then the smoke would have got away. There was one point that had not been touched upon, and that was, that many buildings were so altered after being first erected that

THEY BECAME VERY DANGEROUS.

That was one of the firemen's great troubles. Many of these alterations were often done without the authorities knowing anything about it.—Major Fox, in continuing the discussion, said the subject of churches, only casually mentioned by Mr. Sachs, was a very serious one. They all recollected the terrible disaster in Santiago. It would be only fair if churches were examined just as well as other public buildings. If they were to go into the gallery of some of our churches, and notice the length of time occupied in clearing the church, looking at the matter in view of what has taken place in the past, they would at once conclude that a great many people must be hurt in case of panic. Touching on a matter of detail, he certainly agreed with Mr. Gamble that the breaking of the glass was not the cause of extra danger. It would have been better if the glass had gone sooner than it did. The great danger, however, in that building, as Mr. Sachs pointed out, was undoubtedly the velum, and when it dropped on the people's head there was really no hope for them.—Mr. Thomas Blashill said he was of opinion that the public did not take any interest in fire precautions at all; in fact, it did not take the slightest interest in fire until the moment it broke out. The managers connected with our

THEATRES AND MUSIC HALLS

were not by any means the most unfriendly as to fire prevention, though financial consideration made them, perhaps, a little cool when talking about danger. The persons of whom the speaker had greater fear were the persons connected with temporary entertainments—clergymen, schoolmasters, or philanthropic persons who wanted to have a provisional structure with a stage or music for a short time only. They were absolutely reckless; they were a source of danger, and must be stringently dealt with. As to theatre construction, he was very pleased to say that, with the experience of ten years, it was to-day somewhat rare to find a theatre proposed with a

thoroughly bad plan; and it was very rarely that one had to use forcible arguments to obtain the improvement of such plans. Now with regard to the Paris fire, he had said frequently, that to the architect and to a really practical man, conversant with the subject of fire protection, the Paris fire conveyed no lesson whatever. The Paris fire was the outcome of the greatest combination of improper reckless proceedings that he had ever met with in the course of his life; and yet that fire would have to be an object lesson to a vast majority of professional men, not to speak of the public. In conclusion Mr. Blashill said: There is one word I should like to have with architects. Young architects here will forgive me if I address my remarks to them. Suppose they come to the offices of my Council and try to over-persuade me to do that which I do not think they ought to be allowed to do; suppose they pursue the matter to the committee, and get the members to think that the requisitions are very hard. In what position would the architect be if it came to an inquest? He would be in

THE POSITION OF THE PROFESSIONAL MAN

who, contrary to advice, had put his approbation upon this scheme. Now, I think it is very unfair for men, who do not intend to take any responsibility themselves, to be perfectly satisfied when they get a council or committee in their favour, and to consider themselves exonerated in case of disaster.—Mr. William Archer, the dramatic critic, said the West End theatres are mostly old theatres placed on more or less inconvenient sites. He hoped the London County Council was looking to the sites as well as to the building of theatres. Undoubtedly, theatres would be set away in holes and corners so long as ground-rent was so great, and there would always be difficulty in acquiring proper exits. No one had any confidence in the emergency exit or extra exit. He saw at almost every theatre "extra exits in case of need," or "emergency doors," but he never saw these doors open, no one uses them, the emergency not having arisen, of course. But he would like to feel that these doors could open in cases of emergency, and it seemed to him that a regulation which might be very well enforced would be that these doors were really open every evening. Of course it was a very happy thing in a way that people were so unimpressible and did not realise the dangers which they ran. Perhaps it would be even better that there should be an occasional loss of life than that they should go about shaking in their shoes because they were afraid of fire, but that was no reason whatever why every possible means should not be taken to prevent the occurrence of fire, and to facilitate the escape of the public in case of fire.—Captain Dyson, of the Windsor Fire Brigade, was the next speaker, and following him came Mr. Lovegrove, who, in proposing a vote of thanks to Mr. Sachs, said, as to places of entertainment, what they could primarily do was to provide proper exits, and he was glad to say that plans now submitted were very much better than those presented some years ago.—Mr. Max Clark, in seconding the vote of thanks to Mr. Sachs, entirely disagreed with him as to the position which he said the architect took up. Then, continued Mr. Clark, Mr. Sachs advocates the view that good planning is to be given preference to fire-resisting construction. To my mind it is, however, of the greatest importance to use everything that it is possible to use of the fire-resisting materials. Remember, nearly all the great fires we speak about have been in

BUILDINGS OF AN INFLAMMABLE NATURE.

Most of the theatres in which we had fatal fires had much timber-work, and such timber in a theatre soon becomes highly inflammable, owing to the heat. Referring again to building materials, I hold that no part of the construction of a theatre in the future, not even the roof, should be of wood, and that only materials should be used which prevent the flame from spreading rapidly. As to details. We have heard some remarks as to glass not breaking so rapidly under heat as some people think. May I ask, then, why the fanlights over our

stages are ordered to be glazed. They are intended to break and let the smoke out. With regard to the velum, are we never to have a velum any more, is it not possible that these sheets so that they will not burn? Because if it is not, the sooner they are removed the better. But I think there are several chemical preparations which would prevent their burning, and I would call your attention to chemical preparations which are so generally neglected. Referring again to public opinion, let us remember we have to-day not only to think of the public mind, but also of the state of the Press mind. I have here a cutting from a leading morning paper, and a typical phrase is, "One of those hideous things known as

IRON CURTAINS

has been dispensed with, as the arrangements for checking fire are perfect and complete." Now surely that is impossible. There is not a theatre in London where the arrangements for checking fire are absolutely complete. Speaking of iron curtains, what the County Council ought to do is to provide some sort of fire partition between the stage and auditorium, so that if a fire breaks out on the stage the public may be protected. In new theatres no doubt this is already compulsory, but the old theatres want it most.—The Chairman in the course of his remarks said as to improvements in the safety of our semi-public and private entertainments:—I hold that there is no doubt that the careful watching of the premises is one of the best precautions to take. You may have a building which is badly planned, but if it is thoroughly well watched, much of the risk is at once done away with. Mr. Sachs has drawn our attention, as architects, to the necessity of better planning, and he has done us a good turn, and the public a good turn. No doubt, if we were to think a little bit about the dangers from fire and from panic, we might be induced to consider our exits and our passages more carefully. I am not speaking more particularly of theatres, but of all buildings, including dwellings, and I am very glad that churches have been mentioned, because there is a considerable amount of risk in our places of worship. Perhaps I should say, however, that in planning our buildings well, so far as rapid exit is concerned, it is not fire we have got to plan against, but panic. As to the remarks Mr. Clark has just made; there is no doubt even if we have a well-planned building, we have not attained all that we ought to do as architects, but architects are paying some little attention to fire-resisting materials, whilst safe planning seems to be overlooked.—The vote of thanks was carried and acknowledged by Mr. Sachs.

The foundation stone of the new Parish Hall and Institute of St. Mary's, Bryanston Square, was laid recently.

The ceremony of opening the new Art Gallery, adjacent to the municipal buildings, at Reading, together with the opening of the new portions of the Free Library and Museum, took place a week ago.

A new Wesleyan chapel, built at a cost of £7000, which sum includes the cost of the site, was opened on Thursday week at Exmouth. The chapel will hold 612 persons. It is built in the Gothic style, with a tower 90ft. high.

It is stated that the presidency of the Royal Society of Painters in Water-colours, vacant by the death of Sir John Gilbert, R.A., has been offered to Mr. Alma-Tadema, R.A., and then to Sir Edward Burne-Jones; but each of these artists has found himself obliged to decline it. It is believed that the choice of the Society will ultimately fall upon Mr. Hubert Herkomer, R.A.

OBSERVATIONS have lately been made in America concerning the effect of the rays of a very hot sun on the tallest structures. The top of the Monument at Washington, which is 555ft. high, and weighs 81,720 tons, was ascertained to move 4in. to the north. The Obelisk at Central Park, New York, which is a single block of stone, deviates a trifle more, while the Bunker's Hill monument only gets about 2in. out of the perpendicular.

Professional Items.

BELFAST.—The Shankhill Road Mission Buildings, the foundation stone of which was laid recently, has a frontage of 92ft. and a depth of 135ft., free from ancient light restrictions on every side. In designing the building, it was sought to avoid the long corridors so universal in buildings of this description, by designing a central octagonal hall, with galleries round and a large dome light. This hall will give access to all the departments of the building which radiate from it. The building is divided into seven principal departments. The first of these is a large hall, capable of seating about 2000 people, designed in the form of an amphitheatre with a single gallery. This hall will have entrances and exits from the Shankhill Road and also from Carlow Street, and will be well lighted. In connection with the hall are gentlemen's, ladies', and choir committee rooms and cloak rooms. The second is a medical mission department, comprising a large waiting hall, capable of seating about 200; a doctor's consulting-room, and dispensary and dressing-rooms. It is entered by the main entrance from the building, and will also have a separate entrance from Carlow Street, enabling it to be used directly from the outside. The third, or business, part of the premises will consist of four large shops—two on either side of the main entrance—and also commodious offices over these shops. The fourth is a soup kitchen department. The fifth section comprises a minor hall and class-rooms. This hall will be situated on the first floor, and capable of accommodating 250 people. There will also be several class-rooms and committee-rooms. The sixth is a social and recreative department. These rooms will be situated on the second floor, and will comprise general workers' parlour, mens' reading-room and library, boys' club-room and girls' guild-room, and also ladies' private sitting room and bookstall. The seventh department is the residential training home. Over a part of the building there will be a flat roof, with staircase communication, so that it can be used as a recreation ground in the summer months. The materials proposed in the construction of the building are Scrabo stone for the front elevation and part of the return, with red brick for the remainder. The roof will be covered with Westmoreland green slates for the tower and front part of the building. The steel work for the large assembly hall is being carried out by Messrs. R. Moreland and Son, London. In order to give as light an appearance as possible to the building and cover the large span of the hall 90ft. in diameter, one row of steel columns has been arranged, which will also support the gallery, giving a cantilever for the three front rows of seats, and the roof trusses will be in the cantilever form, also with the lower end tied down by long bolts through the walls to bed plates in the foundations and the upper end of the trusses supporting the large central dome light. The N.A.P. Window Company's patent fittings are being adopted for principal windows. There will be fireproof doors over the greater part of the first two stories, thus making the building not only more secure, but preventing the passage of sound from one part to the other. Mr. W. J. W. Roome is the architect, and Messrs. McLaughlin and Harvey are the contractors.

BLAENAU FESTINIOG, NORTH WALES.—In an open competition for the New County Police Buildings, the design of Mr. T. Taliesin Rees has been selected. The accommodation had to include charge-room, cells, magistrate's room, court-room, solicitors' room, witnesses' room, superintendent's office, etc., together with the inspector's residence. There were nineteen sets of plans sent in.

HUDDERSFIELD.—The new infants' school in connection with Rashcliffe Church School was formally opened on Saturday week. The school is situate in St. Stephen's Road, opposite the church, and is Gothic in design, in consonance with the church. It contains a

central hall, 31ft. 6in. by 24ft., and two class-rooms, providing accommodation for thirty children each, and a room for fifty children. The principal entrance is from Bland Street. All the internal joiners' work is of pitch pine (varnished). The school is heated with hot water on the low pressure system, and all the rooms are airy and well ventilated. The plans have been prepared by Mr. J. Berry, architect, 9, Queen Street, Huddersfield, and the works have been carried out by the following contractors: Masons, Messrs. B. Graham and Sons; joiners, Messrs. Hampshire and Armistage; plumbers, Messrs. Sanderson Brothers; plasterers and slaters, Messrs. T. Longbottom and Sons; painters, Messrs. Haigh and Shaw; concrete and stone macadam asphalters, Mr. John Cooke; movable partitions, Mr. John Stones, Rosside, Ulverston; heating engineers, Messrs. Calvert and Co.

KINNEFF.—Some time ago the Northern Lighthouse Commissioners resolved to erect a new lighthouse on the rugged and dangerous Kincardineshire coast. The site selected is on the east point of the farm of Hallhill, in the parish of Kinneff, about 150 yards inland from the projecting rock or headland known as the Tod Head, from which the new lighthouse will take its name. Operations were begun in the end of February, 1896, and the tower and other buildings connected with it are now nearly finished. Although the buildings are erected a short distance from the top of the cliffs, it was necessary to go down 22ft. before a solid foundation was got for the tower. The foundation is made up of concrete to about 2ft. above the level of the ground. From the ground to the dome on the top of the tower is over 50ft., and the dome is 150ft. above sea level. There is about 10ft. of glass at the top, surmounted by a copper dome with raised top, which gives it a very pleasing appearance. Besides the tower, a block of buildings two stories in height has been erected for dwelling-houses for the keepers. There is ample accommodation for three families, also engine-room for three engines. The whole of the buildings are of very substantial workmanship. The foundations are concrete, the walls being built with bright facing bricks outside and common bricks inside, and the doors, windows, rybats, &c., are of freestone from Brechin quarries. The roofs are all flat, being covered with strong iron beams and buckle plates covered with a heavy coating of cement. There are also two large concrete tanks for storing rain water off the houses, for the engines, &c.; while the whole buildings are enclosed with a substantial brick wall. The contractors are Messrs. Watson and Sons, Glasgow.

LONDON.—The important extension of St. Stephen's National Schools, Westbourne Park, which were opened on the 30th ult. by the Right Rev. Mandell Creighton, D.D., is designed to incorporate the existing building so as to form one large school, equipped with all the improvements of modern school buildings so far as a close study of cost would allow. The site is a fine open one on a broad street with the immense area of the Great Western Railways goods yard in front, so that the school buildings are visible at a long distance, and enjoy both light and air to an unusual extent. The new scheme divides the children into three isolated divisions on different floor levels with separate entrances and staircases. It supplies the great want of class-rooms in addition to the old school-rooms, the idea being to have in addition to their school-rooms as at present one infants' class-room and three class-rooms for boys and girls respectively. The scheme also gives a cloak-room to each department, whereas in the old buildings there was no proper provision for this purpose, besides which a separate playground is now allotted to each school, where formerly all had to use one small courtyard in common. Lastly, the lavatories are now all outside instead of inside the main buildings, and are now upon the proper scale, whereas before they were inadequate in number and very unwholesome. In view of the above defects the old buildings were about to be condemned by the Educational Department, being moreover very much

overcrowded in all schools. Part of the scheme has been postponed for the present, but the actual increase in the numbers of places provided will more than double the former accommodation. The new extension occupies the site of three houses which were purchased for the purpose and pulled down, the frontage of the schools being thus doubled. The distribution is as follows:—The basement is used for parochial purposes in connection with the adjoining house; half of the ground floor provides a small school-room 24ft. by 30ft., the remainder is occupied by the new girls' and boys' separate entrances and staircases, as well as by the cloak-rooms for both departments; the first floor gives two large classrooms for sixty children each, while the second floor is the same except that here the two rooms can be thrown into one by means of a folding partition. The schools are lighted throughout by electricity, and are probably one of the first of the National schools to be so lighted. This work has been executed by Mr. W. Mackie. The building has been very well built by Messrs. Rudd and Son, of Grantham, under the personal supervision of the architect, Mr. Arthur T. Bolton, of 2, The Sanctuary, S.W. The cost has been about £7000, including the site, which cost £2000. The general contractors are Messrs. Rudd and Son, of Grantham, the other firms engaged are:—Masonry, Monks Park stone, the Bath stone firms; red moulded bricks in chimney stacks, Messrs. Wheeler, Reading; brick facing special picked stocks, Messrs. Broad and Company, London; Imperial green slating, Messrs. Roberts, Adlard, and Company, London; fire-proof floors and staircases, Messrs. Ward and Company, London; woodwork flooring, Messrs. Turpin, London; plumbing, Messrs. Lincoln and Sons, Grantham; school sanitary fittings, Messrs. Adams and Company, London.

NEW BENWELL.—The foundation stone and memorial stones of the new Presbyterian Church of England at New Benwell were laid last week. The church is being built on a block of land in Armstrong Road. The hall occupies the eastern portion of the site, and between the church and hall the class-rooms and vestries are placed. The church is planned with nave and aisles, the aisles and west end having galleries, the whole providing seating accommodation for 650. The entrances are placed in the west front, giving access to porch and vestibule. Two doorways at the east end give access to the vestries and class-rooms, and also answer as a means of exit when required. The floor of the church has a fall of 9in. in the length; the pulpit and communion platform are at the east end, and the west gallery has been reserved as the organ chamber. On the same level as the church, and immediately behind, are placed the minister's vestry, a room for ladies, and a small hall for prayer meetings, and infants' class, and a flight of short steps leads to the large hall, with accommodation for over 400, the principal entrance to which is in Armstrong Road. The first floor over the vestries is occupied by three large class-rooms, and there are ample and well-lighted lavatories on all the floors. The whole of the block of buildings is designed in the Early English style; the walling is of local stone, in coursed rock facing, with chiselled stone dressings, the bays of the nave having buttresses at every principal, and the alternate bays having the upper windows carried up as dormers. The west front has two projecting porches with mullioned and traceried window in gable over the same, and to the north a small octagonal turret breaks the line between the gable and staircase roofs, a buttress marking the southern division. Internally, the nave is divided from the aisles by an arcade of five bays on either side, and the east gable has a traceried rose window. The church and hall, including vestibule and staircases, are to be heated by the low-pressure hot water system. Previous to letting the contract, the architects had trial holes dug on the site, and found it necessary to go down about 16ft. all along the west front to secure a suitable foundation. To overcome this difficulty concrete piers were carried down to the necessary depth, the spaces between being bridged with concrete blocks about 4ft.

wide and 2ft. thick, in which rolled steel girders are embedded to strengthen the concrete and tie the piers together. The whole of the foundations throughout are of Portland cement concrete, and are taken down to the clay. The architects are Messrs. Bradenoch and Bruce, and the contractor is Mr. Thomas Hunter.

ST. LEONARDS.—St. Peter's Church was built from the design of Mr. James Brooks. The superb reredos that now adorns the eastern end of the sacred edifice was not erected until 1895. The somewhat unique representation of the crucified Christus in white marble that forms so striking a feature in this finely-conceived reredos is an exact copy of the very earliest representation in existence of our Lord's Passion. It is a *fac-simile* of the celebrated *Vultus de Luca*, or Crucifix of Lucca, in the cathedral in that city of the sunny south. Legend declares it was the work of Nicodemus himself, who is recorded to have been a cunning worker in wood and metals. Certainly it was in the cathedral so long ago as A.D. 782, and has been piously adored by the faithful from those far away days until the present time. Recently a couple of handsome carved oak screens have been erected at the north-eastern end of the church. Like the sacred fane generally, they have been designed of early character by Mr. Mark J. Lansdell, of Hastings. They are fashioned of well-seasoned Kentish oak, and are capital specimens of modern craftsmanship in that particular everlasting material. Like the reredos, they are the handiwork of Messrs. Hems and Sons, of Exeter.

Views and Reviews.

PRACTICAL BUILDING CONSTRUCTION.

We are glad to welcome the appearance of a second edition of Mr. Allen's well known and excellent book on Construction, which has now taken a recognised position, and is to be found in the collection of most younger students as well as on book shelves of many older men. Though there are several other similar books on the market, prepared, as is this, mainly for the use of students who are working for the South Kensington examinations, and all, consequently, upon much the same lines, this is equal to any of them and superior to most in clearness of illustration, avoidance of unnecessary matter, and simplicity of arrangement, which leads students on to think for themselves rather than to fly to their books upon all emergencies. Possibly there is still an opening for a work upon Construction which is written from the architect's point of view, and including other than elementary problems, to show how unusual difficulties have been met, and thus to assist the student to solve difficulties for himself without falling back upon hackneyed and possibly unsuitable methods. There is always a tendency in works of this class to repeat undesirable forms of construction upon the authority of their predecessors, and the author of this book will pardon us if we point out that he has been guilty of this in two instances at least. The methods of bonding shown in Figs. 181 and 182, with the assistance of shaped bricks, are such as would be most unlikely to be adopted in practice, and the wisdom of carrying rain-water down the interior of a column as shown in Fig. 449 is more than doubtful. On the other hand the chapter upon fireproof floors, though short, is eminently satisfactory and up to date; but we fancy that the chapter upon sanitation would have been almost better omitted, it is treated in so vague a manner, just imparting that little knowledge which is dangerous, and the two chapters upon stresses and the calculations of strains are clearly put, though the diagram would have been rendered much more easier of comprehension if Bow's notation had been adopted. We can only hope that further editions of the book will be called for in the future, and that it will be steadily extended and improved as time goes on.

"Practical Building Construction." By J. P. Allen, Crosby, Lockwood, and Sons, 7s. 6d.

Enquiry Department.

WAREHOUSE FLOORS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly inform me through your "Enquiry Column" whether sea sand, used in the making of concrete for warehouse floors, would be a cause for such floors being damp, although two years have passed since same were laid?—Yours truly,

"BETON."

Liverpool, October 25th, 1897.

You do not say whether the floor is a ground one or not, but if a fireproof floor the use of sea-sand in the concrete is undoubtedly a sufficient cause for the dampness, and it may be proved by observing the difference in appearance after dry and damp weather. If the concrete is on the ground, other causes may also exist; the surface drainage may be imperfect, or the bed may be of unsuitable material. For a damp site the concrete should be bedded on 6in. to 12in. of brick rubbish well rammed (this will absorb much of the surface damp); next flout a layer of granolithic cement, then the concrete, made with well-washed river or pit ballast and Portland cement (five to one). If the cause is salt in the sand, your only remedy will be to re-lay.

GLASS CHIMNEYS.

DEAR SIR,—Can you kindly inform me through what merchants I can buy "Acme" lead flint glass chimneys for incandescent lights. They are made in the United States of America, and the trade-mark etched on each chimney is "Trade Mark—Acme—Lead Flint," and are wrapped in pink printed paper.—Yours truly,

M. A. THORNTON.

Messrs. Young and Marten, before whom we laid our correspondent's query, have written us as follows:—"As a result of repeated enquiries, we have discovered the manufacturers of the glass chimneys referred to, and, having satisfied ourselves that they are a good saleable article, we have contracted an agency for the sale of them, and a stock is now shipped, and on the way to us; in the course of a few days, we hope to be in a position to supply."

WORKSHOP PLANNING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—May I ask whether you can give me any advice in the following matter:—Wanted to erect workshops for (1) carvers and (2) carpenters and joiners, on the most modern principles as to light and dimensions, etc. Can any of your readers refer me to an example erected recently, or do they know of any book published on this subject?—Yours truly,

PROVINCIAL ARCHITECT.

October 25th, 1897.

In planning a joiner's shop, due regard must be paid to the question of the kind of benches employed—double or single. A single bench, accommodating one man, is 27in. wide, with a 21in. walk. A double bench, for two men, is 36in. wide, with a 36in. walk. The double cover the more floor space, provide for the more men, but require lighting at both ends, and are cumbersome. Workmen generally prefer single benches. A top light is best, and should be provided by lifting skylights over the front ends of benches. If side lights are used, the heads should not be less than 5ft. above the bench, and the sill 1ft. above; lower is dangerous. Upper sash to open on centres, or hopper ventilators. Factory Act (1895) requires 250 cubic feet of air space per man; 400 cubic feet of artificial light is used. Queen-post roof is best; the centre can be used for storing and drying timber. Use queen bolt and strut, butting straining beam and principals. Gas brackets to be T pendants, with universal joint. Provide a louver ventilator in roof, and a hood over glue stove for escape of steam. Heat with two 4in. coil pipes, cased with perforated wood. Have no machinery in shop or on same floor except grindstone; its presence is fatal to high finish. A platform under cover should be provided for carpenter's

containing 150 square feet, to set out, and frame trusses, framings, centres, &c. A wood carver's studio requires a north light, preferably at the end of the benches or overhead; benches to be as long as possible, 3ft. wide, 3ft. high, framed with 3in. beech tops, a few stout legs, no rails. Two good shops recently erected are the Works Department, Postal Telegraphs, Mount Pleasant, Clerkenwell; and Messrs. Brass and Co.'s, at Page Street, Westminster. We know of no books on the subject.

THE WINTER SESSION.

MONUMENTS AT GLASGOW.

THE Glasgow Ecclesiastical Society met on Tuesday week in the Cathedral, Mr. John Honeyman in the chair. A paper was read by the Rev. P. McAdam Muir, D.D., on the "Monuments and Inscriptions in the Cathedral." He dwelt upon the interesting fragment of a recumbent figure under one of the arches dividing the chapels of the crypt, now recognised as meant for Bishop Wishart, the "fighting bishop" of Robert the Bruce's time, but long considered to be an effigy of St. Mungo. Another interesting monument to which he called attention was that of Archbishop Law, in the south-east corner of the choir, who died in 1632, and whose virtues are commemorated in a Latin inscription, a translation of which was given. In Blackader's aisle the initials J. D. with the date 1658 are scratched upon the east wall, and this is supposed to be the only memorial of James Durham, the covenanting minister of the Cathedral, during the years when the Covenant was dominant in Scotland. Durham had the felicity of preaching before Cromwell, and though he did not spare that enemy of the Covenant, he was highly complimented by the Protector, who remarked to his daughter, who sat beside him, that he was fit to be chaplain to any of the princes of Europe. Dr. Muir then proceeded to give an account of the more modern monuments, of the colours that are preserved in the Cathedral, closing his list with the memorial of the late Dr. Burns. The lecture, which was most interesting, was listened to with great attention, and Dr. Muir was cordially thanked for the lucid manner in which he had treated his subject. In the course of the discussion it was remarked that something might be done to commemorate those men of marked distinction whose names are connected with the Cathedral of whom no memorial exists.

"OPEN ROOFS."

The opening meeting of the winter session of the Architectural Association of Ireland was presided over by Mr. R. Canfield Orpen. Mr. Pentland delivered an interesting lecture on "Open Roofs," in the course of which he gave an outline of the history of house construction in ancient times, dealing in a concise manner with the various styles adopted by the Pelasgians, Etruscans, Romans, and others, and explaining the differences between each and their analogy, in some instances, to modern buildings. The expression, open roof, he said, was not an euphemism, but meant that houses and other structures were made with roofs which were not covered by a ceiling. He gave some interesting particulars concerning Italian Architecture, dealing shortly with the construction of the domes on ancient buildings and modern European cathedrals. He referred to the flat-roofed houses of the Syrians, and their resemblance to those of modern structures, as also the climatic effects on Architecture. We hope to publish the paper in extenso shortly, with illustrations.

THE largest railway arch in the world is stated by Mr. Supplee to be that spanning the river Pruth at Jaremeze. It is built of stone, and has a span of 65 metres or 213ft., and a central height of 17.9 metres or 58.6ft., measured at high-water level. There is a still larger arch in America, the Cabin John Arch, near Washington, with a span of 220ft., but this only carries an aqueduct, and is therefore not comparable with one subject to stresses produced by the motion of trains.

Trade and Craft.

EXHIBITION IN TURNING.

The twenty-eighth annual exhibition of specimens of turning in wood and pottery, under the auspices of the Turners' Company, was opened last week at the Mansion House, by permission of the Lord Mayor. The exhibits in wood are small in number, owing, it is stated, to the great activity in the turning trade, but the judges report that "the excellent quality of the work is generally maintained;" and they express their satisfaction at the increase in the number of the apprentice competitors. The pottery exhibits are stated by the judges to be "probably as numerous as they have ever been," but the opinion is expressed that "in point of merit they scarcely come up to the standard of five years ago." The judges of the exhibits in wood are Messrs. Burdett-Coutts, A. Bevan, A. Murray (City Surveyor), George W. Budd and G. W. Taylor; and the judges in pottery are Messrs. W. Brindley, W. Rome, A. S. Murray (British Museum), and Lieutenant-Colonel A. J. Copeland. The first prize in the wood exhibits—which has been awarded to Mr. F. Powers, Eastfield Road, Andover, for a rose window, or centre flower, in oak, constructed of four pieces of turning—consists of a silver medal, the freedom of the Company, and, subject to the consent of the Court of Aldermen, the freedom of the City of London, and five guineas. The first prize in the apprentices' class has been gained by L. G. Seegar, of Lynedoch Street, Kingsland Road; and in the amateurs' class, first certificates of merit have been awarded to Mr. S. A. Harding, Ingelwood Road, West Hampstead, and to Mr. W. H. Lowndes, of Church Street, Aylesbury. In the pottery exhibits the first prize—which is precisely similar to the first prize given in the wood exhibits—has been gained by Mr. S. Stocks, Upper Kennington Lane, for a terracotta vase thrown in one piece. The first prizes in the apprentices' classes have been awarded to Arthur Newman, A. Kerridge, E. B. Martin, John Lovekin, and F. W. Millward. The Rev. Charles C. Ellison exhibited—but not for competition—a beautifully worked tobacco-box in ivory.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERAVON.—For the erection of eleven houses and offices. Messrs. Thomas & James, architects, Port Talbot:—
John Davis ... £1,675 John Nicholas ... £1,368
S. Rees and Co. ... 1,393 Jenkin Rees, contractor,
C. and F. Gaen ... 1,385 Sandfields, Aberavon* 1,365
* Accepted.

ABERDEEN.—Accepted for the erection of a fire station, for the Town Council. Mr. A. H. L. Mackinnon, architect, 75, Union-street, Aberdeen:—
Masonry.—Alexander Cheyne, Aberdeen ... £6,850 19
Carpentry.—George Jamieson, Woodside ... 2,100 0
Ironwork.—John Grant, Aberdeen ... 476 6
Slating.—Adam and Co., Aberdeen ... 251 0
Plastering.—Stewart and Co., Aberdeen ... 708 10
Plumbing.—A. B. Robertson, Aberdeen ... 519 0
Painting and Glazing.—Edward Copland, Aberdeen ... 167 0

BARKING.—For the erection of Public Baths at the rear of the Public Offices, East-street, Barking, Essex, for the Urban District Council. Mr. C. J. Dawson, architect, Barking. Quantities by Mr. Geo. Lamb, Barking:—
Cliff Ford ... £9,490 F. J. Coxhead, Leyton-
Geo. Sharpe ... 7,813 stone* ... £7,686
* Accepted subject to variations.

BECKENHAM.—For making-up Kent House Road, for the Beckenham Urban District Council. Mr. John A. Angell, engineer and surveyor:—
J. Jackson ... £2,822 0 0 S. Hudson, Street-
Fry Bros. ... 2,016 17 10 ham Hill, Street-
J. Mowlem & Co. ... 1,928 0 0 ham, S.W.* ... £1,857 9 1
G. Iles ... 1,905 0 0 Lawrence and
Thacker ... 1,570 14 9
* Accepted.

BIRMINGHAM.—For erecting a new epileptic block at the Workhouse Infirmary, for the Guardians. Mr. W. H. Ward, architect, Paradise-street, Birmingham. Quantities by Messrs. Harris and Harris, Bennett-hill, Birmingham:—
W. S. Seamark ... £2,385 0 0 B. W. White-
H. Vickers ... 2,828 0 0 house and Son ... 2,632 0 0
E. Hughes ... 2,311 0 0 J. Freeman and ... 2,617 0 0
W. Hopkins ... 2,770 0 0 Son ... 2,613 0 0
W. Bloore ... 2,760 0 0 W. Robinson ... 2,560 0 0
W. and J. Webb ... 2,691 0 0 F. Nicholson ... 2,485 0 0
W. J. Whitall ... 2,670 0 0 J. Atkinson ... 2,390 0 0
and Son ... 2,653 0 0 Smith and Pitts ... 2,383 6 2
J. Goodwin ... 2,653 0 0 R. Fenwick, Bir-
mingham* ... 2,367
* Accepted.

GLACTON-ON-SEA.—For the erection of three shops and residences at the corner of Station-road and Carnarvon-road, for Mr. T. Rowland. Mr. J. W. Martin, architect:—
E. West ... £3,270 H. J. Linzell ... £2,766
Myall and Ellis ... 2,850 T. Dixon ... 2,607

CHINGFORD.—For the construction of roads, and stone-ware sewers with manholes and gullies, &c., on the Chingford Rise Estate, Essex, for Mr. Douglas Gordon MacBae. Messrs. Douglas Young and Co., surveyors, of 51, Coleman-street, London, E.C.:—
W. Gibbs and Co. £5,800 13 3 Thomas Adams £3,263 0 0
N. Neave & Son ... 3,985 0 0 W. and G. French
A. W. Porter ... 3,655 18 6 Buckhurst-hill* 3,150 0 0
Lawrence and Thacker ... 3,646 17 6
* Accepted.

COVENTRY.—For additions to Board Schools, Red-lane, for the School Board. Messrs. G. and I. Steane, architects, 22, Little Park-street, Coventry. Quantities by Mr. Geo. Kenwright, Birmingham:—
T. G. Golby ... £8,100 C. G. Hill ... £8,145
T. Rowbotham ... 9,022 J. Isaac and Sons ... 8,059
E. Orton ... 8,850 Kelley and Son ... 7,640
A. A. Winnett ... 8,675 J. Corvett ... 7,575
C. Haywood, jun. ... 8,635 C. Garlick, Coventry* 7,400
C. H. Barber ... 8,175
* Accepted.

HERTFORD.—For headquarters and drill hall, for the Hertford Detachment of the 1st Herts V.B. Bedfordshire Regiment. Mr. J. Farley, architect, Old Cross, Hertford:—
J. Rayment and Son £2,062 8 Ginn and Son,
J. Birt ... 2,068 0 Hertford* ... £1,748 10 0
H. Norris ... 1,984 0 A. Scales ... 1,695 8
T. Hunt ... 1,761 0
* Accepted.

HULL.—For pulling down existing premises and erecting new dormitories, day-rooms, bath-rooms, &c., and mortuary, &c., at the Workhouse, Anlaby-road, for the Governor and Guardians. Messrs. Freeman, Son, and Gaskell, architects, 11, Carr-lane, Hull:—
Mark Harper ... £3,307 15 0 J. R. Woods* ... £3,030 14 9
Thos. Goates ... 3,254 16 5
* Accepted.

[Several single tenders were received.]

KIRKBY LONSDALE.—Accepted for alterations and additions to the "Royal Hotel," Kirkby Lonsdale, for Lady H. B. Centinck. Mr. John Kassell, architect, Kirkby Lonsdale:—

Masonry, Bricklaying, Plastering, and Slating.—William Bailiff, Kirkby Lonsdale ... £1,006 2 3
Joinery and Carpentry.—Timothy Hirst, Keighley ... 870 0 0
Ironfoundry, Plumbing and Glazing.—Anthony Moorhouse, Kirkby Lonsdale ... 278 15 0

[Architect's estimate, £1,670.] ... £1,654 17 3

LONDON.—For painting and repairs at the undermentioned fire stations, for the London County Council:—

Camden Town Station.
A. D. Smith and Sons £90 0 J. W. Meller ... £85 10
A. Hackworth ... 89 0 Pease and Kentish* ... 85 0
Macfarlane Bros. ... 88 5

Brompton Station.
G. N. Watts ... £33 0 C. F. Kearly* ... 49 0
Lole and Lightfoot ... 57

Cherry Garden Street Station.
L. Whitehead and Co. ... £110 H. Line ... £98 0
H. Cooke ... 105 G. Parker* ... 95 0
Tunbridge and Day ... 99

Hackney Station.
J. Outhwaite & Sons £206 0 A. D. Smith and
F and F. J. Wood ... 198 0 Sons ... £127 0
Hearle and Farrow ... 150 0 Vigor and Co. ... 125 10
W. Newman* ... 113 17

Deptford Station.
H. Cooke ... £86 13 Tunbridge and Day ... £50 0
L. Whitehead and Co. ... 79 0 H. Line* ... 43 0
G. Parker ... 59 0

Waterloo Road Station.
H. Cooke ... £94 15 J. Mills ... £77 0
T. Laphorne and Co. ... 84 0 R. Harding and Sons ... 76 10
G. Mundy and Sons ... 82 0 D. G. Laing and Son* 70 0
* Accepted.

COMPETITION.

DORKING UNION. TO ARCHITECTS. AMENDED ADVERTISEMENT.

The Guardians of the Dorking Union invite COMPETITIVE DESIGNS and PLANS, with descriptive report thereon and approximate estimates, for the ERECTION of an INFIRMARY upon the Workhouse Grounds, at Dorking, at an estimated cost of not exceeding £4000.

The Architect whose designs are adjudged of sufficient merit by the Guardians or their assessor (as the case may be), and are placed first, will be employed to act as Architect in the erection of the building, and will be paid for his services according to the usual scale. The Architects submitting plans of sufficient merit and adjudged second and third in order, will be awarded premiums of £15 and £5 respectively. The plans which are placed first shall become the property of the Guardians, and any alteration or modification required by the Local Government Board shall be made by the designer free of charge. Particulars of the accommodation, &c., required will be forwarded on receipt of stamp directed foolscap envelope.

The plans, drawings, &c., are to be delivered at my Office, 35, High-street, Dorking, on or before WEDNESDAY, DECEMBER 15th, 1897.

GEORGE SCALES.

Dorking,
 October 13th, 1897.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

NORTH RIDING of YORKSHIRE COUNTY COUNCIL.

TO CIVIL ENGINEERS, SURVEYORS, &c.
 The County Council of the North Riding of Yorkshire are prepared to receive APPLICATIONS for the OFFICE of ASSISTANT SURVEYOR.

The applicants must be capable of preparing contract drawings and specifications, surveying and levelling, and setting-out and superintending of structural works, and the inspection and control of main roads.

The Assistant Surveyor will be required to act generally under the direction of the County Surveyor, and must devote the whole of his time to the duties of his Office, and will be required to live in Northallerton.

The appointment will be held during the pleasure of the County Council, subject to three months' notice on either side, and the salary will be £200 per annum, with office accommodation, stationery, &c., and approved travelling expenses.

Applications, stating name, age, present employment, and previous experience, accompanied with copies of three recent testimonials, addressed to the Chairman of the Work, Highways and Bridges Committee, Court House, Northallerton, and marked "Application for the Office of Assistant Surveyor," may be sent on or before DECEMBER 11th next.

WILLIAM C. TREVOR,
 Deputy Clerk of the County Council.
 Clerk of the Peace's Office,
 Northallerton, October 27th, 1897.

JUNIOR ASSISTANT or IMPROVER REQUIRED in Dublin Architect's office.—Address, stating age, experience, and salary expected, and enclosing copies of testimonials, to W. KAYE PARRY, M.A., 35, Dame-street, Dublin.

Long-Suffering Architects.

YET another to swell the long list of bogus competitions. Verily, architects are possessed of Job's patience to stand so many fleecings. And one begins to wonder what exactly the Institute Competitions Committee is for and does. The Tottenham School Board has remarkable ideas of the value of the Profession's time. If we are not mistaken it lately advertised at least one

or Committees; and for an extra set of plans, tracings, and specifications; also for making any alterations to the competitive plans, &c., required by the Board. (b.) The contract plans and specification to become the absolute property of the Board. III. The rough sketch enclosed is what the Board thinks necessary. *No curtailment of this can be accepted.* The clerk left out one item, viz., a ladies' lavatory. Inasmuch as women are eligible for seats on a School Board, it is desirable that there should be a separate lavatory for ladies. It is hoped that architects will only take the clerk's rough sketch for general guidance. Improvements upon this will naturally be expected, as the clerk is not an architect. IV. With the designs should be sent a concise statement (either in print or type-writing) showing what materials are proposed to be used and the probable cost of the undertaking including architect's commission. If, when the tenders are opened, the lowest tender from a responsible builder is palpably higher than the estimate of the selected plans, then the Board reserve to themselves the right to abandon the preferred

walls drawn to a scale of 20ft. to an inch. (b) Plans of ground and other floors drawn to $\frac{1}{2}$ in. scale. (c) Front, side and back elevations drawn to $\frac{1}{2}$ in. scale. (d) Two sections at least drawn to $\frac{1}{2}$ in. scale. No perspective drawings will be allowed. The whole of the drawings to be finished in Indian ink without shading or colour, except the sectional parts of walls. All printing to be plain block. The drawings to be mounted on plain strainers. XI. The sanitary arrangements must receive the closest attention, and must comprise the latest improvements. XII. The buildings to be of brick, with such stone, brick, or terra-cotta dressings as the design may require. XIII. Joiner's work to be stained and varnished inside the buildings. Roofs to be covered with felt, boarding and plain tiles. XIV. No design, report, or specification shall bear any motto, device, or distinguishing mark, but shall be accompanied by a sealed envelope fastened to the plans containing the full name and address of the competitor. Each of the accompanying documents will be numbered in order of receipt by the Clerk of the Board. XV. The Board will not

A.A. GOLF CLUB HOUSES COMPETITION. DESIGN BY L. G. BIRD.

school competition at $3\frac{1}{2}$ per cent. By the way, the Institute will probably see to it if any member entered at that percentage. We have now a still worse example from the same Board. In July, 1897, an advertisement was issued for School Board Offices. To obviate further preamble, here are the "Conditions."—I. The Board will decide upon this competition, and they may, if they think fit, ask the assistance of a professional assessor to guide them in their choice. *The Board do not bind themselves to accept the lowest or cheapest design.* II. The Board propose to employ the architect whose plans are preferred to carry out the works at a commission of 5 per cent. on the total cost of the works, subject to the following modifications and conditions. (a.) The 5 per cent. Commission on the total cost of the works to include all necessary plans, specifications, all travelling expenses, and visits to and inspecting the works; attending all meetings of the Board

designs without any liability of any kind to the architect. V. The elevation and general arrangement of the buildings must be in nice harmony with the Downhills schools. VI. The Board themselves will arrange for the fittings of the offices, and will not require the assistance of the architect for this purpose, except for the gas-fittings and lavatories. VII. Nine-inch work in any of the external walls will not be considered adequate. VIII. The heating should be by open fireplaces, but it would be advantageous if the heating of the building could be aided by pipes fed on the low-pressure steam system. IX. It is essential that there be no question about the adequate amount of light either by day or night. X. The designs to be in accordance with the building rules of the Tottenham Urban District Council. The drawings to consist of:—(a) A block plan showing position of buildings, system of drainage, and positions of fence and boundary

discuss the decision they ultimately arrive at with any architect. They decide now, however, that any design not in accordance with all or any of these conditions will be at once set aside and rejected. XVI. With regard to the cost, the Board leaves this question open to the architect in his description, &c., under Clause IV. *The cost will not necessarily by any means be the leading factor in the selection of the plans.* In other words, the Board are not looking out for "the lowest bidder." XVII. Any attempt to influence the decision of the Board or the assessor will disqualify a competitor. XVIII. No competitor is to submit more than one design. XIX. The drawings to be forwarded by rail or parcel delivery to the undersigned by September 6th, 1897, endorsed "Design for New Offices." The italics are ours. Twenty-two architects, we think, competed. The next thing we hear is through the Tottenham

Weekly Herald, reporting the decision of the Board. It appears from this that although it had inserted Clauses II. and XVI. in the conditions, it had privately resolved to limit the expenditure to £3500, and this sort of private resolution has a way of getting known locally! At any rate, dissatisfaction was expressed at the meeting, and some one proposed that *they wash their hands of the whole competition and have another!* This was unanimously adopted! Next appeared an advertisement for the new competition. This appeared before the competing architects even heard the Board's decision through the papers in which it originally advertised. We give also the Board's letter to the competitors herewith:—"Dear Sir,—I am directed by this Board to thank you for sending in a competitive design for these Offices. The Board, however, arrived at an ultimate decision not to accept any one of the plans sent in, and to return those received to the various competitors, and to have a fresh competition. On hearing from you I shall be happy to send you a fresh set of conditions.—I am, dear sir, truly yours, J. F. ADAMS, Clerk to the Board." That the Board was prepared for something of this kind is clear by the insertion of condition XV., and, although it will discuss nothing with the architects relating to its decision, the only course open is for the competitors to instruct their legal advisor to do so. We sadly fear that if the twenty-two competing architects sent in their accounts for a hundred guineas each this particular Board would not see office again at the forthcoming election. In fairness to those whose brains have been more or less sucked through these deceptive conditions, the best the Board can do is to offer them some remuneration for its breaking faith with the competitors. If it will not, in the interest of the Profession, the competitors should club together and fight the case. Again, what guarantee has the second lot of competitors that the same sort of game will not be tried again? Absolutely none; for the second conditions are almost identical with the first, except that the definite limit of £3500 is imposed. It is clear that the Board has shown itself incompetent to judge the competition, hence we trust that the members of the Profession will honour this second invitation in the only way it deserves. The Board has one way out of its difficulty—to place someone first and pay him 2½ per cent. for his trouble, or employ him at 5 per cent. and make him alter his design. There seems to be some local influence about the whole affair which obscures the motives of the Board.

CONTRIBUTED.

Of Agnosticism in Art.

ELDERLY essayists, from Cicero downwards, have laboured to present a favourable case for the advantage of growing old. Age, they say, is tranquil, serene, and free from illusion. It sees life sanely, and sees it whole, and is not misled by the mirage which deludes the young. That is to say, age is cynical—amiably so or bitterly, as the successes or disappointments of life may predominate. Age, therefore, is, without enthusiasm, the great dynamic force which moves the world. This mental attitude is natural in those who have passed the hey-day of life, and exceptions to the rule are regarded with wonder and surprise. There are instances which all can note of the survival of youthful ardour—an ardour which has defied the march of time; and we know, as Thackeray says, that the giant in the fair is 8ft. high. But these are phenomena, and out of the common course, and we recognise them as strange and exceptional. The agnostic spirit befits age—age, which has outlived the convictions which are the prerogative of youth. One who can look back upon the

activities of half a century, beholds his former self as in a dream, and is amazed at the hold which faiths, artistic and otherwise, once had over him. In the fifties, there was no Architecture but Gothic, and Pugin was its prophet. With what unquestioning faith we all marched under his victorious banners; and how earnestly and sincerely we echoed the fine scorn which that great genius showered upon all who were not of the chosen people. "True principles" were then true indeed, and the dicta of the leader were accepted with the conviction which nothing could shake. Then arose a new teacher, and many of the faithful were drawn away by the impassioned pleading and the resistless rhetoric of an Oxford undergraduate. The new enthusiasm was equal in force to the old, but, like the old, it yielded to the effects of time. And now one looks abroad, and looks in vain, for the equivalent of the discredited faiths of his prime. What teacher do the young men of to-day follow, and what code of artistic law is operative for them. Classic and Gothic schools have had their day, and even the mixed or "go-as-you-please" manner is becoming obsolete. There never was a time when Art was so much written and talked about; but what do we now understand by Art? Once it had a meaning. What does it mean now? Let those amongst the young men of the day who have any definite views on the subject reply. It may be that they are guided by principles, real though unexpressed. It may be that they are merely looking forward with hope to some new developments in Art, now that the old trammels are removed. The young architects are more numerous, better educated, and have more facilities of every sort than fell to the lot of the generation they are succeeding. It is fair to suppose that they will achieve great things. But it is difficult to see upon what line of thought or action they are to proceed, and until some definite artistic creed is formulated, one can but conclude that they are embarked without compass or chart, and that their destination will be more or less the result of happy chance. Time, youth, energy, enthusiasm, may in the end evolve some definite artistic method stronger and more enduring than those which are gone. Meanwhile, one can but regard them all as occupying in the Art world a position which is only expressed by the "ill-sorted" word Agnostic. E. I. B.

First Principles in Modern Architecture.

WHEN in doubt the scientist invariably goes back to first principles, and it is a healthy sign of the times that architects are now intent upon doing the same. For a long, dismal period they were content with proportion and style, and although proportion is a principle of the first importance, an evanescent, subtle essence, it was scarcely considered so much as style, and style is no more to the architect than language is to the literary man. No one can doubt but that Shakespeare, Goethe, and Voltaire would have produced equally good and characteristic work had each written in some other language than that which circumstances led him to use; and in reading the works of these great masters one does not think so much of their being English, German, or French, as that they express great thoughts and emotions. Thus, while an architect must of necessity master one style, as the literary man masters his native language, and must make himself conversant with others in order to understand the works already composed in them, it by no means follows that this style should dominate the thoughts which he wishes to express. First principles are of a much more delicate character than

this, not to be learnt as a style or language is learnt, but of the nature of emotions which can be expressed in any style. The power of doing this takes long to acquire, and it has to be sought diligently, the first necessity being that he who seeks shall have some idea of what he is looking for. It accordingly becomes of importance to know what it is that a building is capable of expressing, and to find this out one naturally turns to works of past ages, to discover that the Egyptian buildings were expressive of grandeur, mystery, and overbearing pomp; that the Grecian work was the very concrete expression of high intellectuality; that the Roman was masterful and rugged beneath, but with a veneer of superficial polish upon the surface; while the Gothic showed high aspiration and seeking after truth and holiness. These are all high ideals, and these are the real first principles of Architecture. Each building should express something in its general mass, its proportion, and its details; and the architect succeeds as perfectly when he builds a cottage which symbolises rural peace, or a little country church which is suggestive of worship, as when he erects a palace of great size and magnificence of display. G. A. T. M.

A QUESTION OF VIEW.

TRANSLATED FROM THE PARIS FIGARO.

THE ENGINEER.—This would be the best site for our station.

THE DEPUTY.—Quite so.

ENGINEER.—You see, we shall be in the very centre of Paris, and right in the heart of the business quarter.

DEPUTY.—And it would be a convenience for everybody. . . .

ENGINEER.—Then I may count on your support in the House?

DEPUTY.—Oh, certainly . . . yet, before promising definitely, I should just like to make sure of one detail.

ENGINEER.—With pleasure. What may that be?

DEPUTY.—Let us just see if the new station will interfere with the view. (*Makes a few steps, and looks around him.*) Hum! . . . the buildings will be here, won't they?

ENGINEER.—Well, yes, just where we are standing.

DEPUTY.—Do you mean to tell me, then, that we shall no longer see the bend of the Seine from here?

ENGINEER.—I'm afraid you will scarcely be able to see. . . . The view will naturally be quite shut out from this side.

DEPUTY (*stepping back horrified*).—This view will be hidden!!

ENGINEER.—It is impossible to avoid it. Think of the size of the station.

DEPUTY.—What has that got to do with the view? I'm tired of your station.

ENGINEER.—But think of the passengers. . . .

DEPUTY.—Well, what about the passengers?

ENGINEER.—Then the question of transport?

DEPUTY.—Well, what about that? You engineers are simply amazing with your stations and your transport. The essential is, not the transport of passengers, nor yet of goods, understand, but the obstruction of the view; passengers we have always, but beautiful views are rare. Hang it all! if everybody listened to you there would soon be not a single view left in France, we should have nothing but stations, girders, and bridges, and other structures more or less ridiculous; a lot you care for views! . . . Fortunately, however, we have still a say in the matter there. I shall certainly not vote for your scheme.

THE plans of Mr. Wyndham's new theatre have been finally approved, and it is probable that the next few weeks will see a commencement made of the building, which, when completed, will be one of the most commodious of the West End playhouses.

A.A. COMPETITION FOR GOLF CLUB HOUSES.

THE number of competitors which the Architectural Association silver medal and prize of ten guineas has attracted this year is certainly above the average, and the same remark applies to the quality of the work. The subject chosen, a golf club house, was attractive in itself, and an excellent opportunity for the exercise of the picturesque and economic faculties of the student. The particulars were for an imaginary club containing 250 gentlemen and fifty ladies, with links near the sea coast. The result was to attract eight designs, all of which showed that their authors had expended careful study and thought upon their respective productions.

of architectural work, while the value of such efforts in stimulating self-reliance and invention can scarcely be over-rated.

The drawings on view at the rooms of the Association in Conduit Street were, as we have said, eight in number. At their head, as winner of the silver medal and prize, is Mr. H. I. Triggs, whose name, we believe, is becoming well known in connection with competitions of this and even of a more serious kind. He is closely followed by Mr. W. D. Clapham, and we propose to notice separately the drawings of these two gentlemen and their fellow competitors. Mr. H. Inigo Triggs shows a design remarkable for its care and forethought. He exhibits his gallantry no less than his professional skill in the manner in which he provides for the accommodation of the lady members, who have an entrance from a verandah and terrace, separated from their

been supplied with some degree of haste, are characteristically executed. We would especially select his water-colour drawing of the perspective, as showing the best points of the designer himself, as well as the advantages of the particular building.

The sub-committee to whom the award is entrusted can have had no easy task to decide between the first two competitors, but a closer examination of both designs removes any lingering doubt that its ultimate decision was correct.

Mr. W. D. Clapham, who proved such a closely-matched opponent, has been awarded honourable mention for his admirable design. Perhaps the point which told with the judges most in their decision was the fact that while Mr. Triggs has confined most of his important rooms to the ground floor, Mr. Clapham has occupied no less than three floors. His en-

A.A. GOLF CLUB HOUSES COMPETITION. BY L. G. BIRD.

The Association may congratulate itself on the establishment, on a sound basis, of a successful series of competitions which promises to attract an increased number of students, and shows a steady improvement in the standard which the young architect sets before him.

Before we pass to our pleasant task of describing and criticising the drawings, a word may be said as to the great value which attaches to competitions for students like the present. Whether the competition system be good or bad, it is a fact that an immense amount of professional work is thrown open to the body of architects by means of public competitions, and it can scarcely be amiss for the recruit just about to enter the battle to have borne his share in a mimic fight where the conditions of the contest are so nearly analogous to the more serious warfare. It cannot be doubted that any device which encourages the student to reproduce his own ideas rather than, as is too often the case, to copy the designs of his fellow men, will, if properly and wisely directed, raise the standard

clubroom. The chief entrance and hall are skilfully planned, the latter adjoining the dining-room, which can be reached from the ladies' quarters by another door. The dining-room would appear to be most effective, lighted partially by dormer windows. The kitchen and housekeeper's rooms are placed on the first floor, so that any smell or noise arising from cooking are prevented from reaching the dining-room. In the dressing-rooms, Mr. Triggs has, in the provisions as to seating accommodation, shown that the details as well as the general effect have received a due amount of care at his hands.

In his elevations, the prize-winner shows considerable breadth and boldness of treatment, and the whole is dignified and restful. He has carefully considered his skyline—an important factor which is too often neglected—and he has throughout avoided that unnecessary elaboration of detail which forms a formidable pitfall to the younger section of students.

Mr. Triggs' drawings, as a whole, though the finishing touches would appear to have

trance to the hall and staircase are capital, while a great advantage in his design is the separation of the household offices from the main building. It is noticeable, however, that he is prodigal of space in his provisions for passages and lobbies, while the accommodation for the professionals is relegated to the basement.

It is in his elevation that the author shows more particularly a distinct taste for the picturesque and unconventional, but dignity and harmony have been in no way sacrificed. The materials selected are, for the lower portion of the building, stone with rough-cast above, and for the roof, green Westmoreland slates. These form a combination remarkable for quiet colour, and the general result is original and distinctly effective.

A verandah runs round two sides of the house, simply treated, and is a valuable addition to the dignity of the design. We would finally commend the careful proportions of his windows, and indeed of all his design.

Mr. L. G. Bird is probably himself a golfer, for the practical details are worked out

A.A. COMPETITION. DESIGN FOR GOLF HOUSE. BY H. TANNER, JUN.

with an experienced hand. The dressing-room which he has provided for the gentlemen is nearly three times the size of their club-room, which would appear to us an immoderate allowance. The entrance seems wanting in illumination, but this could probably be remedied by top-lighting.

His elevations, if they fall short of the two designs which we have already considered, are not wanting in originality, but this has been acquired at a sacrifice of dignity and quietness of treatment. In a word, he has allowed his fancy to revel unrestrained, to the neglect of more important architectural considerations.

In the perspective his technical skill as a draughtsman is admirably exhibited, and proves to be of unusual merit; indeed, if mere drawing were in question, there is little doubt that he would be in a high position.

With the exception of the perspective, his drawings have a somewhat laboured effect, and are spotty in execution. He will probably discover that a really striking drawing can be obtained without the inclusion of anything unnecessary or superfluous.

Mr. C. A. Battie has formed his plan in one solid block, which has naturally led him into difficulties with his lighting and ventilating arrangements. These he has attempted to overcome by the use of skylights. Most of the requisite rooms are placed on the ground floor, but it seems to us an error of judgment to put the ladies' dressing-rooms and lavatories in the front of the building, while the gentlemen's club room, though well arranged, hardly gives sufficient space for such an important apartment. There is a restfulness in his elevation which is distinctly pleasing, while he has bestowed admirable care and skill in the well-finished scale drawings. In his perspective he has perhaps neglected the architectural features of his building in order to make an attractive picture—a fault, we may add, which he shares in common with many young architects.

Mr. H. Tanner, junr., has a somewhat extraordinary plan, based on the abuse of what is a sound idea. In dispensing with passages to the extent which he has, he appears to have overlooked the requirements of a club which is to include both ladies and gentlemen, and in practice his scheme would probably be seen to work awkwardly.

His elevations are very fair, showing slate roofs with large, projecting eaves, while his perspective drawing in ink is well above the average.

The fact that we regard this form of competition as so important and beneficial to students in general must be our excuse for omitting to do more than mention the other competitions which were simultaneously ex-

hibited; most noticeable those sent in for the measured drawings prize. The popular subject in this section seems to have been the pulpit of St. Nicholas Church, Deptford. Nor can we do more than mention the designs of gentlemen who adopted the pseudonyms of "Gradatim," "Eothen," and "I Strive," all of which show points of merit which, if wisely developed, should earn for their authors success in a later competition. The subject set for the next competition is, we understand, a convalescent home, which we sincerely hope will attract an even larger number of students. Upon intending competitors we cannot too strongly impress the fact that it is these competitions alone which give them the independence of invention and execution which cannot fail to prove of immense benefit in all the work which they are called upon to do. Of one thing they can be sure, that their drawings will receive most thorough examination at the hands of the judges, and we trust that the friendly criticisms which we offer may prove to be of some slight service to both the competitors and their fellow students.

CLAIM FOR TENANT RIGHT.

IT seems strange to hear of a claim for tenant right in the City of London, but such a claim has been made to the Court of Common Council on behalf of the tenants of premises belonging to the Corporation, and managed by the Bridge House Estates Committee, in Finsbury Circus and London Wall. With a view to increase its revenue, which has been considerably depleted by the expenditure on the Tower Bridge, it has decided to pull down the whole of the houses on the south side of Finsbury with the exception of three, together with the houses on the north side of London Wall, between Finsbury Pavement and Blomfield Street, and a number of houses in Finsbury Pavement and Blomfield Street, the leases of which will expire at Midsummer, 1899; the land is to be put up to auction and let on a building lease for eighty years, in five large blocks. The present tenants have presented a memorial to the Court of Common Council, stating that they have laid out large sums on these premises under the impression that the leases of the premises would be renewed, and that if the proposed scheme is carried out they will be driven from the locality and their business ruined. They therefore pray that the Council will not approve the scheme, but will re-let the premises at a rack rental and give the present tenants the preference on re-letting.

A PROPOSAL FOR CLASSIFYING BUILDERS' WORK.*

BY S. FLINT CLARKSON, F.R.I.B.A.

THE proposal is that classes, such as fair (A), good (B), best (C), shall be agreed upon. The proposal is made in the interests of employers, architects, and contractors. It will probably be about equally serviceable to all, as long as contract amounts are settled by competition tendering. Other systems besides competition may be tried with advantage; but, at present, the greater part of the work is allotted in that method, which seems likely to be kept to also in the immediate future. Drawings, specifications, quantities, competitive estimates, clerks of works, and other superintendence, and 5 per cent. are the recognised machinery—by which an employer gets exactly what he ought to wish for, and is assured that he is to pay no more than the market price for it. We propose only a minor improvement in the regular machinery. Let us see why it seems desirable. Gradation in quality is as legitimate in builders' work as it is in anything. People know this very well, though they may grumble when gradation takes too wide a range. Proportion is not simply securing the right relation of function and apparent importance. Thorough proportion requires that materials and workmanship shall be varied judiciously by the architect in different buildings, and in different parts of the same building.

BLUNDERS AND WILD TENDERING

will account for anything, but there will be smiles, and notes of admiration also, for less outrageous disparities—which might often be traced to misapprehension as to the class of work required. Between work of the highest class and fair work without pretension to excellence there is a wide distance. From work ranking with the best of all time we reach by proper stages the most ordinary work—sound and serviceable, though wanting in fineness of quality and finish; and thence the déclassés may be reached—found in building as in life. Certain contractors lay themselves out for work of a certain kind, selecting workpeople and materials accordingly—and anything out of the usual course meets with less cordial welcome, and is sometimes not competed for with eagerness. The selection of such imperfectly sympathetic contractors accounts for other bad tenders, as also the selection of people who differ a good deal in the class of their business. Classification

* A paper read before the Architectural Association on Friday night. Mr. H. D. Searles-Wood's paper on "Some New Materials for Use in Building," read at the same meeting, will appear in our next issue.

of work will not help us over all difficulties, but it may be of service in many. Any decent names of classes will prove better than any others as soon as they are generally accepted. Naming of sub-classes would cause little trouble; everyone could do it for himself, or

DEFINITIONS MIGHT BE AGREED UPON

from time to time, and then used in general practice. There are good precedents. Ships sort themselves into classes. "Best best" is in general use. There are degrees of merit in timber and other trades; it is, in fact, difficult to find a trade which does not supply precedents. "The Act to facilitate the granting of certain leases" (8 and 9 Vic., c. 124) has supplied for over fifty years specimens of concise forms having much meaning. Fair, good, best; Classes 1, 2, 3; ordinary, average, superior; and many other words or forms may suggest themselves, doubtless all with show of reason. There must naturally be two extremes and a mean. The worst work with which an architect could be connected would be at one end, first-rate monumental work at the other, and something better than the one and less excellent than the other between. Let us try:—CLASS A.—Nothing special anywhere; the most current things in all trades. CLASS B.—Something below the best; special design, adaptation, &c., in the more important parts of the building; good execution, but a keen regard for cost. CLASS C.—Excellence in materials and execution; the most finished work of the time; for the best public and private buildings. Objectors will hint that some contractors might try to supply the least costly work of its Class—in fact, the worst work which the architect would pass—instead of what was intended; but the same sort of contractors do that sort of thing

now. It will also be suggested that general specifications are not effective, and that classification might be interpreted by some architects as an encouragement to undue brevity. "The building is to belong to Class B, and is to be completed in all respects accordingly," is the pithiness which is feared; but the passion for detail will keep most architects on the old lines. Old friends, in new clothing, always come to the front to hinder changes; but this brave self-devotion does not entitle them to special mention.

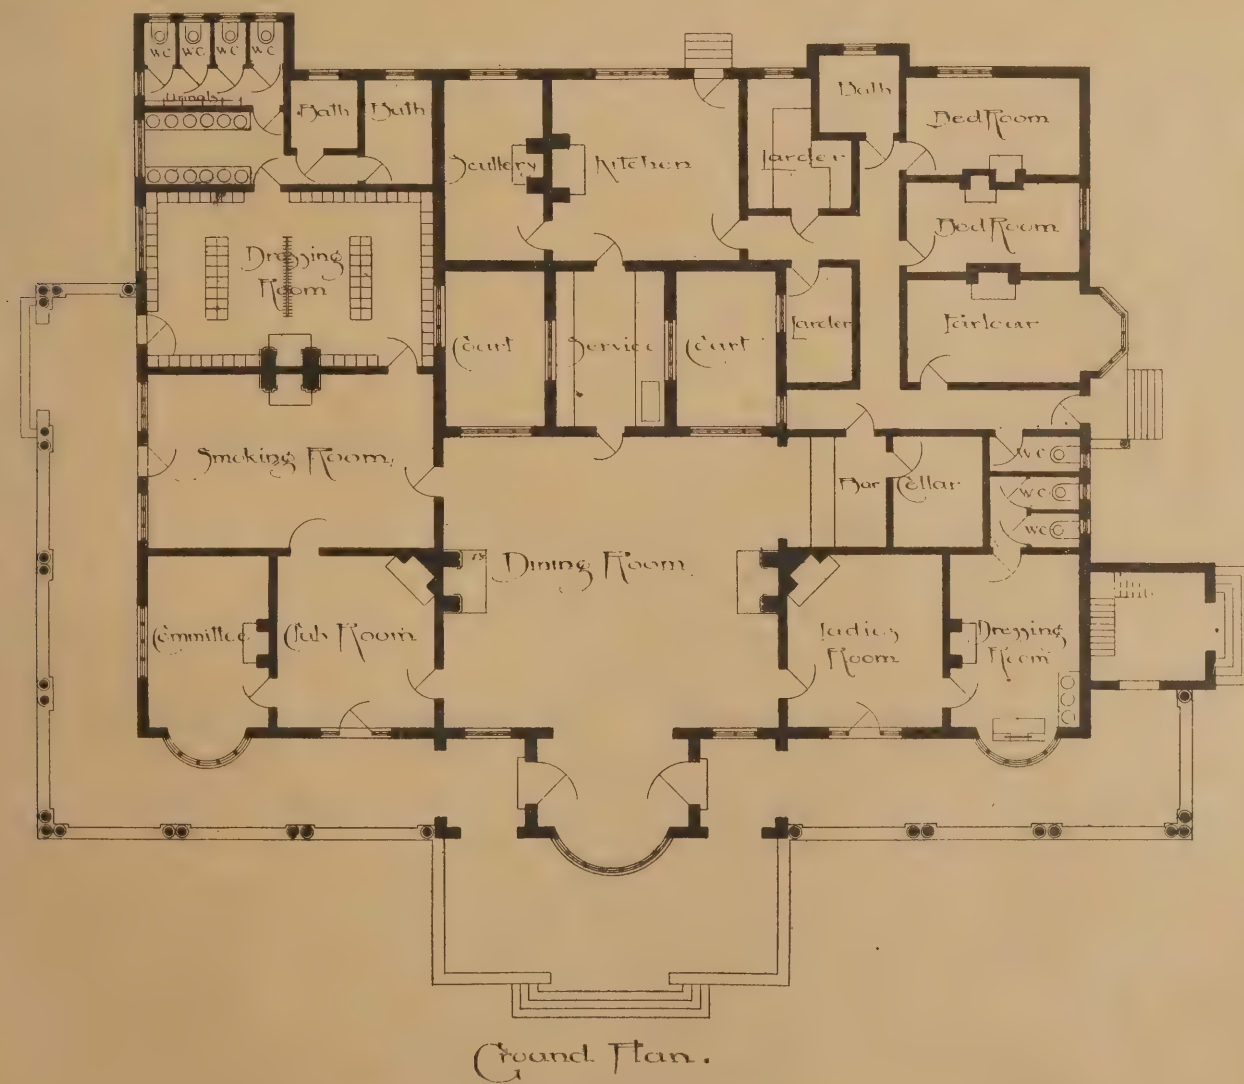

HURRIED, SLOVENLY, AND GENERALLY INFERIOR SPECIFICATIONS

(and drawings) should not increase in number, as they are serious evils; but it does not follow that anything which might prevent an inferior specification from failing hopelessly would necessarily be an evil. Hopeless failure results when everything proves adverse; but purses pleasantly full, well-occupied lives, and a healthy appetite for compromise enable many meagre specifications to keep their virtue. Sometimes they are even (in retrospect) looked upon as blessings in disguise. Some employers appreciate low tenders; the architect who has obtained so much for so little is spoken of as skilful and economical; and the contractor, if treated with judicious liberality, does not object to posing as a benefactor who works more cheaply than other people. Contractors are sometimes informed, in suitable language, that they are not to add a large sum per page of specification to their tenders, because the specification seems unusually big, and so much per drawing also, because some of the detail drawings, which will form part of the contract, have been prepared in good time instead of later on. Shrewd employers have the same thing in view when they ask whether a specification of

150 pages is really necessary, and hint that explanations about moderation in quality to the builders submitting tenders should be very precise. The mention of a recognised class of work at the beginning of a specification need not lead to the omission of a word from the most thorough specification. The proposed prefatory words would, however, throw a strong light upon every detail. There are pieces of work which fall to every one of us, where time is so all important that delay of a few days in starting the work may lead to serious reflections on the

ENERGY AND RESOURCE OF THE ARCHITECT.

These are, happily, exceptional cases, though apparently on the increase, and should not influence ordinary practice conducted under better conditions. But an architect thus pressed for time, after describing all special items and throwing the rest of the work into one of the proposed classes, might feel solid ground under his feet in carrying through a contract. The classification would frequently be, in effect, a record of the result of negotiations; such a record as ought to be in writing, in view of the uncertain future—for general understandings are frequently misunderstood, memory fails, or ill-will and bad blood distort it, and much else; or parties die and give no sign. A specification may call, in conventional terms, for the best materials and labour of their respective kinds, and describe the respective kinds, and still leave a good deal to the discretion of the architect. People who can get on with very imperfect specifications manage to struggle through with more perfect ones. Difficulties arise when a contractor tries to supply a good deal less, and an employer, at the same time, asks for a good deal more than the discreet architect considers that the con-

A.A. COMPETITION. DESIGN FOR GOLF CLUB HOUSE. BY C. A. BATTIE.

tract provides. The employer, who anxiously suggested explanations to the contractors as to a moderate sum and a good deal of work for it, may find that events before the contract was signed, after a busy interval, become more and more shadowy. He then prayed, as a favour, for

MEDIOCRE WORK;

now he and his friends read the specification with much care, and interpret conventional phrases literally and liberally—and there is perhaps assistance for them from legal minds. If the contract made it quite clear that work of Class A was intended, such an employer might be disposed to leave things alone. An architect selected because he has a reputation for thoroughness and work of high quality; an appeal by the employer for the mildest treatment such a reputation will permit; resolute bargaining and a low contract sum; and in the sequel a tender solicitude for the keeping up of the architect's reputation—might thus, in the future, be treated by a playwright as one of the dramatic situations possible only in the elder days. It happens too frequently that Fate rewards a fair-minded architect with more than adequate retribution for other people's faults. The same post may bring him remonstrances both from contractors and employers. One contractor cannot find in the one-eighth scale drawings several mouldings for which he has received full sizes; another finds too many check grooves and tongues in the joinery, and unlooked-for stoolings in stonework; another suggests vigorous reductions (or extras), and something nearer a freeman's liberty as to materials. Employers, on the other hand, say their say. Pleasant-minded architects have remarked that, if there is an ambient atmosphere of imperfect satisfaction while the works are in progress, there will not be very much cause for grumbling at the end. But would not things go more smoothly in many cases if everybody had the help of the proposed classification? It should be added that no minor change will prove a panacea for all building ills. A trial of classification is only a modest little practical proposal. It could be easily introduced, and should be generally accepted in a short time.—The President, in opening the discussion, said at first sight Mr. Clarkson's proposal might seem a simple one, but the more they looked

into it the more difficult it became to realise it in a practicable way. It was easy, in looking at a finished building, to classify it in accordance with Mr. Clarkson's proposals, but when they were starting to build they could not put one of the classified models before them and say that was the class of building to be erected. It seemed to him that there would be great difficulty in definition. After all, a building was made up of parts and details, and the different degrees of quality were matters of specification. He took it that it was more a question of difference in the quality of materials than difference in workmanship that went to make up the classification, and it seemed to him that they might have a difficulty with builders who, for their reputation's sake, would say: "I only build in one class; my work is only one class of work." Builders did say that, and it seemed reasonable that they should. If it were represented to him that the client did not want to spend much money, the builder would think perhaps that it was

BENEATH HIS REPUTATION

to build anything but the best. The speaker could imagine that the best class of builders would have no share in the proposed system. But supposing they were anxious to adopt some system of classification, would not the actual work of classifying be very difficult? He did not see why a building should not come within two or three classes instead of only one; seeing it was principally a question of material, they might use inferior goods only in parts, and that, of course, would interfere with the classes. It was more a question for builders to discuss and determine than for architects. They, as architects, had generally been accustomed to specify that all the work and materials should be of the best kind, but they knew perfectly well that that meant nothing unless they entered more definite descriptions and saw that the work was carried out accordingly. It seemed to him that with a good and clear specification and some control over the materials they had everything required in securing the proper execution of the work in hand.—Mr. W. H. Seth-Smith said there was something very fresh in Mr. Clarkson's proposal, which warranted them in asking time to consider his suggestions. He (the speaker) was, however, rather inclined to agree with the President that the thing would

be very difficult to work, though he differed with him when he said that the matter was more one of materials than workmanship. With the present trades' union regulations a good workman received just the same wages as an indifferent one, and they would have to pay the same uniform rate of wages in each class. After all,

TWO-THIRDS OF THE COST OF A BUILDING

went in workmanship and not in materials, and that was where one difficulty would arise. He thought the proposal would be especially valuable as applied to architects and clients, for the latter might then be made to understand that in cases where a lot of work was required for a small price, the work would not be in Class C. The mistake often made in carrying out this class of work was in endeavouring to introduce too much detail; it was more satisfactory and not less so when omitted.—Mr. Leaning said the question was one which had been an under-current in the minds of architects for many years. It was suggested that the establishment of a series of classes would dispel the hitherto unspoken element in buildings, and by so doing eliminate the margin now allowed. He thought it would be worth a few moments to examine what it was which constituted the quality of a building. The first essential point was the efficiency of the several parts of the building, such as the thickness of the walls, the scantling of the timber, &c. The second factor was the style and finish of the workmanship. The classification could only be made to apply to the quality of the materials and workmanship, and not to drawing of details. How was it that the speculating builder could produce a house at so much less cost than an architect? Largely, he maintained, by economies effected in such matters as the thickness of walls, scantling of timbers, proportion of concrete,

THE USE OF STOCK MOULDINGS

instead of detail mouldings, the use of zinc instead of lead, and so on. But as regards the materials, the architect was able, without much trouble, to bind the builder hand and foot by specifying the maker of his facing bricks, lime, and cement, the maker of his glazed bricks and rubbers; what pit his sand shall come from, the maker of his iron and steel, the quarry of his slates, and the weight of his lead and zinc. The chief difficulty was as to

timber, and insistence on well-known brands seemed the only safe guide. The relative value between the best timber on the market and fourths or fifths, which was what a speculating builder would probably use, represented in the construction of a £2,000 house something like £50. It was clear, he maintained, that the proportion of work in building which could not be specified was very small. He thought it would have been better had the proposal taken the form of three or four model specifications which might be circulated among architects purely for themselves, defining what were the things to use for certain qualities of work, and how far down they might go in the scale without sacrificing good taste. He maintained, however, that by the present system it was quite possible, and, indeed, many architects succeeded in producing work of the best description, and, when necessary, in economising without sacrificing good construction and good taste.—Mr. G. Douglas Mathews thought Mr. Clarkson's suggestion was a valuable one, but not of such simple practicability as he made out. His proposal would, no doubt, if carried out,

CREATE A REVOLUTION.

There was no doubt that at the present time builders quite understood the different classes of work themselves, and it was necessary that the proposed classification should be put so clearly that there could be no doubt whatever in the minds of any party concerned to what Class the building belonged. Under the present system all doubt as to the class of building to be erected would be dispelled by a note at the top of the specification that the materials must all be of the best quality, and that nothing else would pass muster. He was afraid the classification as proposed by Mr. Clarkson would not tend to clear the air, but on the contrary, would give rise to considerable difficulty. He confessed that the paper was not so clear as he could have hoped, but yet he had not the least doubt that if Mr. Clarkson put his suggestions in more definite form the Practice Committee of the Institute would be pleased to hear it, and see if the matter was capable

of being carried out.—Mr. H. Lovegrove asked if it was not a fact that the builders were very much classified at present. If they were going to build a large common building in the suburbs they would not ask the best firms to tender, or on the other hand, if they were erecting a first-class building in the City, they would scarcely go to the suburbs in search of tenders, so that it seemed to him that the builders themselves were at present classified. Supposing that when a building in Class A had been finished, the architect discovered a glaring opening in the mouldings and sent for the builder, could not the latter reasonably produce the specification and retort that the work was classified to be in the lowest quality? The whole question required careful consideration, and they were indebted to Mr. Clarkson for having brought the matter forward.—Mr. J. Osborne Smith thought that the builder, if supplied with a properly drawn out specification and drawings, would not make any mistake as to the class of building required. He thought the present system was a clearer method than a system of classification would be.—Mr. Max Clark did not see what possible object would be obtained by the proposed classification. He thought they ought to build as well and as soundly the dwellings of the rich as of the poor. Therefore, it seemed to him that it was principally the ornate quality and elaborateness of the workmanship with which they had to deal in economising. It was no use discussing this question in the abstract; the paper itself did not enlighten on in the slightest degree, and before the matter was disposed of it should be reduced to a little more definite shape.—The Chairman summed up the discussion, and in acknowledging a vote of thanks Mr. Clarkson said he was not surprised that so many of the speakers pointed out the difficulties standing in the way of his proposal. That it was a matter of difficulty no one could fail to recognise; he was surprised, however, that his suggestion had been so little recognised as desirable. However, he did not propose to drop the subject, believing it was capable of fuller presentation.

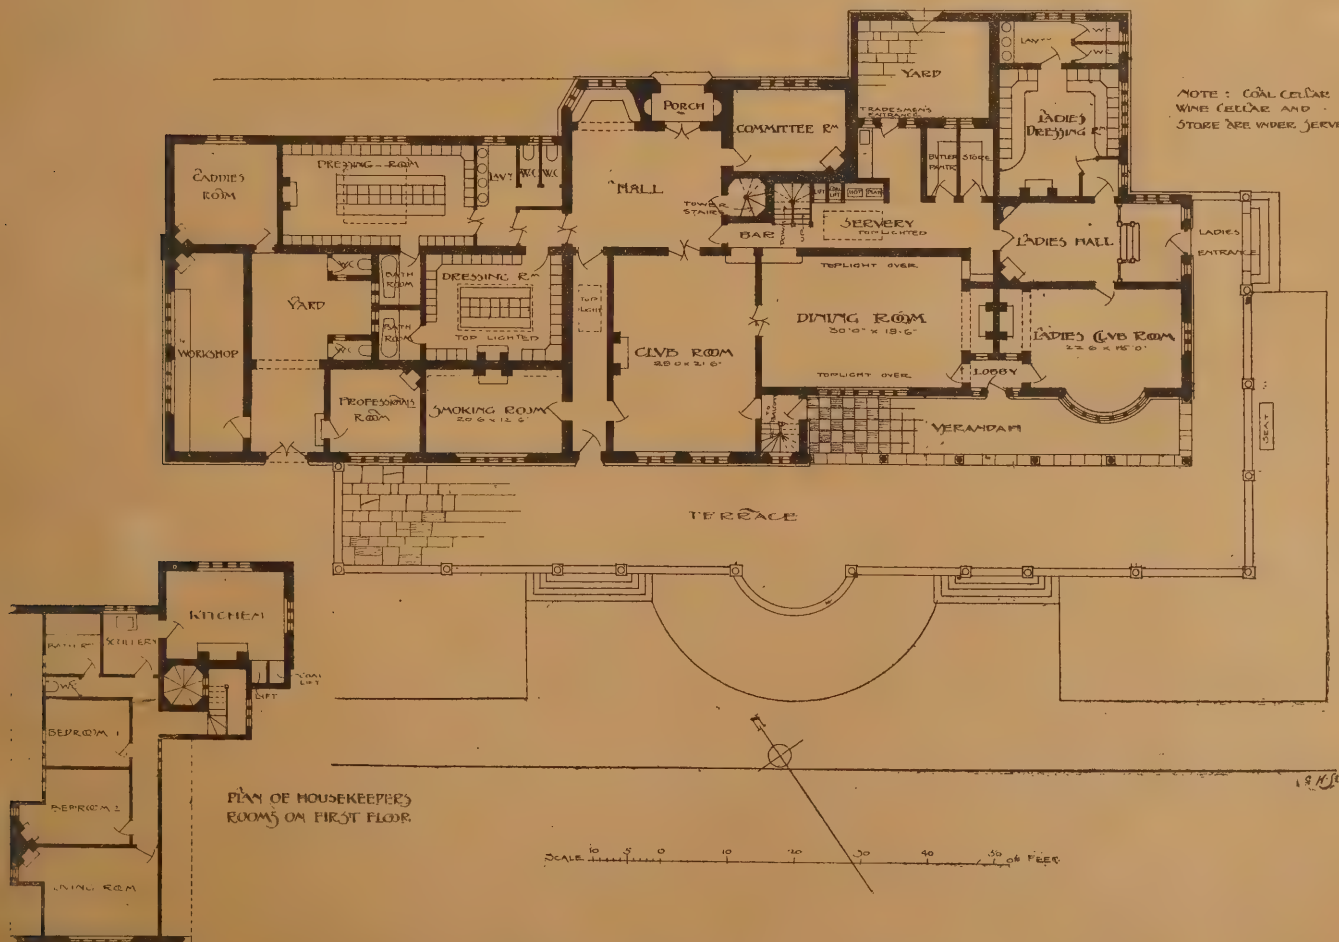

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
November 10th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ST. PATRICK'S CATHEDRAL, Melbourne, has just been consecrated. It has taken forty years to build, and has cost £240,000. A sum of £7000 was contributed during the day of consecration.

THE Royal vault at Windsor, where the remains of the Duchess of Teck have been deposited, was built by George III., and intended to contain eighty-one bodies. The chalk rock beneath the Chapel was excavated to the depth of 15ft., the vault being of the same dimensions as the building above it—70ft. long by 28ft. wide. It has a vaulted stone roof, resting on massive octagonal columns, which also support the ranges of stone shelves on which, as well as on the twelve stone tables at the east end and in the centre, the coffins are placed. Here rest the remains of twenty members of the Royal Family. At the east end of the vault are the coffins of George III. and Queen Charlotte. The late Duke of York, who died in 1827, lies

A.A. COMPETITION. PRIZE PLAN, BY H. I. TRIGGS.

in the north-east corner of the crypt. The coffins of George IV., William IV., Queen Adelaide, Princess Charlotte and her child, the Duke of Kent, Prince Harold of Schleswig-Holstein, the infant son of Prince and Princess Christian, the King of Hanover and Princess Victoria, infant daughter of Princess Frederica, rest upon the stone tables in the middle, while those of Princess Amelia and Augusta, the Duchess of Brunswick and others are also in the vault.

INTERNATIONALISM in works of Art, if it has not extended to England or to the purchase of

English works of Art by foreign Governments, is being actively pursued abroad. The German Government has bought for the National Gallery works by the French artists, Cazin and Sisley, and the Italian Government works by Julien Dupré and Alfred Smith—French and American respectively.

THE Japanese are contemplating the building of a railway bridge across the Strait of Shimonoseki, which will enable passengers to go without changing carriages from the extreme south of Kinsin to the north of the

mainland. With adverse conditions to surmount, the bridge, if constructed, will be the most wonderful in the world, not excepting the Forth Bridge. But if it is humanly possible, the Japanese engineers are not likely to be balked of success. Among the 2000 odd members of their Institute are some of the most competent men to be found in any country. The arrangements for the theoretical training of engineers, and indeed for technical experts generally, are more complete in Japan than in England, and the best men invariably acquire the best practical experience abroad.

A GOLF CLUB HOUSE

A.A. COMPETITION FOR GOLF CLUB HOUSES. HON. MENTION PLAN. BY W. D., CLAPHAM.

SIR J. WOLFE BARRY, President of the Institution of Civil Engineers, was the principal guest at the monthly house dinner of the Camera Club, 28, Charing Cross Road, W.C., and in responding to the toast of "Our Guests," proposed by the chairman, spoke of the relationship existing between photography and engineering, and instanced several ways in which he had found photography of assistance to him in engineering works. In the construction of underground railways, for instance, he had, by means of photographs taken before the commencement of the work, been able to prove that cracks in buildings which were said to have been caused by the construction of the railways existed prior to their inception. He began the practice of photographing buildings along the line of route of such railways thirty years ago, and it had proved to be of the greatest assistance. The uses and value of photography were, indeed, increasing every year. He, who came from an architectural family, had always been able to realise its intense value in the Art of Architecture.

THE extensive building operations which are taking place round the south-western corner of Lincoln's Inn Fields are completely changing the aspect of the neighbourhood. Where Portugal Street and Portsmouth Street meet there still stands the quaint old house with the legend painted on the front that Dickens has immortalised by making it the home of Little Nell. The "Old Black Jack" tavern was pulled down last year. The whole place reeked with dirt, filth, and uncleanness, and was a danger to London at large. Although some time must elapse before the clearance is made complete, there is no question as to the improvement in more senses than one.

A CURIOUS exhibition of artistic convict work has recently been held in New York. The exhibits reached a high level of excellence, and included examples of wood-carving, articles of furniture, and some fine plaster casts, the latter of which was made by a young Italian convict for the prison chapel. The man under whose direction all the Art work has been done is a convict, who, in his own profession as an architect, was able to earn from £1000 to £2000 a year by the exercise of his profession. There is a regular Art "School of Design," as it is called, in Sing Sing Prison, and the "students" are not only taught freehand and sketching from models, but wood-carving, modelling in clay, and colour work, while there is also a course in designing. The principal teacher in the Art school is a convict who was a skilful furniture designer, and his assistant was an Art student before he entered the prison on conviction in that highly-specialised branch of artistic imitation—forgery.

A CORRESPONDENT asks whether it is not possible for the authorities charged with the maintenance of the Strand and the Thames Embankment to arrange that both of these thoroughfares should not be under repair at the same moment. While one is "up" the other should be kept absolutely free from obstruction to traffic, thus preserving at least one unimpeded artery from the City to the West End. At present the system adopted is to have repairs and alterations effected bit by bit on each at the same time, the result being that carriages are compelled to "dodge" down side streets every now and again, with consequent waste of time and loss of temper to the occupants.

THERE is now a favourable opportunity for widening Southampton Row, Holborn, owing to the leases of property in the neighbourhood running out and the freeholder, in the person of the Duke of Bedford, being prepared to negotiate with the Council for the sale of his freehold interest. Southampton Row, besides accommodating the general through traffic from the north of London, forms the principal outlet for the traffic southwards from Euston, St. Pancras, and King's Cross railway stations. The Improvements Com-

A.A. COMPETITION FOR GOLF CLUB HOUSE. BY W. D. CLAPHAM.

mittee of the Council asks to be empowered to proceed with the work of widening the thoroughfare between High Holborn and Theobalds Road, the estimated cost being £149,500.

WITH a view to increase the width of the Lower Richmond Road, the Star and Garter, at Putney, just above the bridge, is to be demolished shortly. The Lower Richmond Road at this point is not only extremely narrow—it is less than 15ft. in width—but close to the famous inn mentioned there is a dangerous bend, which has been the scene of a number of accidents. As the thoroughfare is a main one, leading directly to the Ranelagh Club, the project of improving it has been the subject of a numerous signed petition. The Wandsworth and Putney officials at once formulated plans, which have been approved by the London County Council, to increase the width of the roadway to 45ft., and, by straightening it just beyond the Star and Garter, obviate the danger to the occupants of traps and bicycle riders. The inn dates back over 300 years. Its low taproom, its quaint bar parlours, and its pleasant balconies linger in the memory; and until the embankment was built in, and a lower road along the riverside constructed, flights of steps ran from the bar right down to the water. The old house, standing as it does within a stone's throw of the Leander, the Thames, and the London

Rowing Clubs' boat houses, has innumerable boating associations. Nearly all the champion oarsmen of other days have trained here, and not long since the Cambridge crew made this establishment its headquarters. Mr. Philip Davis, the proprietor, intends to erect a larger and improved Star and Garter on the site of the present one. The new building is to be of granite and white stone. The plans contemplate a great house, with rows of balconies, and a carriage drive, while the increased space for the roadway will be secured by utilising the site of the present kitchens, which in the new structure will have a place at the top of the building. There will be a dining hall capable of seating 300 people, a band-stand and fountains, and a bijou opera house. A little higher up the river on the other side another ancient licensed landmark is about to disappear. The old Crab Tree beerhouse, which has been so far preserved from the encroachments of the nineteenth century by the fact that it stands in the midst of an impenetrable forest of market gardens, has succumbed at last to the tendencies of the times. The old house is shortly to be pulled down to make way for a modern brass and mirror pub.

ONE hundred million francs (£4,000,000 sterling), is the sum which has been set apart to defray the expenses of the Paris Exhibition of 1900. According to the Figaro,

twenty-one and a half million francs will be the cost of the two palaces in the Champs Elysées, those in the Champ de Mars costing eighteen millions, on the Esplanade des Invalides five millions, and those on the quays one million and a half. The bridges across the Seine will cost five millions, of which the Pont d'Alexandre III. will take the greater part. The mechanical and electrical service will use up 6,750,000 francs. To the circular railway will be appropriated a million and a half. Illuminations and lighting will take 800,000 francs, and fountains and decorations of the gardens 1,200,000 francs.

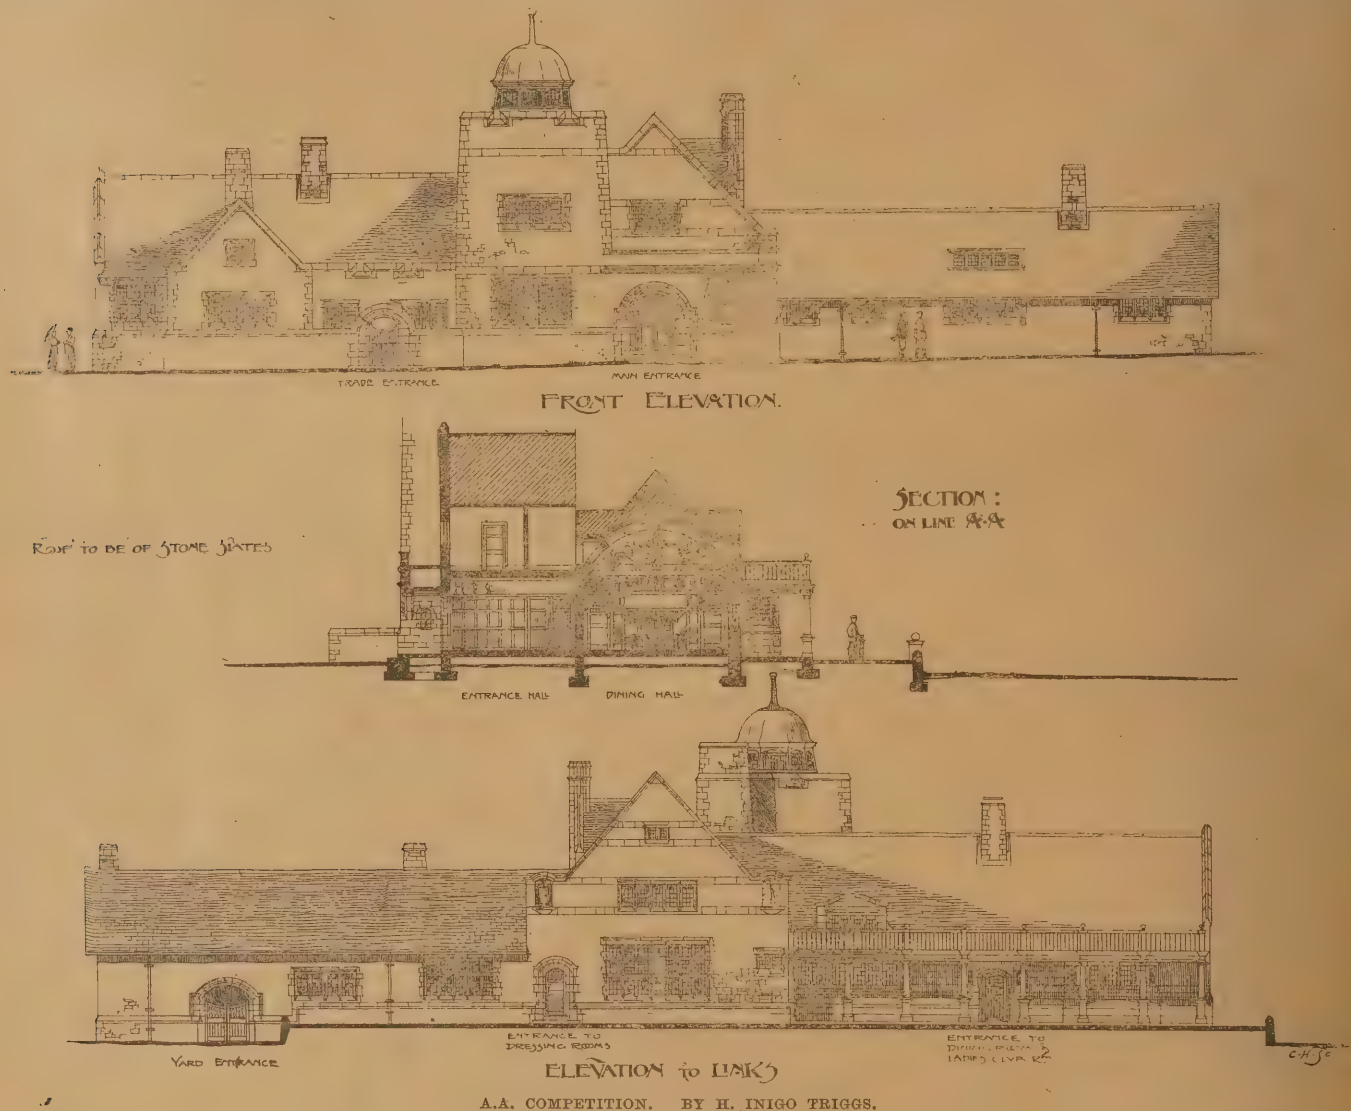

HIS MAJESTY the King of Hungary is particularly desirous that Hungary should be represented in a worthy manner at the Paris Exhibition of 1900, and has given instructions that the new wings of the ancient Castle of Buda, now in course of construction, shall be

painting for the Guildhall, and this bids fair to be a work of real importance.

HERR UHDE's picture of "The Ascension," which was purchased by the Bavarian Government at the recent Munich Exhibition for the considerable sum of £1300, has centred round it a vast amount of controversy. The Minister of Public Morals has raised objection to the lack of divinity in the principal figure, and the artist is said to have admitted this and offered to repaint it. The committee which controls the museum has to decide whether or no this shall be done.

THE Société Nationale des Beaux Arts—a society founded in 1890 on the schism in the Old Salon, and which has since held its exhibitions under the better-known name of the "Salon du Champ de Mars"—has determined upon an act which will apparently close the

Much satisfaction has been given to residents in Brighton by the announcement that Sir Edward Sassoon has presented to the municipality, for erection in one of the public parks, five allegorical figures, representing Night, Morning, Truth, Welcome, and Fidelity. The figures, which are 8ft. in height, previously formed part of the ornamentation of Sir Edward's new house in Park Lane, the mansion erected by the late Mr. Barnato. They stood on the balcony facing Stanhope Street, and are the work of Mr. Gilbert Seale, to whom Mr. Barnato gave a commission for them almost exactly twelve months ago. Sir Edward, on acquiring the mansion, decided on modifying some of the architectural details, so as to bring them more into accord with his own taste. These five figures were among the features of the building that he considered might be put to other uses. He also offered the Corporation a group of carved recumbent

proceeded with in haste, and this work generally completed as soon as possible, as it is his special wish that a reproduction, the full size of the original of St. Stephen's Hall (built in the early Roman style), with its entire interior decoration and furniture, should be shown in the Hungarian Section of the Exhibition. This section will also contain numerous historic and Art treasures which were exhibited at the Hungarian Millennial Exhibition last year.

THIS week, the Lord Mayor is to unveil Mr. Solomon J. Solomon's wall painting of "Charles I. at Guildhall," the third of the series of decorations for the Royal Exchange; and before long other canvases by prominent living painters will be put in position in the same building. Mr. A. Gow, too, is making rapid progress with the picture of the Thanksgiving Service on Jubilee day, which he is

doors to any chance of reconciliation between it and the older body. It is announced that it has arranged with the city of Paris to lease a large space of ground at the Porte du Bois de Boulogne, and close to its most frequented entrance, and thereon it will build a palace which will be ready for the Exhibition of 1898—that is, in six months.

THERE are one or two passages in Tennyson's biography which deserve to be noted from their connection with Art. For instance, we have him writing concerning Ruskin in 1844: "Another book that I long to see is that on the superiority of the modern painters to the old ones, and the greatness of Turner as an artist—by an Oxford undergraduate, I think. I do not much wish to buy it; it may be dear. Perhaps you could borrow it from Rogers" (the poet). "I saw it lying on his table."

figures, then in site over the main entrance to the mansion, but which he had decided to remove from that position in the course of the other alterations to which the stonework is to be subjected. The figures have since been lowered from their situations on the balcony, but remain for a time at Park Lane until arrangements for re-erecting them in Brighton can be completed. As it is advisable not to subject them to more risk of damage than is absolutely necessary, it is considered that the best course is to leave them where they are until the pedestals required for them have been provided and placed in position. Upon the character of these pedestals the committee will pay the sculptor the compliment of asking his opinion. Two of the figures will be placed in the Northern Garden, and three—probably Night, Morning, and Fidelity—in the Southern Garden.

SUPPLEMENT.

NOVEMBER 10TH, 1897.

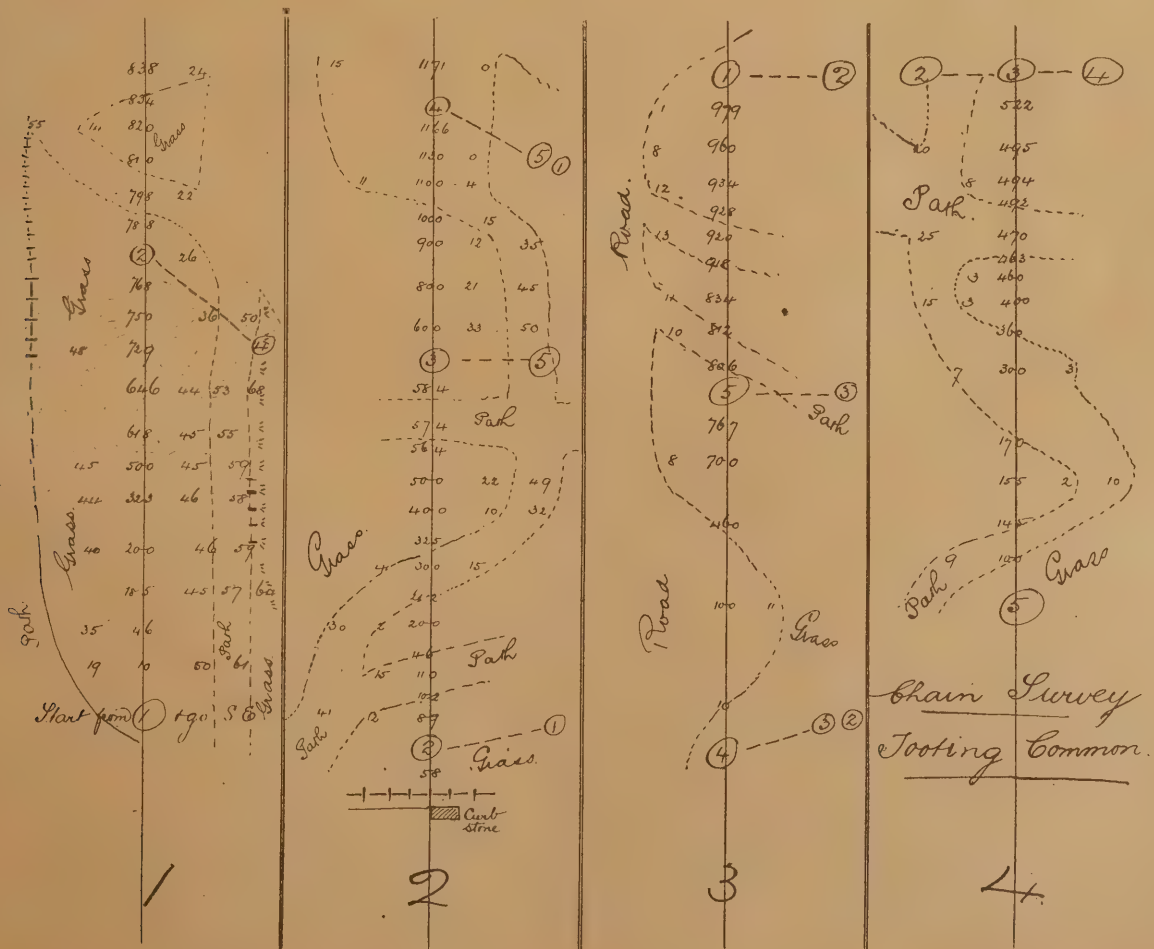

The Single Line Field Book.

BY G. A. T. MIDDLETON, A.R.I.B.A.

THERE is a constant contention amongst surveyors as to the respective advantages of the single and double line field book, and while a great many now use the single line, it is somewhat unfortunate that the principal instrument-makers do not sell a book so ruled. Its chief advantage is that it enables the sketching to be more continuous and clear; while the advocates for the double line say that it does not keep the chain readings sufficiently distinct from the off-sets. This may be the case with an indifferent or careless draughtsman, but anyone who values a neat book would keep his figures as dis-

tinct upon the one system as upon the other, and would certainly appreciate the extra space at liberty for sketching on either side of his main line. Where the double line is used, many more conventionalities have to be adopted than for single lines. When boundaries cross the chain, for instance, it is necessary to break the sketch, which the accompanying drawing will show to be continuous in the single line book. Similarly, when a station is reached, it is possible, with the single line book, to show it in its position on the line, with the other chain lines branching from it approximatively in their correct directions. Of course, in both books the entries are commenced at the bottom of each page, and the off-sets are entered to right and left as they occur, and a second line is never commenced upon the same page as the first, it being wiser to

waste paper than to confuse a survey. Similarly all entries in the field book are made on the near side of the object to which they relate. Thus, on page 1 the entry of 768 on the chain line represents the number of links between Station 1 and Station 2, while 788 is the number of links from Station 1 to the near side of the crossing path. Similarly on page 2 number 564 represents the distance in links of the near side of path from Station 2, and 574 the distance of the further side of path, 584 being the distance of Station 3. The same thing is done with the off-sets. On page 1 there are three off-sets at a distance of ten links on chain line from Station 1. There is an off-set of nineteen links on the left to edge of path, while on the right there is an off-set of fifty links to the near side of path, and one of sixty-one to the further side, all these being measured from the chain line.

FILTER PRESSES FOR SEWAGE SLUDGE.*

By JAMES CROLL.

(Continued from page 241.)

IN those filter presses first put down the feed passages are 3in. diameter, whereas those of the later presses are 4in. diameter. This was arranged as a partial preventative to the blockage of the feed passages, and it has been found very valuable in that respect. The drainage surfaces of the plates are not pyramid pattern, but simply grooved vertically, and the bevel edge at the rim is carried inward 2½in., thus avoiding sharp angles, and consequently the excessive wear and tear of the cloths which took place in the presses first erected, the bevel being 1 in 3.

The projections or bosses on the surface of the plates are also made with an easy taper for the same purpose. The opening and closing gear is also of different design, and consists of a 4in. screw working in a screw bush, 8in. long, the power for turning being obtained from a worm and worm wheel worked by hand from a capstan wheel 2ft. 6in. diameter. Although this gear is not more powerful or quicker in its action than the other it takes up less space, and was adopted so as to avoid altering the roof timbers of the building.

When the additional plant was erected, provision was made for removing the steam cylinders and pump end of one of the forcing engines, and providing two larger steam cylinders and two double acting air compressing cylinders, the other parts of the engine remaining the same. The steam cylinders are 8in. diameter, and 12in. stroke, and the air cylinders 7in. diameter, and 12in. stroke, jacketed with water in circulation. The pistons are of the buffer type, with springs so as to avoid clearance at each end of the stroke. The valve boxes are cast on the cylinder covers, and are provided with a quick opening and closing arrangement for access to the valves, which are of aluminium bronze, and of sufficient area to allow of a low lift. In the valve arrangement each end of each cylinder is separately connected to the delivery main, and is provided with stop valves, so that either end can be cut off and the valve cleaned or replaced without stopping the engine. The cylinders can be worked single acting if desired, and by this means a high speed can be maintained, the whole arrangement being such as to give the highest efficiency.

The air storage receiver is made of ½in. mild steel plates rivetted together. It is 4ft. 6in. diameter and 12ft. long internally, and is provided with a safety valve, pressure gauge, and a dip pipe for the removal of condensed water. The sludge rams are of cast-iron, with hemispherical ends, and in three pieces with flanged joints bolted together. It is 5ft. diameter and 9ft. 6in. long internally, and is provided with a 6in. dip pipe and all the necessary valves and connections. All the stop valves in connection with the sludge main are

* A paper read at a meeting of the Society of Engineers.

Chain Survey.
Taking Common.

of the plunger type where they can be applied.

Before describing the method of working the foregoing plant, it may be desirable to mention that the sewage, before being treated, is passed through three screens, one of 1in. and two of ½in. mesh. The chemicals used for precipitation are lime and sulphate of alumina. The sewage is collected on the continuous flow system, the tanks being cleared about once in each week. For this purpose a floating arm and valve is provided, which will only permit of drawing the water down to within 4in. or 6in. of the top of the sludge, the whole of which is swept into the sludge reservoir together with the sludge, where the solids readily subside.

The water is drawn off the top by means of the skimmer already described, and is conveyed back to the untreated sewage chamber and mixed with the crude sewage as it enters the works. The sludge is raised from the reservoir by the lift pumps into the mixing tanks. Originally the suction pipe of the lift pump was placed in the centre of the pit, but it was found that the supernatant water flowed to that point and filled up the cavity made by the removal of the sludge, and had to be pumped up and forced through the presses

before a further supply of sludge could be obtained, causing a considerable delay in pressing, besides the extra wear and tear of the filter cloths. To obviate this, the suction pipe was extended to a point near the end of the pit, so that when the pump is at work the water flows to the suction pipe as before, and is readily taken off by the skimmer, which is situated near that point.

The following is the method of working the plant which is shown in Figs. 7 and 8:—The sludge is raised from the reservoir to the mixing tanks by the lift pumps. A proportion of lime varying from 3½ to 5 per cent. to the ton of pressed cake is slaked in the lime mixer and run into the mixing tanks. A jet of air from the single acting air-pump is admitted at the bottom of the tank, and the action of the air passing upwards thoroughly mixes the lime and sludge together. If it is desired to utilise the force pump system a valve is opened, and the limed sludge is conveyed through a 4in. pipe to the force pump, by which it is forced direct into the presses.

When it is desired to utilize the air pressure system, the sludge is raised to the mixing tanks and limed in the same manner as for the other system, and conveyed through a 6in. pipe to either of the rams. When the ram is

FIG. 7

charged and the necessary valves adjusted, compressed air from the storage vessel is admitted to the top and the mass is forced up the dip pipe into the filter press. Each ram when full contains a sufficient quantity of wet sludge to charge one press. While one is under pressure the other is charged and got ready to follow on. When another press is ready for charging, the air communication between the storage vessel and the rams is cut off, and the air in the ram under pressure is admitted through a bye-pass to the ram containing the fresh charge. The empty press

cost. As a result of these experiments a stout jute canvas is now employed. This material wears until the fibres become so matted together as to prevent the escape of the filtrate. Cocoa matting has also been tried, but the plates are unsuited for that material. Experiments have also been made with different kinds of lime for pressing. Grey-stone lime was found to be the best for the purpose, and is now used in lump form, the pneumatic lime mixers rendering the use of ground lime, with its extra cost for grinding, unnecessary.

The resident population of the district draining to these Works is 50,000 (in the summer months this is much increased), and the average quantity of sewage is from 40 to 45 gallons per head per diem, or a total of from 14 to 16 million gallons per week, exclusive of storm water. From this the wet sludge obtained is approximately 625 tons, which is reduced to from 110 to 120 tons of pressed cake, according to the time of year. To accomplish this, the pressing plant is in operation five days of ten hours each per week. The approximate cost at

is then opened and filled with sludge, forced up by the pressure of the waste air from the first ram. Thus a considerable saving of compressed air is effected, as the whole of the air must be allowed to escape before the ram can be again charged with sludge. The filtrate from the presses is collected in troughs and conveyed back to the untreated sewage chamber, and the pressed cake from the presses is dropped into tip wagons, on rails underneath. Each wagon is made to contain one ton of cake. The air-pressing system is usually employed, the force pump being retained as a stand-by or reserve. Before the air-pressing system was adopted, the breaking of a plate was of frequent occurrence, and maintenance became a somewhat heavy item. Although the sludge was screened before being forced into the press the feed passages occasionally became choked, and if at the same time one of the pump suction valves was hung up, the whole of the power from the two steam cylinders would be transmitted to the one plunger, and an unsteady rise in pressure occurred, resulting in the breaking of the plate. Since the adoption of the air system no fracture has occurred. When the force pump is employed, one of the air forcing rams is usually employed as a cushion vessel. Experiments have been made with different qualities of filtering cloth, it was found that the cheaper and thinner sorts answered as well as the better class, so far as filtering was concerned, but were worn out much quicker. Tanned canvas and copperised canvas was also tried. These lasted slightly longer than untreated cloth of the same quality, but not sufficiently long to compensate for the extra

Trials of the air pressing and the direct forcing system have recently been made, and the results are given in the following table:—

	By Air Compressor. Six presses. 26/1/97.	By Force Pump Three presses. 29/1/97.
1. Cubic feet of wet sludge	T. C. Q. LB. 133 7 2 11	T. C. Q. LB. 76 9 1 1
2. Pressed cake ...	29 3 3 4	15 5 3 6
3. Water ex- pressed ...	104 3 3 7	61 3 1 23
4. Total revolutions No.	44,574	27,484
5. Average revolu- tions per min.	72.47	43.97
6. Average mean pressure ...	26.512	17.292
7. Average pressure in presses lbs. per sq. in. ...	76.3	57.66
8. Indicated horse power of steam cylinders ...	11.70	2.60
9. Time in hours ... (Labour same in both cases).	10	10

It will be observed that the trial of the air pressing system was made with six presses in operation, and the direct forcing system with three presses, so that for a comparison of the two results the figures of the direct forcing system must be doubled.

present per ton of pressed cake is as follows:—	
Labour	10d.
Lime	9d.
Cloths	4d.
Coal, oil, &c.	3d.
	2s. 2d.

THE London and North-Western Railway Company has under consideration the question of improving its main line between Tebay and Shap Station. At present the railway crosses Shap Fells through a rock cutting 60ft. deep. When that cutting was made half a century ago it was considered a great engineering feat. As many as 500 men were employed upon the cutting at one time; twenty-three tons of gunpowder were used in blasting the rock; and the work occupied two years. It would obviously be of great advantage if the additional "road" could be made upon easier gradients, instead of side by side with the existing permanent way. Surveyors have therefore been engaged during the past autumn in trying to find a better route than that which Stephenson founded, and they have staked one out, which is at present under consideration. It strikes off the present line a little north of Tebay, and, passing along the valley of the Birk Beck, passes close by Shap Wells, and then enters a tunnel about two miles in length, by means of which the worst part of the present ascent is got rid of. The line then rejoins the existing railway near the Shap Granite Works. An alternative route takes the line near to Kendal and joins the present railway near Lowther Park.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Nov. 13	Christchurch, Hants.—Workhouse Ward	Guardians	A. Druitt, Clerk, Workhouse, Christchurch.
" 13	Pontefract—Hospital	Joint Hospital Board	Tennant and Bagley, Architects, Pontefract.

THE ADVANCEMENT OF ARCHITECTURE.*

By PROF. G. AITCHISON, A.R.A.

(Continued from page 291.)

IN painting and in sculpture the student with a passion for either does not come fully armed, like Athené from Zeus' brain; anatomy has to be laboriously acquired, as well as the power of drawing or modelling the perfect human form; the art of composition has to be learned, as well as what sculpture and painting can properly represent. Architects are not born with a knowledge of statics, nor of the strength of materials, nor of the art of planning, nor of how to express the emotions that each particular structure should evoke; though we now see ornaments from the palaces of the Caesars, or from the boudoirs of Renaissance beauties, lavished on tailors' or oyster shops and on banks and insurance offices. I have seen the

GHASTLY ORNAMENTS OF ROMAN TEMPLES,

bullocks' skulls, on a bank, but I looked on these as a symbol of the architect. The Institute is a university—i.e., it does not teach but it examines, and informs students what they should know and where some of this information can be got. Amongst some the idea of teaching is almost a mania, and I admit that some things must be taught: the pronunciation of foreign tongues, the use of a foil or an oar; but, as far as I know, the Art of teaching is mainly non-existent. My experience of school teaching is this: I was put under a man who had mastered the subject I had to learn, and who was armed with a stick. He told me to learn a piece out of a book, and he allowed me what he thought was enough time to learn it in. If I did not know it, I was soundly beaten, and without doubt, this is a great stimulus to exertion. Lucian, of the Dialogues, was supposed to have a taste for sculpture, but his master thought he had not striven enough, and as he had broken a piece of marble, too, gave him so severe a beating that he abandoned the Art. Unfortunately

NO REAL TEXT-BOOK HAS BEEN WRITTEN ON ARCHITECTURE,

though all but how to produce the emotions proper to any structure may be picked up from various books. Those architects who can produce the proper emotions have something else to do than to explain the means they employ, even if they could explain them. And the knowledge, too, of the means used to produce emotions will not give the power to produce them, or else all the real critics of æsthetics would be poets, painters, sculptors, architects, or musical composers as well. You cannot suppose that those artists who have excited emotions have not tried to learn all they could from their predecessors. In the case of the poets at least we know that they have studied the works of their predecessors, and translated them when in foreign tongues, and paraphrased them when in their own; and though Horace's maxim is excellent, that "if you want to make your hearers cry, you must cry yourself," yet even when he did cry, he had to learn the precise mechanism for causing his hearers to weep. Architects must study and paraphrase those buildings and those members of buildings that have produced the proper emotions in them. An architect must also recollect that those who are to be moved by his building are not Greeks, Romans, mediævals, nor Italians of bygone ages, but the people of his own time. Still, if you can touch the master chords of humanity, they are not so very differently attuned now from what they were in the earliest times, or else we should not laugh at the wit of Aristophanes, of Rabelais, of Swift, or of Molière; nor cry over the pathos of Homer, Æschylus, Sophocles, Dante, or Shakespeare. We can at least see that an architectural student has the knowledge that he cannot

properly do without, and we shall find this alone will have a very good effect on the Profession; but it is almost impossible to divest men's minds of cant. The student is asked to know all sorts of things, some of which are interesting, some pleasant, and some dull, that have no bearing on Architecture. It is interesting enough to know that hazel nuts were shipped at Barcelona and currents at Patras, but we use

NEITHER DRY NUTS NOR CURRENTS IN ARCHITECTURE;

it is pleasant enough to understand Greek, Latin, Hebrew, and Sanscrit; French, Italian, German, Spanish, Portuguese, Russian, and Arabic; but they are no more architectural Arts than the broad-sword exercise or being able to shoot flying. It is interesting enough to know who built the Parthenon, or the Pantheon, or King's Cross, but it is no more Architecture than playing on the fiddle or dancing the polka. We believe that Nature perfectly adapts all her living works to the actions they have to perform without waste of material; and while some are exquisitely beautiful, some majestic, and some comic, others are commonplace, and some are repulsive, hideous, or frightful; but they all have character. It is only by studying Nature's works and former buildings, and deducing laws from them, that we can hope to cultivate that sense which makes us like one form and detest another, so I think that such a study is necessary for those who wish to become architects; for though

A KNOWLEDGE OF STATICS

will make our buildings safe, and prevent a want of due ratio between the parts, we must trust to a cultivated eye till the laws are discovered to make them beautiful, majestic, or sublime. We should, I think, make our students first design in old-world materials—wood, brick, stone, and marble—so that their designs can be compared with the existing successful monuments; but we have new materials which have to be brought within the pale of Architecture. In my opinion, we cannot do better than make students design in cast-iron when they have succeeded in designing in the old world materials. It is too expensive a material to disregard its statical conditions. It is difficult to arrange a column or a stanchion so that its capital may securely carry a heavy superstructure with a large base. It is difficult to make the base of this column or stanchion wide enough to transmit safely the weight it bears on to a foundation of much softer material; there are difficulties in the design of mouldings and floral ornament that can be cast; and there are absolutely no examples to imitate, so that the knowledge, care, skill, and invention of the student are called into play. We cannot believe that

THE INGENIOUS MEDIEVAL ARCHITECTS

would have foregone the use of such valuable and powerful materials as wrought-iron, cast-iron and steel, on account of Mr. Ruskin's objection that they were not mentioned as building materials in the Bible. It may be truly said that nothing can be effected in a structural art like Architecture by talking; but when a man is lost in a wood, and you can direct him to the road out of it, you have done him most effectual service. Architecture has been in a wood since the fifteenth century, and it can never progress until it gets out of this wood. The intelligent architectural student wants to know the mark he is to aim at, and how he may hit it; and I am afraid the general opinion would be that he is to learn to sketch in perspective, and when he asks what he should sketch, he would be told everything that appears to him interesting, striking, or beautiful, because when he gets into practice he will find that the public may ask him to build in any style the world has known. A good instance of the ignorant instructing the wise! He should be told that he has first to learn how to construct, and that the aim of Architecture is to make of each building an organism like Nature's, fitted to fulfil its duties as perfectly

as possible without waste of material, and to make it properly tell the tale of its purpose or purposes, and that if sculpture and painting can be afforded, he is to use them to tell its tale more completely. When the Associate's curriculum is amended I would reduce the examinations to two, a matriculation examination and a final one, for two reasons: first, because time would be saved; and, secondly, so that each student might keep up the knowledge and skill he had acquired. Professor De Morgan used to say that when an examination was passed, the students thought all the knowledge required for passing it might be forgotten, and looked on his asking again for subjects they had once passed as a fraud, as if they were asked to pay a second time when they had the receipt for the first payment. The final examination should include a certificate that the candidate has acted as clerk of the works on some building for at least six months, to familiarise him with real work, and to impress on his mind that it is building and not drawing that is wanted. These amendments would greatly improve the condition of Architecture; but Architecture would be more improved if there were an examination for Fellows as well. The complaint is that there is

A DEARTH OF FELLOWS,

and a proposition is made like that adopted by the Giver of the Scripture feast, that we should send into the highways and byways and compel them to come in. There would surely be no need of compulsion if it were felt to be an advantage and an honour to be a Fellow. It has been said that eventually every Fellow must have been an Associate, but the present conditions of the Fellowship offer a way to escape examination. No one, I imagine, objects to see really distinguished architects being admitted by acclamation; but at present there are only three real qualifications for the Fellowship—that the candidate is thirty years of age, is honest, and has been seven years in practice; though it is true that the Council look at the drawings turned out of his office. Someone said of a Prime Minister in Cobbett's day that he was honest; to which Cobbett replied that no one would take a footman if honesty were his only qualification, and put this question: "Shall that be the only qualification for a Prime Minister?" No one can say that physicians or surgeons do not desire and do not strive to be Fellows of their respective colleges, or that both are not better for having learned the necessary elements of their profession. The only objection to

A PROPER EXAMINATION OF FELLOWS

is that it is absurd to expect it from men of thirty years of age who have been seven years in practice. The physicians and surgeons saw the force of this, and though the examination may take place at twenty-one years of age, the title cannot be assumed until they are twenty-five. The Fellow's examination should only be more complete than that of the Associates; and the candidate should have a certificate of having acted as a clerk of the works for a year, and made out the necessary full-sized diagrams for the work on the floor. I have only one remark to make before I give my peroration. I am rather surprised that architects do not see that degrees of excellence are possible in Architecture; or, if they do see it, that they do not act on their convictions. The greatest living architects are contented with the same remuneration for their work as the apprentice just out of his time, and merely seek to get into a wholesale business. This greatly helps to degrade the Profession in the eyes of the public, and gives a very wrong impression of the facts, as every architect well knows. Thousands of public monuments have been erected in Europe since the Golden Age of Greece, not to speak of important private buildings; yet the Parthenon and the Caryatid Temple on the Erechtheion have never been equalled since, nor the interior of the Pantheon, nor the west front of Notre Dame at Paris, nor the Cornaro-Spinelli Palace, nor the Scuola di San Marco, nor the town hall of Brescia. In all the other Fine Arts the first successful effort brings its author next to nothing, but those produced in the height of his skill and

* The President of the Royal Institute of British Architects' opening address of the session 1897-98, delivered at the first General Meeting, held on Monday, November 1st.

knowledge mostly bring him wealth, if that be his desire.

THE GREAT DIOGENES WAS A BEGGAR, and Jean François Millet, the one artist in Europe according to the Japanese, was in poverty; and so was Alfred Stevens. Every architect knows that in the case of architectural works of moderate size it is a question if he is to gain or lose a five-pound note; and the more care he takes, the more certainly is the balance on the wrong side. The fashionable architect with a hundred buildings has a difficulty in persuading the Profession or the public that he bestows the same loving care on each of his hundred buildings that he would do if he had only two, and is apt to provoke the retort of the lioness to the beasts in *Æsop's Fables*. "There was a great stir made among all the beasts, which could boast of the largest family. So they came to the lioness: 'And how many,' said they, 'do you have at a birth?' 'One,' said she grimly; 'but that one is a lion.'" I cannot help desiring to see the pursuit of Architecture followed on sound principles, nor can I forget the absence of any system in my youth; for then, after you had drawn out examples of the Greek and Roman orders, genius was supposed to do the rest. I am delighted at the admiration of

OUR SMALLER DOMESTIC ARCHITECTURE

by our great morning newspaper, the *Times*, and by M. Paul Sédille in his "*L'Architecture Moderne en Angleterre*;" but I wish to see that admiration extended to our great public buildings as well. One sees to what lengths a proper architectural education may lead from mere savagery in the architectural triumph of the Middle Ages. If the true architectural high road could be again found all might hasten to the goal, and not be like the dragon's teeth when the stones were thrown into the middle of them. Who knows that in the case of the right road being found the public might not again take a passionate interest in the excellence of our Art, as it must have done at the great epochs? Modesty is a charming virtue in all, and especially in those of great intellectual endowments, but if this modesty is only to make us idle and worthless, let us throw it off. Let us no longer say we are so inferior to the ancient Greek, Roman, Byzantine, Saracen, Mediæval, and

RENAISSANCE ARCHITECTS

that it is no use trying to equal them. Have we relinquished the courage, daring, and self-reliance that once distinguished our race? If we have we must be contented to lag behind the rest of the world. If we are not equal to former races, and particularly to the Romans we so much resemble, I believe it is because we have got into a wrong road, and I would rather see architects take up the position of our Ambassador at the Court of the father of Frederick the Great than be ready to confess that the English are hopelessly inferior to the great architectural races. Frederick William, as you know, had a regiment of giants, and paraded them in front of our Ambassador, and asked him if he thought an equal number of Englishmen could beat them? The Ambassador said he could not say that, but he would undertake that half the number would try. I hope we are not worse than the men of Milton's days, and hear what he says of them: "Lords and Commons of England! Consider what nation it is whereof ye are, and whereof ye are the governors: a nation not slow and dull, but of a quick, ingenious, and piercing spirit; acute to invent, subtle and sinewy to discourse, not beneath the reach of any point the highest that human capacity can soar to. Therefore, the studies of learning in her deepest sciences have been so ancient and so eminent among us, that writers of good antiquity and able judgment have been persuaded that even the school of Pythagoras and the Persian wisdom took beginning from the old philosophy of this island. And that wise and civil Roman, Julius Agricola, who governed once here for Cæsar, preferred the natural wits of Britain before the laboured studies of the French." I firmly believe that the race has not degraded, and that if we will only again take up the right way of learning

we shall astonish ourselves and the world. May I not say:

"Men, my brothers, men the workers, ever reaping something new;
That which they have done but earnest of the things
that they shall do?"

To those who are not architects I may say that if you will devote yourselves solely to money-making and feasting, Architecture which mirrors the condition of nations at the time it is executed will certainly languish; for the admiration it should excite and the gratitude it should call forth is the very breath of its nostrils. It cannot, however, be said of the nation now that it is without aspirations, for there never was a time when so many were striving to penetrate the secrets of Nature, and the past acts and thoughts of man, and trying to yoke the power of Nature for man's use, and to teach and elevate their fellow-man and his help-meet. To women more liberty has been granted than Mary Wollstonecraft asked for, and they have achieved even more than she hoped for. But all these studies and pursuits rather throw our contemporaries off those primary delights that Nature gave to raise, to solace, and to purify mankind—I mean

THE BEAUTIES OF FORM AND COLOUR

and the impressiveness of light and shade. But if these lessons be neglected, we shall leave behind us but a poor account of ourselves in those Arts which strike the eye and impress the imagination. We have, too, unfortunately abandoned the symbolic, the emblematic, and the allegorical, so that we can tell no story to the eye by which the multitude may be impressed. It is foolishly believed that a paragraph in a newspaper or in an Act of Parliament will tell the same story and make the same impression on the multitude that can be made by a fine building adorned with storied and allegorical sculpture, and painting such as we see in the Arch of Titus or Severus. The Jubilee procession, poor as it was as compared with Mantegna's "*Triumph of Julius Cæsar*," told more of our power and extent of empire than all the history that has been written in this century. Recollect what an obtrusive art Architecture is, and how strongly it forces itself on the attention; how long it lasts, and how it forces people to come to see it in its own country. If you would only think that it is the history of the present power and cultivation of the people you would at least learn enough about Architecture to be able to judge of its excellence as you do about the other fine Arts you love, and be as proud of its excellence and as delighted with it, as you are with the pictures, statues, poetry, romances, and musical compositions of the day, and when you do take the same interest in it you will certainly have your reward.—Mr. Heathcote Statham, in proposing a vote of thanks to the President, was sure he would carry the House with him in saying that it was very seldom they had listened to an address from the Presidential chair which comprised so much weighty and important thought on the Art and profession of Architecture within so short limits. The address could be divided into two main objects, for the President had touched upon what the Institute could do and what, in a broader sense, could be expected and done by modern Architecture. The speaker considered the Institute examinations, the objects of which had been very forcibly laid down by the President, as having a preventive value. They did not want people in the Profession who did not really care for Architecture, and mean to do their best for the Art; the Institute was a sentinel to drive such away. And referring to what had been said, as the advice given to the student of Architecture to sketch in perspective everything that was beautiful, Mr. Statham thought that the practice as at present carried on was not without its danger, for it fostered a love of the details of ancient buildings, which in turn, led to a desire to reproduce those details elsewhere. He suggested that the measuring and drawing out of construction of old buildings was

A FAR MORE IMPORTANT TRAINING

to young architects than sketching their exterior appearance. Respecting the architectural education question, the President had

rather cast a slur upon the literary part of the examinations when he said it was very well to know a number of languages, but they did not constitute Architecture. No, they did not; but it was just as well an architect should not write to one that his building was designed "in the style of fourteenth century." He had received that twice from architects in large practice. Speaking as to what Architecture is, and how to improve it, the speaker did not quite agree with the President in all he had said as to statics. Was not the plan of a building, he asked, the central artistic idea? We had a fine example of that in what he had always considered to be our greatest modern building—the Houses of Parliament. It was an easy matter to say that the detail of the Houses of Parliament was only a repetition of Tudor detail. So it was; that was what was thought right at the time. But did not the real excellence of the building consist in that grand conception of the plan, and the grouping of the two towers and the central spire? The central idea was the plan, and that was really a form of Art just as much as the detail of the building. Then the President had always had a very strong opinion as to the importance of giving our minds to the treatment of new materials, especially iron. It seemed a very neat way of putting it to say that the Egyptians had a granite Architecture, the Greeks a marble Architecture, the mediæval architects a stone Architecture, and

WE HAD GOT IRON;

but, after all, did not all those ancient materials—granite, marble, stone—belong to the same family? They were all natural materials. They could not quite put iron on the same footing with them. It was, to some extent, an artificial material, artificially prepared; moreover, it had to be painted in order to preserve it from the weather. Then, again, was iron he asked, a monumental material? We did not know that yet. They could not be content with a monumental material that was only to last five centuries, the time given to one of the greatest iron structures in the country by its engineer; therefore he thought that the parallel between iron as a new material and the old stone materials was an argument which would not hold water, at any rate, it was open to serious question. The speaker also deprecated the comparison between great modern works, such as the Forth Bridge and the Cathedrals of the fourteenth century. These engineering works were certainly striking and grand in their way, but they were not built with the object of being beautiful, but rather to fulfil purely utilitarian purposes; the Cathedrals were

BUILT WITH THE OBJECT OF BEAUTY,

and there the essential difference laid. They must not forget that Architecture, although based on construction, had for its real object the production of beauty which would appeal to the imagination. Proceeding to deal with the possibility of producing anything great in the present day, he said he had no sympathy with men like the late William Morris—he did not speak in disrespect to his memory—who was frequently saying "Architecture is dead! Architecture is dead!" Why not try to make it live? If they looked upon Architecture as a symbolism of what they desired the building to express, instead of going to the past for symbols, they would be able to do something; perhaps it would not be so elaborate as the Renaissance or Classic or Gothic, but something which would fulfil the exhortation of the poet:—

"Oh, thou sculptor, painter, poet!
Take this lesson to thy heart—
That is best which lieth nearest;
Shape from that thy work of art."

—Dr. Alexander Murray seconded the vote of thanks, and said no one was better entitled to be heard on the subject of the education of architects than the President, from whose address he gave quotations, and asked how much was meant by the words "waste of material." The danger of wasting material, he said, was perhaps more imminent to architects than to any other profession, because of the great variety of taste or want of taste they had to consult. Referring to the

President's remarks of the obtrusiveness of Architecture, the speaker said it had always been true, and never more so than now, that great Art forced people to come and see it in its own country. A long expensive journey was considered small cost if the sight of the Parthenon was the reward. This tendency to admire the charms of other and older countries brought with it the aspiration to erect in our own works that which would keep alive the memory of the men of our own day. Proceeding, he did not suppose the President, who they all knew was greatly fascinated by Greek mouldings seen in the sunshine of Greece, would banish mouldings from the English shores because they lost so much from our atmosphere. Such a thing would be much regretted, because ineffective as Greek mouldings would be in our climate, they still displayed much of their unique beauty. Although we in this country could not have the startling effects seen in Greece, we might live in hope that some architect, inspired by what he had seen there, might find an equivalent.

RE-OPENING OF THE TIVOLI RESTAURANT.

THE Tivoli Restaurant, which has been closed for a lengthened period, was last week re-opened in signal splendour. Extensive alterations have been made, and the premises have been re-decorated throughout by Messrs. Waring and Sons, of Oxford Street, under the supervision of Mr. E. Runtz. An entire new suite of rooms, with lavatories, &c., have been added at the top of the building, which are intended for masonic meetings. These rooms possess the advantage of being isolated from the other parts of the building. A carved and panelled oak dado runs round the principal room. Upon this floor the filling is a dark blue paper, and the ceiling is panelled and painted with heraldic designs, and a very bold projecting carved overmantel is painted with masonic emblems. The staircase walls are decorated on the flat, with painted representations of Roman columns, &c.

THE FLEMISH BANQUETING HALL

upon the second floor is a very fine example of Flemish Renaissance style. The floor is of polished oak, both the walls and ceiling are panelled in oak and richly carved, as is also the bold projecting overmantel and the screen which partitions off the apartment about a third of its length from the fireplace end, and which is a good specimen of the same style, being formed of square pilasters, surmounted with columns, all of oak and richly carved. Tapestry adorns the walls, which are also relieved by dark red panels in the upper portion of the oak framing. Electric lamps of mediæval patterns, hanging from artistic wrought-iron scrolls, project at regular intervals round the walls, and several artistic wrought-iron electroliers hang from the ceiling. The oak furniture is in keeping with the other appointments, and the dark-red Turkey carpet adds just sufficient colour to relieve the brown oak, the whole producing an effect in which quietness of tone is combined with richness of ornamentation.

THE PALM ROOM

upon the first floor is of the same size as the Flemish Hall above, and will accommodate 130 persons, but the style of decoration adopted is quite different. The effect produced is equally as rich and subdued, and the entire absence of the usual garish and tawdry looking-glass style of restaurant decoration is conspicuous by its absence. The plaster palm-leaf decorations of the ceiling and cornice give the room its designation, the whiteness being relieved by gilding which, however, has been used as sparingly as possible. The floor is marble, as is also the dado, the panels in the latter being formed of coloured marble, the flatness of which is relieved at intervals with projecting alabaster trusses boldly carved, which form consoles. The walls above this dado are panelled out with fluted pilasters painted white and relieved with gold, the

panels between being filled in with velvet of a dark-green pattern. The doors are of solid oak-stained green, and fitted with large copper-bronze handles specially designed by the architect, of a most handsome and chased design. The furniture is of oak-stained green, and upholstered in the same colour, and dark-green silk curtains hang on each side of the windows, and upon each of the alabaster consoles previously mentioned a massive plant pot of brass Benares ware, containing large ferns, give a character to the room more resembling that to be expected in a gentleman's mansion than in a public restaurant. The system of lighting this room adds to this effect, the electric lights which depend from the centre of the fern-leaf decorations of the ceiling being surrounded with fancy shades of gold-coloured silk, through which the light shines with a soft, yellow radiance. Adjoining this room is the music-room, the sounds passing through a grille, while by the substitution of iron gratings for the skirting in the hall above, and an arrangement of adjustable flaps, the sounds of the music can be shut off or admitted into that room at the same time. A well-appointed kitchen is on the same floor.

THE BAR AND BUFFET

is situated upon the ground floor, and has several unique features. Here, as elsewhere, gaudy colours and tawdry effects have been discarded, the ceiling being painted in rich, soft blues and reds. The walls are panelled in oak, richly carved, and a carved oak screen divides the bar from the grill-room, the interstices between the oak uprights being filled in with dark red glazed bricks. The counter is unique; the front, in the form of a bold coving composed of glazed red bricks, formed into recesses by bold carved oak trusses, the whole surmounted by a St. Anne's marble top. The electroliers are of copper.

THE NEW FOYER AND CRUSH ROOMS

are decorated in Indian style, the colours of the faience work being exceedingly rich, and the electroliers of peculiar shape being of an essentially Indian character. The circular head of the exterior doorway is arranged in square panels, from the centre of each of which an electric light bulb projects, producing a brilliant effect at night. The doors of the main entrance are stained and polished a deep red colour, which, however, only tends to show up the lights and shades of the grain, which are the chief beauties of this favourite wood. Messrs. Waring must feel great satisfaction at the results they have been able to produce, and which are a distinct improvement, from an æsthetic point of view, from the methods of decoration usually adopted for public restaurants. F. W. D.

The sketch of an old and interesting inn at Wellingboro', which formed one of the illustrations of Mr. Herbert Norman's article on "Northamptonshire," appearing in our pages a fortnight ago, represented "The Golden Lion," and not "The Sun," as stated.

A TABLE of the names of the Archbishops of Canterbury, with a date of the enthronement of each, has lately been placed on the walls of Canterbury Cathedral. The list begins with "Augustine, 597," and ends with "Temple, 1897." It fills two panels and overlaps into a third.

The Society of Encouragement of Art has decided to erect in Stuttgart a bronze memorial tablet to Rubinstein, who resided for a long time in that town, and directed musical festivals there. Besides the inscription, the tablet has a relief figure of Rubinstein, modelled by the sculptor Bausch.

SOME idea of the cost of the Parliament Street, London, improvement may be gathered from the fact that for the premises at the south-west corner of the street, the lower portion of which is occupied by the Aërated Bread Company, a special jury has just fixed thirty-seven and a half years' purchase as the amount to be paid to the freeholders. As the house is let on lease at £700 per annum, this means a round sum of £26,250 for one house alone.

Professional Items.

BIRMINGHAM.—The extension of Bourne College, Quinton, is now completed. Messrs. H. Dorse and Co., Cradley Heath, Staffordshire, have carried out the work at a cost of about £5000, under the supervision of Mr. A. Freeman Smith.

BELFAST.—Several new wards and an operating room, recently added to the Ulster Eye, Ear, and Throat Hospital, were opened a few days ago. The extension comprises new bath-rooms and water-closets, which are fitted up after the most approved modern system. The floors are tiled and the walls cemented. New day rooms are provided for the male and female patients, and eight new private wards are added. A special feature is the operating room, which is constructed at the top of the hospital, so as to secure good light, quietness, and absolute cleanliness. This room has a northern aspect, and is lighted by a large window at the side and a roof window of plate glass. The contract was carried out by the late Mr. Isaac Hewitt, builder, under the superintendence of Mr. Henry Scaver, architect, Royal Avenue.

BURY.—The Art Gallery Committee of the Bury Corporation has considered the designs for the erection of a suitable building in which to place the Wrigley collection of pictures. It was decided to recommend the adoption of No. 1 premiated design bearing the motto "Mezzotint," and to appoint Messrs. Woodhouse and Willoughby, Manchester, as architects.

ELLESMERE.—An imposing hall, which is a worthy addition to the existing block of college buildings, has been erected, and the group now form probably the finest schools in the county from an architectural standpoint. The new schoolroom has been built from the designs of the architects of the college, Messrs. Carpenter and Ingelow, on a scale proportionate to the rest of the college. It is a fine room 130ft. long and 36ft. wide, and the height inside is 45ft. to the apex of the roof. The hammer-beam roof is of firwood, with open tracery work, and at some future date there is to be 12ft. of fir panelling round the walls, and ten class-rooms, which are designed to abut on the sides of the central room, will be added. The room is lighted by high windows along both sides, and by a fine one of five lights at the south end. It is built of brick with stone dressings, and is paved with wood blocks. The total cost of the structure has been £5202.

EXETER.—General Sir Redvers Buller, V.C., recently laid the foundation-stone of the new Church of Emmanuel at St. Thomas, Exeter. The new church, which will accommodate 600 worshippers, will consist of a chancel, with organ chamber on the north side, side chapel and vestries for clergy and choir on the south, nave, with north and south aisles and transepts, and south-west tower. The style selected is an adaptation of the English Gothic of the beginning of the fifteenth century. The walls externally are to be built between the dressings, in Babbacombe stone, internally in Pocombe. The dressings, window tracery, &c., are to be in Bath stone. The roofs are open-timber ones, constructed in pitch-pine, and the floors throughout are to be laid with wood blocks. The windows, generally, are to be glazed with rough cathedral glass of a light shade. The heating is to be by hot water, and on account of the dampness of the site the chamber is arranged in an iron tank under the north transept. The ventilation is to be effected through inlets in the sides of the windows, and an exhaust ventilator in the turret over the nave roof. The extension of the transept northward, with additional entrance porch and other slight alterations, have taken place since the first designs were made.

HERNE BAY.—The trustees of the Friendly Societies' Convalescent Home have appointed Mr. A. Saxon Snell, F.R.I.B.A., architect for the erection of a home at Herne Bay for fifty patients. The entire cost of the building will be defrayed by Mr. J. Passmore Edwards, who laid the foundation stone on Saturday.

HEYSHAM.—Heysham harbour is just over a mile distant from Heysham village. The first breakwater commences with a cutting over the brow of the hill from the lane, and stretches out to sea a distance of a mile. This embankment will be 500ft. wide at the root, will taper off to 150ft., and will be made principally of stone and rock. The companion breakwater, commencing at Red Nab, will be a mile and a half long. The harbour proper will cover forty acres, and will be 17ft. deep at low water, whilst the pier running out into the centre of the harbour will be 2000ft. long. Upwards of 1½ million cubic yards of sand, etc., will have to be scooped out of the harbour, and two million cubic yards of the shore side removed, all of which will be used in the construction of the mammoth breakwaters. The contract for the harbour has been let at £480,000 to Messrs. Price and Wills, of Westminster, and the work will be carried out under the superintendence of their agent, Mr. Furness.

HUDDERSFIELD.—An exhibition of the work of students in the Art classes of the Technical College has just concluded at Huddersfield. More attention was given during last session than usual to original design, and to its practical application to industries. The result is that there is a greater number of designs shown than usual. These designs are for friezes, panels, caskets, silver plates, cotton prints, spandrels, damasks, wall decorations in stencil, wall paper, &c. Prominent amongst these is a model design for a Gesso ceiling by Mr. J. H. Milner, assistant Art master, with an enlarged sectional drawing. A floral design for a fire screen panel has been carried out with beautiful effect in appliqué embroidery. There is also a specimen of the application of design to brass, the design being eaten out with acid. A feature of last session's work was the comparatively large number of painters' and decorators' apprentices who took part in it, and their specimens display much taste.

LEEDS.—The Building Clauses Committee of the Leeds Corporation is engaged in revising the building regulations for the city. A draft, numbering 117 bye-laws, has been prepared, and copies sent to the Leeds Master Builders' Association and the Leeds and Yorkshire Architectural Society, in order that those bodies may review the list, and make what suggestions they think proper. Many of the old bye-laws have been retained, a considerable number have been materially modified, and there are some new regulations. With regard to the laying out of new streets, hitherto the minimum width has been 36ft. Now it is proposed that main thoroughfares shall not be less than 42ft. There is a proviso, however, that a street may be 36ft., on condition that at each side there is an area of 6ft., making 48ft. from house front to house front. A new bye-law stipulates that in the case of dwelling-houses to be erected in damp situations there shall be a layer of concrete 6in. thick, or a covering of asphalt. Another provision of a like character is to the effect that in every new building a damp course shall be inserted at a height of not less than 3in. above the surface of the ground. In order to restrict the use of old bricks in the erection of new dwellings it is provided that no such material shall form part of an external wall or of an internal half-brick wall, but that good old whole bricks shall be allowed in an internal 9in. wall on condition that "not more than two thirds of the same are mixed with one-third of new bricks." Special regulations are introduced with reference to the quality of other materials. For example, mortar must consist of good lime and sand in the proportion of one-third lime and two-thirds sand. There are likewise provisions as to the

strength of timbers supporting roofs, floor joists, beams and girders, both in the case of dwelling-houses and business premises. The necessity of providing ventilation, not only in dwellings, but also in places of entertainment and places of worship, has received attention, and further effort has been made to secure efficient sewerage and to provide for the ventilation of drains. The Architectural Society, whilst cordially approving of many of the provisions, have suggested the alteration of a number. Surprise is expressed by some who have perused the draft that no alterations are proposed with regard to the thickness of party walls in business premises. At present such walls have to be of the same thickness as the external walls, and it is suggested that they should not be more than two thirds as thick. This and other points, however, will no doubt be carefully considered.

We learn that Mr. Francis W. Bedford, of 12, East Parade, Leeds, and also of 8, Princes Street, Westminster, S.W., has taken into partnership Mr. Sidney D. Kitson, M.A., and that henceforth the business will be carried on at the above addresses, under the style of "Bedford and Kitson."

MORECAMBE.—The extensions of the Morecambe Pier has now been commenced. The work is being carried out by Messrs. Magnall and Littlewood, of Manchester, their designs being selected in competition. The Widnes Foundry Co. are the contractors for the Pier, and Messrs. Peters, of Rochdale, are the contractors for the Pavilion. The new Pier comprises a new approach, the widening of the Pier, the providing of additional shelters, and the erection of a large pavilion. The semi-circular forebay, leading up to the entrance, will be 97ft. by 176ft. wide, and the entrance gateway will be a very attractive feature as seen from the Promenade, being a very fine combination of turrets, towers, and a large, semi-circular archway. This archway embraces the ticket offices, turnstiles, and other minor ornamental gates leading on to the Pier. The new Pier Promenade leading to the Pavilion will be 40ft. wide between the entrance gates and the Pavilion platform, to meet the increasing demand for promenading space, and at regular intervals will be placed kiosks or shelters. Without interfering with the present pier head, a platform 250ft. long and 150ft. wide will be constructed to form the substructure for the Pavilion. The Pavilion will form an attractive feature from the shore, having a large dome and campanile towers. At the back of the Pavilion is an ornamental verandah and shelter for use in inclement weather.

NETHERTON DUDLEY.—The tender, £700, of Messrs. H. Dorse and Co., Cradley Heath, Staffordshire, has been accepted for the erection of offices for Messrs. S. Lewis and Co., at Netherton Dudley. Mr. A. Ramsell, of Dudley, is the architect.

OLD HILL, STAFFORDSHIRE.—For many years past the urgent need for more adequate and healthful accommodation for the Tabernacle Sunday Schools has been recognised by the trustees and officials. Mr. A. Ramsell, architect, Dudley, has prepared plans for a new building, and the tender of Messrs. H. Dorse and Co., Cradley Heath, has been accepted at the cost of £1850.

OLDBURY.—The Parish Church of Oldbury-upon-Severn has been destroyed by fire. The sacred edifice, situated on an eminence a short distance from the Severn, occupied the site of a Roman camp, and was a stone building of the Early English style, supposed to have been built in the eleventh century. There was originally a spire, which was blown down in 1702. In 1885 and 1886 the church was restored, and the south aisle and porch rebuilt. With the exception of the two porches the building is an entire wreck. The huge bell was entirely melted, and the freestone on the handsome arches is broken and cracked. The huge and very ancient font, which was of one solid stone, is also destroyed.

SOUTHPORT.—The fittings of St. Luke's Church, which must be classed among the most ornate in any parish church in England, are now practically complete so far as they in themselves go, though much painted decoration has still to be done. They embrace massive elbowed stalls returned on the collegiate plan, all fashioned in well-seasoned English oak, and on the north side a sculptured pulpit of the same material, resting upon a base of polished alabaster; a splendid high altar, 10ft. 6in. long; and a superb tryptich and reredos (like all the rest, in carved oak), over 27ft. high. The great tryptich at the Church of the Holy Virgin, in Primrose Hill, London, N.W., designed by Mr. John L. Pearson, R.A., has long been named among the largest and finest conception of the sort in England; but there can be no doubt that Mr. Huon R. Matear, of Liverpool, the architect for St. Luke's and its accessions, has equalled, if not eclipsed, his better-known brother in Art in the creation of this splendid altar-piece. All the fittings, like the fabric itself, are of freely treated fifteenth century Gothic style of Architecture. The altar front is chastely traced, and is aptly enriched by emblems of the Passion and by conventionalised passion flower ornamentation. A special feature immediately above the super altars (of which there are two) is the introduction of ornamental panels, which are movable from the eastern side, so that flowers, candlesticks, and other ornaments may be placed thereupon. The whole is canopied out, and above again is the tryptich proper. The doves or wings are gracefully traceried, and have angels sculptured in the round kneeling upon them, apparently in the act of blowing trumpets. Still higher is more groined and tabernacle work, the whole terminating with a cross. Large statuettes of saints carved in the round and in solid oak adorn the niches. The pulpit stands just outside the dwarfed chancel wall, and is sixteen-sided on plan. At seven of the angles are wide and projecting octagonal canopied niches for sculptured figures, whilst the flanks between are carved and traceried. The upper part is ornamented by a wide band of rich carving. At intervals are shields bearing religious monograms. In the stalls provision is made for the ample accommodation of the officiating clergy, forty singing men and twenty-four boys. They have traceried fronts, backs, and standards, and the linen panel ornamentation is introduced in some of the seat backs. The elbows of the seats are all carved. At the entrance to the chancel, on the pillars at the end of the return stalls, are sculptured statues of angels in adoration. The whole of these splendid additions to St. Luke's Church have been carried out and placed *in situ* by Messrs. Hems and Sons, of Exeter. The entire cost is calculated at between £1000 and £2000.

STOCKPORT.—Since March last an important work has been in progress at the Portwood Gas Works, Stockport, a staff of men from the establishment of Messrs. Ashmore, Benson, Pease and Co., Stockton-on-Tees, having been engaged in making alterations and improvements in the gas holders. The work has been more or less of an experiment, a new principle being applied to one of the existing gas-holders. The new system, which is the invention of a member of the firm whose name we have given above, enables the gas-holder to be projected high above the columns, thus greatly increasing the storage capacity. It was decided that only one gas-holder should be dealt with at first, and one of the largest was selected for the purpose, a holder with a diameter of 150ft., with a tank of 32ft. deep, and a capacity of about a million cubic feet. The columns supporting this holder are 62ft. high, and, of course, that was also the height of the original holder. But by the new system two additional lifts have been built on the top of the old holder, and these are entirely unsupported by columns, and when lifted to its utmost capacity it will be raised to a total height of 120ft., or nearly 60ft. above the height of the columns. These two lifts give an additional capacity of nearly a million cubic feet, and are worked by means of steel wire ropes of ¾ in. diameter.

To obviate any strain upon the columns, an intermediate girder has been run round, and the pillars also braced with ties. Among the minor details, we may say that in the older style of gas-holders there is an inner framing attached to the crown, but, in connection with the one we are describing, this has been detached and fixed permanently to the bottom of the tank. Another new, and we may say excellent feature, is seen on the corner of the new erection. Round the edge a plate projects upwards to the extent of 4in., and thus is designed to protect the workman who may, for various reasons, be working on the top.

WOODVILLE.—The Church of St. Stephen, Woodville, has not been structurally or materially altered since its consecration fifty years ago until a few months ago, when, owing to serious defects in the building and foundations, it was found necessary to adopt a scheme for effecting practically its complete restoration, in order to prevent the threatened collapse of the chancel arch and the falling outward of the walls. The work was commenced in March by Messrs. T. Lowe and Sons, Burton-on-Trent, the preparation of the plans being entrusted to Messrs. Draper and Walters, of Leicester. The alterations embody the rebuilding of the north and south aisles, along the greater portion of the nave, and the lengthening of the chancel to the extent of 10ft. The chancel arch has been considerably widened and improved in other details, an organ chamber provided, an additional vestry introduced, and an east door put in. The building is in the "Modern Norman" style, and of a substantial nature. The aisles are separated from the nave by a stone arcade in three pieces, or circular columns with carved caps and arches, and the paving here, as well as in the chancel, is done with yellow pine wood blocks, the sacarium being treated with vitreous mosaic. A variety of stone has been used in the work, comprising Derbyshire and Hollington, and Coxbench, that of the outer walls being in sympathy with the original parts existing. The total amount of the contract is entered at £1,306.

THE WINTER SESSION.

THE INSTITUTION OF CIVIL ENGINEERS.

AT the first ordinary meeting of the 79th session, held on Tuesday, November 2nd, the President, Sir John Wolfe Barry, K.C.B., delivered a short address to the members, dealing with various matters concerning the present and future welfare of the Institution. He referred to the increasing duties devolving upon the Council in proportion to the growth and importance of the Institution, now numbering on its roll 7075 persons. He proceeded to refer to the Engineering Conference, held by the Institution in May, the estimated attendance at which was 850. Reviewing the subject of the examinations recently instituted, the President pointed out how they were intended to show that candidates for election into the class of Associate Members were acquainted with those general principles which had always been and must be recognised as the basis of the engineering profession, and also to make clear that each candidate possessed a somewhat fuller scientific knowledge of the elements of the particular branch in which his special training had laid. Although an advocate of examinations for the purpose of ensuring the possession among those who entered the Institution of proper qualification in respect of theoretical knowledge, the President desired to avoid being understood to claim for such knowledge one whit more than its real worth in the equipment of an Engineer. Practical knowledge was no less necessary now than formerly, and in the Engineer's office, in the workshop and on the works of construction, and there only, could a young engineer learn by experience to modify and correct theoretical conclusions by practical considerations.

ARCHITECTURAL ASSOCIATION LYRIC CLUB.

This season's opening concert of the Architectural Association Lyric Club (President, Mr. John Murray) was held a short time ago, at the Swallow Assembly Rooms, Piccadilly, when the President of the Architectural Association, Mr. Hampden W. Pratt, took the chair. There was an exceptionally large attendance of over 200 members and friends, among whom were several prominent members of the Architectural Association. During the evening a presidential hammer was handed by Mr. Hampden W. Pratt, on behalf of the club, to Mr. John Murray, and several nominations were read. An excellent programme was carried out, and the pleasant evening bids fair to inaugurate the most successful season that the club has yet attained. Among the artistes were: Miss Jessie Hotine, Messrs. Theo. Disdin, Roland Henry, S. Constanduros, Gurney Russell, J. Berridge Fraser, Stanley Graham, W. Coward, F. H. Willis, and Mark Ambient. Mr. C. D. Imhof, who has been accompanist for the club since its foundation, again presided at the piano.

DESIGN IN CONSTRUCTION.

The usual monthly meeting of the Glasgow Architectural Association was held in the Rooms, 187, Pitt Street, on Tuesday, 2nd inst., when Mr. James Salmon, delivered a paper entitled "Design in Construction." The lecturer divided his paper into two parts, the æsthetical and the practical; in the former, he satirised, in a racy fashion, the common practice of present-day architectural design, where features of old work were selected and strung together, either inflated or shrunk down as the case required. The same principle was acted upon in construction, the stock forms of the text books being reproduced without any consideration of their applicability, or attempt at fulfilling the same requirements by independent thought. This state of things Mr. Salmon blamed on the recognised system of stuffing students with dull rule-of-thumb details, instead of endeavouring to direct their minds to grasp the general principles and think independently. This was demonstrated by showing, in drawings and on the blackboard, modes other than those generally in use for carrying out a few of the commonest pieces of construction.

THE ARCHITECTURAL ASSOCIATION.

The President announced, at a meeting of the Architectural Association on Friday night, that the annual soiree will take place at the Matinee Theatre, on Friday, the 26th inst. After the reception, a musical play, specially written by Mr. F. D. Clapham, and entitled, "The Broken Contract, or An Egyptian Enigma," will be produced. The following were received into the membership of the Association:—Messrs. F. G. May, E. O. Payne, W. S. Payne, J. H. Pearson, C. E. Pease, C. M. Quilter, E. R. Taylor, E. P. Archer, A. C. Stair, C. C. Duggan, R. C. Fry, J. Haslam, C. F. Innocent, and E. H. Kent.

"EVOLUTION OF THE HOUSE."

The thirteenth meeting of the session was held on Wednesday, the 3rd inst., Mr. J. A. Williamson, president, in the chair. Mr. A. N. Paterson, M.A., Glasgow, delivered a lecture entitled "Evolution of the House," which was largely illustrated by diagrams. Mr. Paterson first treated of the earliest developments of domestic dwellings, and then described, in historical order, the houses of the Greeks and Romans, the Saxon hall and Norman castle, the grange and the monastery, the early town house, and the mansions of Elizabethan and Jacobean times. He traced the special Scottish developments from the fifteenth to seventeenth centuries, and gave a short description of the Palladian type of house and the house of the times of Queen Anne and the Georges.

ST. MICHAEL'S CHURCH, in Gresham Street, has been turned into a bank.

Correspondence.

TO CORRESPONDENTS.—Some weeks ago we were asked by several correspondents for additional information respecting a short work entitled "The Art of Tracing," by E. W. Fritchley, of Bombay, a review of which had appeared in our columns. At the time we were unable to answer the enquiries; we are now able to state, however, that a further supply of the book has been forwarded to England, and is obtainable from Messrs. William Watson and Co., 7, Waterloo Place, Pall Mall, at the price of 1s. 6d.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

BUILDERS' BOOK-KEEPING.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you recommend or know of a treatise or work dealing with "Builders' book-keeping," a thoroughly concise, brief and practical system of prime cost, contract, and jobbing accounts.—Yours faithfully, H. J. F.

So far as we can ascertain, there is no good work on builders' book-keeping, though we understand that a series of articles on the subject appeared not long since in one of our contemporaries. We are inclined to recommend a study of Hunter's Book-keeping, in which the principles of ordinary commercial book-keeping are very clearly explained in such a way that it would be quite possible to adopt them to any special requirements.

LEVELLING.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—What is the simplest plan for putting up a permanent and trustworthy bench mark on boggy soil where there is no building that can be guaranteed as stable within a mile or more?—Yours faithfully, UNSETTLED.

We are afraid that it will be very difficult to suggest a means for setting up a really satisfactory bench mark in the situation described. The somewhat expensive plan of driving a pile right down to the solid seems the only satisfactory solution, and this may not be practicable. It appears to be a case for the exercise of personal ingenuity, exercised by someone having a perfect knowledge of local circumstances.

QUANTITIES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you be so good as to inform me, through the medium of your Enquiry Department, the title, publisher, and price of a really good manual on the taking off of quantities? What I want is a book showing full details of where to measure to and from, what to include and exclude, to add or allow, and deduct. I have "Beaton's Quantities and Measurements," but this work does not show the trade details I desire as enumerated above.—Yours truly,

ENQUIRER.

Oct. 23rd, 1897.

There are two excellent works upon quantity surveying: one by Mr. J. Seaning, published by Spon, and the other by Professor B. Fletcher, published by Batsford, the price of either being about 9s. Mr. C. H. Searle, of 16, Southwark Street, S.E., is also bringing out a more exhaustive work in parts; and an

early issue of "Specification," the new publication from these offices, will contain a series of notes on quantity-taking in all trades.

RIDGE TILES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should feel obliged if you or some of your correspondents could inform me whether or not there is such a thing as an "unstrippable" ridge tile in the market. I mean a ridge tile that cannot be blown off by the wind. If there is I should be glad of particulars.—Yours truly, EXEBRIDGE.

November 1st, 1897.

Any ridge tile made to fit the pitch of the roof, and properly bedded in cement, is practically "unstrippable" by the wind. Failures are due to inferior workmanship. Careless builders often use stock tiles that are of flatter pitch than the roof, with the result that the wind gets under the open edges and upsets the tile; the remedy is obvious.

THE PROPORTION OF CHURCHES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can any readers of THE BUILDERS' JOURNAL inform me the rule, if any, how churches are proportioned? For example, what proportion does width bear to length, width or length to height, also what proportion when aisles are used? Perhaps there are some works on same, if so will you please let me know where I may get a copy.—Yours, etc.,

Castlerock,

Co. Londonderry, Ireland.

October 29th, 1897.

We are not aware that there are any absolute and fixed proportions for churches, any more than for other buildings. Architecture is not a matter of formula. You will find in "Lectures on Architecture," by Viollet-le-Duc, particularly in Lecture IX., all there is to be said on the subject. Notice that the title of the lecture is "On principles and branches of knowledge with which architects should be acquainted." With regard more particularly to churches, you will see the geometrical methods which he suggests the architects of the middle age employed in their cathedrals. It is, of course, open to you to consider these proportions—which doubtless exist—as coincidences; or, on the other hand, considering what a passion for geometry possessed these architects, you may think that they would consider it an added perfection if the main proportions of their buildings exactly fitted some geometric figure, such as the superior-posed triangles which give the light of the nave at Amiens. But if this is so, there is no obligation on us to follow this method; it is only a method, good or bad, not a principle. Such methods should certainly be known, but they must always be used with discretion and judgment; no amount of such knowledge can ever compensate for lack of taste and artistic insight.

We are informed that Messrs. J. B. Guthrie and Son, of 96 and 98, Leadenhall Street, have been appointed the London agents of Messrs. Smith and Co., of Station Street, Nottingham.

The election of the President of the Royal Society of Painters in Water Colours takes place on the 30th inst. There appears at present to be no consensus of opinion as to a candidate amongst the full members who constitute the electorate.

Notice to London and Provincial Readers.

The Editor of the "Builders' Journal" will at all times be pleased to receive and consider articles of a professional or technical character suitable for these pages. Papers read before Architectural bodies will also, if forwarded, receive careful consideration.

Trade and Craft.

ELECTRIC LIGHTING.

Mr. T. W. E. Higgins, surveyor to the Chelsea Vestry, has prepared an elaborate report, giving a digest of information obtained from various districts as to electric light installations. The report may almost be treated as a practical treatise on the working, financially and otherwise, of electric lighting. Mr. Higgins points out that the first object of any system is to lead the current from the diagonal terminals to the consumers lamps with the greatest efficiency and the smallest capital expenditure. In a high-pressure system it is always necessary to fix a transformer, either in the consumer's house or in a sub-station, to reduce the voltage from high to low pressure. An objection to the system is the dangerous nature of the currents employed. A high-pressure system is always most suitable when the electrical energy has to be carried for a long distance. With a low-pressure system the loss at high loads is great, but at low loads is small. The system is quite safe and most suitable when the district to be served is a small one. The most suitable low-pressure system would be the "Three-wire" system, by means of which a great saving in copper is effected, as compared to the simple parallel system, and efficient regulation of the pressure by means of feeders is possible in a district of the size of Kensal Town, without the use of transformers or motor generators. The very lowest cost of such an installation would be:—Site, £3500; buildings, £6000; boilers, machinery, and electrical apparatus, £10,000; mains and feeders laid complete, £12,000; provisional order, fees, instruments, and incidental expenses, £4500. The annual cost of working such a station, when it is in thorough working order, with a fair load, should not exceed 4.5 pence per unit sold, that is, of course making no allowance for repayment of capital.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BELFAST—For alterations and extensions to licensed premises, corner of Henry Street, and Nelson Street, for Mr. C. Cassidy. Mr. John V. Brennan, architect, 31, High Street, Belfast:—

M. Mooney and Sons ... £203 D. J. Green, 3, Spencer Street (accepted) ... 145

Wm. G. Callen ... 170

BEVERLY (Kent)—For additions and repairs to farm house, at Belvidere, Kent. Mr. St. Pierre Harris, architect and surveyor:—

G. H. Cuning ... £406

BURWICK-ON-TWEED—Accepted for Spittal Sewerage Works, for the Sanitary Authority. Mr. R. Dickenson, Borough surveyor, U.S.A. Buildings, Burwick:—

Macraay and Son, Broughty Ferry ... £1,245 1 1

BRIDLINGTON (Kent)—For the erection of a villa residence, for Mr. W. M. Hopper, of Hull. Mr. J. M. Dossor, architect, 2, Manor-street, Hull:—

John Kennard ... £1,177 18 9 F. Blackburn and Thos. Goates ... 973 0 0 Son, Hull and F. Hall ... 566 0 0 Bridlington ... £946 0 0

* Exclusive of mason. † Accepted.

BUCKFASTLEIGH (Devon)—For alterations and additions to farm buildings at Torr Dean, for Mr. John Fleming, J.P., Bigadon, Buckfastleigh. Mr. W. M. Tolitt, architect, Totnes:—

Jackson and Son ... £125 0 T. Luckraft ... £119 8

Arscott and Pether ... 122 0

[All of Buckfastleigh.]

CARDIFF—For alterations and additions to the "Spotlands" Inn, Cardiff, for Messrs. W. Hancock and Co., The Brewery, Cardiff:—

Evans Bros. and Co. ... £800 0 John Mathias ... £558 10

Williams and Thomas ... 625 0 Beames and Nephews, S. Shepton and Son ... 560 5 Cardiff ... 547 5

* Accepted.

CHELSEFIELD (Kent)—Accepted for the erection of a small detached house at Chelsfield, Kent, for Mr. Blackwell. Mr. St. Pierre Harris, architect, &c., 8, Ironmonger-lane, E.C., and Orpington:—

J. Smith ... £230

DAGENHAM (Essex)—For the erection of pavilion at small-pox hospital, for the West Ham Town Council. Mr. Lewis Angell, C.E., Town Hall, Stratford, E.:—

G. Sharpe ... £4,960 0 W. Gregr and Son, A. H. Carter ... 4,848 13 Stratford ... £4,693 0

* Accepted.

DEVONPORT—For alterations to business premises, 32, Macborough-street, for Messrs. J. Moore and Sons. Mr. H. G. Luff, architect, 64, Chapel-street, Devonport:—

W. J. Oliver ... £983 12 6 F. Blowey, Ply. J. Healy and Son ... 975 0 0 mouth ... £895 0 0

J. Jenkin and Son ... 973 14 6 * Accepted.

DEVONPORT—For alterations to business premises, 32, Marlborough-street, for Messrs. J. Moore and Sons. Mr. H. G. Luff, architect, 64, Chapel-street, Devonport. Quantities by Mr. Edgar W. Leest, Laboratory House, Devonport:—

W. J. Oliver ... £983 12 6 P. Blowey, Plymouth ... £895 0

J. Healy and Son ... 975 0 0 * Accepted.

T. Jenkin and Son ... 973 14 6

KNOTTINGLEY—For alterations and additions to property in the Croft, for Mrs. W. T. Crawshaw, 2, West Park-terrace, Scarborough. Mr. W. Wrigley, architect, 6, West-gate, Wakefield. Quantities by architect:—

Building—John H. Austerberry, Ferry-bridge ... £80 0 0

Slatting and Painting—A. Sutcliffe, Castleford ... 22 8 5

Plastering—G. Lockwood, Wakefield ... 8 6 0

Carpentry and Joinery—F. H. Curry and Co., Pontefract ... 52 3 0

Plumbing—E. Tate, Knottingley ... 14 10 0

£177 7 11

LANCHESTER—Accepted for laying 557 yds. of 9in. pipe sewers, with manholes, &c., at Holmside Village, for the Rural District Council. Mr. J. E. Parker, engineer, Post Office-chambers, Newcastle-on-Tyne:—

G. H. Bell, Bishop Auckland ... £158 12 6

LEEDS—Two houses, Burley Village. Fred Mitchell, architect, 71, Albion-street, Leeds:—

Brick and Mason Work—C. Lucas and Sons £280 0

Joiner's Work—William Wray ... 100 0

Plastering—J. W. Watson ... 26 10

Painter—J. Stead ... 44 15

Slatting—T. E. Heavside ... 14 0

Painter—J. Robinson ... 16 0

[All of Leeds.]

LIMAVADY (Ireland)—For the erection of a residence and offices at Main-street, for Mr. J. E. Proctor, Limavady. Messrs. W. and M. Given, architects, Diamond, Coleraine. No quantities:—

Maxwell and Co. ... £208 10 0 Thorpe and Mc-James Wray ... 812 3 0 Cracken, Lima-

John Holmes ... 783 12 4 vady, Co. Londonderry ... £759 4 6

* Accepted.

LONDON—For the execution of sanitary work at the Holborn Fire Station, for the London County Council:—

Vigor and Co. ... £215 10 0 F. and F. J. Wood ... 117 0

G. Munday and Sons ... 183 0

* Accepted.

LONDON—For alterations and remodelling bars at the "Blind Beggar" public-house, 173, Whitechapel-road, E., for Mr. Charles Martin. Mr. Ernest H. Abbott, architect, 6, Warwick-court, High Holborn, W.C. Quantities by Mr. Alfred Johnson, 30, Imperial-buildings, Ludgate Circus, E.C.:—

Dabbs ... £2,285 Hall, Beddall, and Co. ... £2,150

Fordham ... 2,271 A. E. Symes ... 1,998

Harper ... 2,267 T. Russell ... 1,973

Samuel Salt ... 2,249 T. W. Smith and Son ... 1,933

W. Antill and Co. ... 2,200

LONDON—Accepted for repairs at Nutfield House, Balham. Mr. St. Pierre Harris, architect, 8, Ironmonger-lane, E.C.:—

Somerford and Son ... £134

* No competition.

LONDON—For a detached house and stable, Pelham-road, Gravesend, for Mr. Joseph Gray. Mr. E. J. Bennett, architect:—

Fily ... £290 Martin ... £269

Tuffee ... 839 Multon and Wallis ... 798

Rayfield ... 839

* Accepted.

LONDON—For the erection of stables, mortuary, etc., in Overy-street, Dartford, for the Urban District Council of Dartford. Mr. Wm. Harston, Town Surveyor, Dartford:—

Knigh ... £2,379 Lonsdale ... £2,779

Martin ... 2,379 Multon and Wallis ... 2,513

Galer ... 2,783

* Accepted.

LONDON—For alterations and additions to the "Rose and Crown Tavern" and 171, Windmill-street, Gravesend, for Mr. H. Doughty. Messrs. Eeale and Meyers, architects. Quantities by Mr. H. Dow White:—

Gregory and Co. ... £2,275 J. M. Dering ... £3,463

Medeson ... 2,463 W. H. Archer ... 3,328

Atherton ... 3,890 W. Tuffee ... 3,270

Walsh and Son ... 3,855 Multon and Wallis ... 3,247

S. J. Jarrard and Son ... 3,528

* Accepted.

LONDON—For alterations and additions to No. 5, Whitehall-gardens. Mr. R. Curwen, architect, 149, Bishopsgate-street Without, E.C.:—

Leslie and Co., Ltd. ... £2,865 Blyth and Co. ... £2,407

W. Pattinson and Sons ... 2,750 Belham and Co. ... 2,448

D. Gibb and Co. ... 2,700 Chessum and Son ... 2,353

Ernest Wheeler ... 2,682 Hampton & Sons, Ltd. ... 2,280

Ham and Sons ... 2,670 Kiddle and Son ... 2,249

F. T. Chinchin ... 2,600 E. A. Rooome ... 2,150

H. Faulkner and Co. ... 2,556 Lilly and Lilly, Ltd. ... 2,051

Elkington and Co. ... 2,520 Spiers and Son ... 1,960

* Accepted. £2,100.

[All of London.]

Separate Contract.

For decoration of four principal rooms and hall:—

G. Jackson & Son, 49, Rathbone-place, W. ... £1,468 9

* Accepted.

LONDON—For alterations and new saloon bar at "The Falkland" public-house, 66, Falkland-road, Kentish Town, N.W., for Mr. A. L. Garrod. Mr. A. J. Perriam, architect, 43, Cannon-street, E.C.:—

King and Son ... £280 Blomfield and Evans, Rhodes ... 635 Junction-road, N. ... £587

Peterson ... 635 Green ... 585

* Accepted.

[Architect's estimate, £600.]

MANCHESTER—For the erection of new premises, Mulberry-street, Hulme, for the Grange Park Dairy Company. Mr. E. W. Leeson, architect, 49, Princess-street, Manchester. Quantities by the architect:—

Quarby and Co. ... £1,406 John Bland ... £1,400 0 0

James Byrom ... 1,456 0 0 Megarity and Co. ... 1,370 0 0

A. R. Bullivant ... 1,418 0 0 R. Whittle ... 1,348 0 0

and Co. ... 1,418 0 0 R. Carlyle, jun. ... 1,297 18 6

Young, Tinker, and Young ... 1,407 0 0 Ardwick ... 1,286 0 0

* Accepted.

MIDDLEBROUGH—For the erection of a children's hospital and porter's lodge at the Broomlands, Linthorpe, for the Middlebrough Board of Guardians. Messrs. R. Lofthouse and Sons, architects, 62, Albert-road, Middlebrough. Quantities by Mr. H. T. Neilson, Darlington:—

M. Johnson ... £4,717 0 0 D. Doughty ... £4,260 0 0

Allison Bros. ... 4,500 0 0 W. Prest ... 4,170 0 0

T. Pearson ... 4,315 11 7 Bray Bros. ... 4,141 0 0

Hudson Bros. ... 4,300 0 0 S. Coates ... 4,029 2 5

Bastiman Bros. ... 4,278 13 6 W. C. King ... 4,027 14 3

[All of Middlebrough.]

* Accepted.

RENEWICK (Cumberland)—For the erection of an oblique bridge across the Raven at Sickerkill, Renewick, for the Penrith Rural District Council:—

W. Dixon ... £815 18 0 Lightburn and T. Telfer ... 789 15 6 Sons ... £628 0 0

A. W. ... 772 9 10 Isaac Gill, Am-

W. J. Sewell ... 771 ... stable ... 593 2 9

* Accepted.

RYTON—For sewerage works at Crookhill for the Urban District Council. Mr. J. P. Dalton, engineer to the Council, Ryton-on-Tyne. Quantities by the engineer:—

G. T. Manners ... £144 6 0 A. Trench ... £115 2 10

J. Robson ... 132 14 3 J. Nevill ... 110 0 0

J. Thompson ... 128 14 0 W. Cumming ... 106 0 4

B. Baile ... 122 11 0 W. Craig, Gates-

M. D. Young ... 119 17 7 head ... 105 14 10

W. Sprout ... 119 17 7

* Accepted.

An Architectural Causerie.

Planning at Home and Abroad.

It is always an interesting and instructive pursuit to review the progress and development of Continental work compared with our own; to see how in some directions the intellect of the Latin races has reached a level that we are but struggling to attain, and how in others we are utilising knowledge and faculties that seem yet in a dormant state in our neighbours. If we pause awhile for the purpose of making careful comparison and finding where the differences lie, we shall reap our reward in coming back to our work refreshed by a clearer view of our deficiencies, tempered with a gratifying perception of our superiority in some other directions. For instance, while it would be hard to persuade ourselves that the Architecture of our public buildings approaches in artistic interest that of the best of a similar class on the Continent, when we come to look at them from the practical side we find that as regards the science of planning the latter are at least several decades behind. Not that Continental planning is not admirably adapted to produce interesting architectural effects; these, of course, are well looked after; but that the purely utilitarian side is treated in quite a primitive fashion compared with the elaborate study it has received in this country. Look, for instance, at the arrangement of one of our Municipal Buildings or Assize Courts, the successful design, may be, in a well-managed competition; what an immense amount of consideration has obviously been given to the separation of the various departments, their arrangement relatively to each other, and the avoidance of any clashing in the different routes of traffic; in the courts see what provision is made for convenience of access by the judge, the jury, the witnesses, prisoners, and public, each of these being almost entirely distinct from the others. Compare this with contemporary examples abroad; instead of a pinched-up building, pitchforked in between commercial premises, or with half its frontages abutting on narrow alleys but 20ft. or 30ft. in width, we find a massive and imposing pile, its dignity enhanced by judicious isolation from all mean and unworthy surroundings; instead of coming on our building by chance, as it were, we approach it by a noble avenue or a spacious square; but, once inside, we find it, as far as ingenuity of arrangement goes, far inferior to the cramped little concern familiar to us at home. The rooms are lofty, the corridors spacious, and everything is calculated to impress one with the importance of the building and its uses, but as regards the specific provision for its purpose, very little consideration seems to have been expended; in many cases an outline plan would hardly inform one whether the building was municipal, legal, or residential in its intention, while few modern plans in our own country would fail to show at a glance whether they were for town hall, law court, or palace. Lest we should feel inclined to congratulate ourselves unduly, it behoves us to consider whether we do not attach too much importance to our clever

little schemes for specialising the routes and entrances in our designs, and whether the Englishman's mania for privacy is not carried beyond what is either essential or desirable. If we paid less attention to these matters, and more to increasing the scale and dignity of our buildings to the utmost permitted by the site and means at our disposal, we should certainly do something to take away the reproach that our public buildings are rabbit warrens, lacking the importance that should distinguish them from their surroundings, and make them the dominating features of the cities to which they belong.

H. V. L.

The Effect of Social Conditions on Building.

In our daily practice as architects we continually come face to face with various phases of one of the great social problems of the day—the adjustment of the conflicting claims of capital and labour. While it can hardly be considered our province to concern ourselves with these matters for their own sakes, yet they interest us in so far as they affect the practice of Architecture. It is not exactly our duty to insist on the rights of the working-man to a better wage,

profit in order to obtain work, and if, after obtaining the work, a strike and rise of wages threatens to deprive them even of that nominal profit, with the result that they try to save it somehow on the building—to the detriment of the building—again it affects us to that extent. It would seem that the general tendency of human affairs is in the direction of co-operation, of collective work as opposed to individual work. In our own time we have seen the growth of large contracting firms, who do the work which, in old days, would have been done by a dozen different independent builders. It is, however, noticeable that a certain distrust of the present system is daily growing stronger; a belief that the general contractor is not quite so necessary as some people make out. We are all aware of most that can be said in his favour—that his existence seems best to fit in with the general structure of mercantile life, that by his help cheap contracts are obtained, and that the building owner would never know where he was without him. But these considerations, however forcibly they may appeal to the building owner and the general business man, are not, and cannot be, our first concern. Our first thought is for Art, our first care is to get the building properly built, and if the present contract system is found to throw difficulties in the way, to that extent it must be condemned. It seems

The Abbot's Kitchen
Glasgobary

"CHIMNEYS." SKETCHED BY CHAS. TOMLINSON.

to more leisure and opportunities for self-culture; or, on the other hand, to deplore the keen competition and the growing demands of labour, which cripple the contractor. As social problems they do not directly concern us. But if the discontent of the workman, and the conditions under which he lives and works, are such as to render it impossible for him to put his heart into his work and do his best on the building, it affects us to that extent. Or again, if the competition among contractors is so keen as to force them to cut their prices down to the merest nominal

obvious that the more direct contact there is between the men who design the building, and the men who actually carry it out with their own hands, the better for the building. The more the artisan can be got to take an interest in his work, the more intelligent will be his labour. The fewer middlemen, therefore, between the artist and the craftsman the better; and if the general contractor degenerates, as he seems likely to do, into a mere middleman and general financier, it seems evident that he is of no further use as far as the interests of Art are concerned.

And in so far as this contract system deprives the craftsman of the reputation which is due to honest and skilful labour, and tends to destroy his interest in his work, thus depriving the architect of that intelligent and sympathetic co-operation which is necessary to obtain the best results, so far must it stand condemned. There have been, up to the present, two distinct and opposite methods of conducting building operations, typified on the one hand by the system of the Greeks and the builders of the Middle Age, and on the other hand by that of the Egyptians and the Romans. In the first system we find a body of intelligent and enthusiastic workers, banded together under the guidance of a chief, every man taking an interest in the work, and feeling himself entitled to his share of the credit and reputation. In the other system we find a crowd of unthinking and unwilling slaves, under the direction of one or two men who do all the thinking for them. The first is the method which has led to the best results in the past, from an artistic point of view, but the second is the one which, in a complicated state of society, seems to produce the best results from a practical and financial point of view. In the last few years we have seen it employed with wonderful success by the Germans in the organisation of their army and their manufactures. But though a man may be able to feed a machine equally well, whether he get the credit or not, yet he cannot hammer a wrought-iron grill, or execute an intricate piece of masonry, quite in the same indifferent and cold-blooded manner, and still obtain the very best results. It might be rash to assert that artistic workmanship cannot be obtained except by following the method of the Greeks and the builders of the Middle Age. It is not so much their method as their spirit that we want. The day of the master mason, the trade guild, and the apprentice seems past; if so, it is useless to bewail it. The problem before us is to find some means whereby the principle of co-operation can be worked out in the building trades, and in such a way as to assure to every man such reward, both in money and reputation, as his work deserves. While the architect may be thankful that his Art, as a conception in the ideal world of thought, is independent of social conditions and systems of government, yet he has to remember that it is practised in a practical world of affairs of profit and loss, and that the social conditions in which he finds himself—and particularly the system in vogue for carrying out building operations—have a great influence over the realization of his ideas. It is therefore to his interest to perfect and simplify this system, to condemn any method that tends to prevent the best results; without any concern for political, practical, or financial interests, all of which are, at the present day, only too capable of taking care of themselves. A. R. J.

Maidstone and its Lessons.

It is now getting well on to three months since Maidstone was, through the apathy of its authorities and the foulness of its water supply, visited with the dread typhoid, which, sooth to say, still shows much more virulency and tenacity than could be hoped or expected. We would not have referred to this unpleasant subject were it not that the outbreaks at Lynn, Sunderland, and in our own metropolis, point a very strong moral if they do not adorn a very pleasant tale, but we must, ere it be too late, impress upon our local and other authorities the necessity of seeing that their drains and water conduits and reservoirs are put in thorough and cleanly order at once, in order

that the populations may be in the enjoyment of pure water and cleanly surroundings before the hot summer is upon us again. When we find that the water supply of London has been characterised by no mean authority as semi-filtered sewage and drainage, it behoves us to put the pertinent question to our parochial and water authorities: "Are we safe from such an attack as has visited Maidstone, not to mention other places?" And we must candidly say that we think we are not. Very little is, as a rule, done in the prevention of disease, those responsible for the health of the universe adopting a happy-go-lucky method, and trusting to good fortune to pull them through. We have only to point to Worthing, Maidstone, Lynn, and the East End of London last autumn as cases in proof of our rather free assertion—an assertion warranted by results—which epidemics, we venture to say, stand as a lasting disgrace to the powers that be. When we find that the pipes and conduits had not been cleansed for years, and that they were covered with a foul and evil fungus growth, as we did find was the case at Maidstone, and when we learn that the pipes had not been flushed for years, are we not justified in feeling an anxiety regarding the method in which we receive our water from supplies other than the Farleigh spring? It requires some such visitation as this to teach our authorities wisdom; it required the plague of London to impress upon the inhabitants of the city the virtue of cleanliness; and it was necessary to burn the metropolis down to enforce the lesson for sanitary requirements. The same occurred at Rome and Athens in ancient days, and it will ever be the same until our authorities do their duty, not intermittently as now, but persistently and constantly. Look to it, you sanitary and water authorities, and put your houses and reservoirs in order, or, if you neglect this duty, the responsibility be wholly yours, and *pour encourager les autres*.

W. N. B.

LITTLE-KNOWN CORNERS OF LONDON.

AMONG the curious corners of London, few are more interesting than the little-known sites of the old district markets which once played so great a part in the domestic economy of the metropolis. Nearly all the sites of the old markets we are considering still preserve the exterior square or oblong ring of old houses which surrounded the central market-house. All sorts of tricks have been played with the central area, but the surroundings are in general unaltered. These markets seem to have originated with John Holles, second Earl of Clare, for Howell in 1657 notes that in St. Clement's Fields the Earl has built a palace for himself, a street of houses, and a market, all bearing his name. Clare Market has long been covered with slums, which in their turn are giving way to business premises, a Government laboratory, &c. One of the latest clearances, the Colonnade, was a relic of the old market stalls. Brooke Market (now called Brooks's), at the north end of Brooke Street, Holborn, was erected by Lord Brooke after the Restoration, on the site of his town mansion. The market-house was pulled down a century ago, and succeeded by four streets of slums, which have just been cleared away to make way for "models." The old houses around the market square remain much as they were two hundred years ago. Not far away were situated

FLEET MARKET AND NEWGATE MARKET.

The former was originally the Stocks Market, removed in 1737 when the Mansion House was built to the covered-in surface of the Fleet Ditch. When the road from Holborn Bridge to Blackfriars Bridge was widened in 1828, Fleet Market was removed to a site on the west side, and re-named Farringdon Market. It then covered the workhouse graveyard

where poor Chatterton was buried, but was finally abolished four years ago, and Farringdon Avenue has been built on it. Newgate Market is now called Paternoster Square, and here again, says the Westminster Gazette, the old houses around may be clearly recognised. The square lies between Newgate Street and Paternoster Row. The market-house has been succeeded by a block of publishers' warehouses. Red Lion Market is reached by narrow courts, which approach it from Golden Lane on one side and Whitecross Street on the other. Its origin is unknown, but there is good reason to suppose that it was laid out at the end of the seventeenth century on the "upper churchyard" of St. Giles's, Cripplegate, which was closed just before the plague year because of its crowded state. Carnaby Market, or Marlborough Market, was erected on the site of the great plague pit and pest house which Macaulay mentions as existing on the east side of the modern Regent Street. Carnaby Market is now covered with grimy tenement houses in West Street, &c. Newport Market long remained in the hands of the butchers; it is now covered with tall blocks of "models." St. James's Market, established by the Earl of St. Albans in 1664, occupied the space between Jermyn Street, the Haymarket, Charles Street, and Regent Street. George III.'s Quakeress, Hannah Lightfoot, lived here in Market Street. The market was abolished in 1818. The market-house was at the end of Norris Street. Market Lane, a narrow cartway which led from Pall Mall to the market, has been

ENTIRELY TRANSFORMED,

being now represented by the covered arcade at the rear of Her Majesty's Theatre. Westminster Market is now covered by the Westminster Guildhall, and Hungerford Market, erected in 1680, by Charing Cross railway station. Oxford Market was pulled down in 1880, and Oxford Mansions, a block of flats on the north side of Oxford Street, mark its site. Fitzroy Market, on the north-west side of Tottenham Court Road, was erected by the Duke of Grafton; it was pulled down in 1875 and built on. Mortimer Market, on the opposite side of Tottenham Court Road, is but a name to-day; and Bloomsbury Market, erected by the Earl of Southampton late in the seventeenth century, is only commemorated by the name of Market Street, at the junction of Bury Street and Holborn. At the East End, Hoxton Market is now only a dreary square, surrounded by "models" off Coronet Street. The quaintest survival of them all is to be seen over the water at St. George's Market, which lies within the triangle formed by the junction of London Road and the Borough Road. Here the old houses remain as of yore, though now converted into tenement houses, but the stalls in the centre have never been demolished. Instead, some economical owner has converted the shambles into one-story cottages on one side of the square, while those on the other have been utilised as a wheelwright's shop. The arrangement cannot be commended from a sanitary point of view, and it is not surprising that the vestry has for some time been considering the purchase and demolition of these stunted habitations.

MERCHANTS and leaseholders of Finsbury Circus and London Wall have passed resolutions of protest condemning the proposal of the Bridge House Estates Committee of the Corporation to pull down the south side of Finsbury Circus as a wanton destruction of property, and the proposal to pull down London Wall and offer the site for public auction as a very unfair treatment of old tenants.

At a recent meeting of the Halesowen District Council, complaints were made that three brickworks had been erected in the parish, and no plans of the buildings had been previously submitted to the Council. The clerk said the point raised was one of considerable importance, and having well considered it, he was bound to advise the Council that it could not enforce the owners of brickworks to submit plans of their buildings.

CHIMNEYS.

BY CHAS. TOMLINSON.

PERHAPS no part of our dwelling-houses has a greater influence upon our comfort than the fireplace. The poetical quotations associated with the blaze are numerous. As Sir Walter Scott says:—

Heap on more wood! The wind is chill.
But let it whistle as it will,
We'll keep our Christmas merry still.

In dealing with this subject, I shall take the term "Chimneys" as being applied only to the stack and the flue, touching upon the fireplace no more than is absolutely necessary.

HISTORICAL.

The time, if ever such an one existed, when man was unacquainted with the element of fire must now necessarily be very remote, for no traces of such a period have been found by either geologists or antiquarians. As far as we can learn, the earliest form of hearth consisted either of one large flat stone or a number of smaller ones. These would be laid in the centre of the hut, either on the floor or in a pit dug in the ground, and the smoke was got rid of by means of a hole in the roof. It is far from improbable, though, that even this simple exit did not exist, the smoke being allowed to fill the apartment at will. Even to-day some savage tribes, viz., the Esquimaux and the Tierra del Fuegians, are no further advanced than this primitive method. A little later than this the fires were sometimes raised. We know that nearly all the nations of antiquity who laid any claim to civilisation had either stone or metal altars on which they lit the sacred fires to their gods, as, for instance, the Egyptians, Israelites, Phoenicians, and both the Greeks and the Romans. It is extremely probable, however, that in the warm and genial climate of Palestine and the adjoining countries the fires for domestic purposes were made in the open air in a great many cases.

Only one mention of chimneys occurs in the Bible—in the prophet Hosea, chap. xiii., verse 3. The prophet, speaking of the wicked, says, amongst other similes, that they shall be as "the chaff before the whirlwind" and as "the smoke out of the chimney." Whether the word used here means anything like the modern chimney or not we cannot judge. The Greeks and Romans often used tripods or braziers to carry their fires. In our illustrations is a sketch of a Roman tripod found at Pompeii.

The Greeks, however, acted on the maxim "Prevention is better than cure," and instead of inventing methods of disposing of the smoke, exercised their ingenuity in devising means of stopping its production, as for instance, having their tripods outside, burning a little incense in them, &c. The Romans also were troubled by the smoke nuisance. Even the Roman civilization got little farther than a hole in the roof with a moveable cover, however, though some of the rooms had a heating chamber underneath, in order to warm without filling them with smoke. Many of the wealthier citizens had two suites of rooms, the one for summer, and the other for winter use. We find Vitruvius recommends the decorations, &c., of the latter suite to be plain and dark-coloured in order that the effects of the smoke should not be so soon seen.

Turning now to our own country, the chimney in England was little developed until the time of Henry VIII. For long after the Norman conquest the fire was made on the floor with the customary aperture in the roof. This hole was supplied with a moveable cover of wood or metal, termed a "couver-feu" (from the French "couvrir," to cover, and "feu," fire), which was put on when the fire was extinguished. These covers gave the name to that institution of William the Conqueror—viz., the curfew, or bell tolled every evening at a certain time for the fires to be put out. Later these covers were made with louvers to let the smoke escape, and still keep out rain, wind, &c. Thus was developed the central lantern or turret, with openings for the smoke, as at the Abbots' Kitchen,

Glastonbury. This is perhaps one of the earliest chimneys in Britain. Others of the oldest chimneys are at Winwall House, Norfolk, Kenilworth, and Conway Castles, supposed to have been built in the twelfth century.

I have seen it surmised by some writer that the earliest form of flue consisted of sticks interwoven with one another and with corner posts (one side being against a wall), and then plastered both sides with clay, which would soon harden with heat. Still, we should judge this form of flue to be excessively flimsy. In Rochester Castle, built about 1130, there are complete fireplaces with projecting chimney-pieces, and formed by moulded semi-circular arches. The flues go up a few feet only in the thickness of the wall, and then out at the back. The apertures have small stones placed across them to break the force of the wind. There is a fireplace and flue somewhat similar to this at Conisborough Castle.

The next step in the development of the chimney was to carry the flue a much greater length up the wall before allowing the smoke to escape. A good example of this form is to be seen at Aydon Castle, Northumberland, date about 1280. From this stage it was an easy and natural transition to the proper chimney "stack" rising above the roof. Some

Northborough

Thornbury Castle

Layer Marney

"CHIMNEYS." SKETCHED BY CHAS. TOMLINSON.

of the earlier chimney shafts were frequently of great height, and circular; in the fourteenth century they are often found very short, as the example at Chepstow Castle. A little later the forms of shafts became much varied, being made, perhaps, square, circular, octagonal, or even hexagonal. They were often most richly ornamented, as at Northborough, Northamptonshire (date 1340). Other specimens of these octagonal shafts still exist at Burford and at Exton, Northumberland, the date of these latter being about 1350. Examples of these chimneys, however, built in the fourteenth and fifteenth centuries are rare, as they only became anything like general about the early part of the sixteenth century, when clustered shafts began to be used, as at Thornbury, Gloucestershire (date 1514). About this period also many fireplaces were added to older halls. These new fireplaces were often built of brick even in stone houses, courses of bricks being introduced occasionally in herring-bone fashion at the back of the fireplace.

Old fireplaces of about this time may not be uncommonly seen, and we all know the appearance of some of these huge kitchen fireplaces, which seem almost big enough to allow of an ox or sheep being roasted whole. John Leland, a learned antiquary, who flourished during the reign of Henry VIII., in his "Itinerary," Vol. VIII., p. 66, says:—"One thing I much noted in the Haulle of Bolton, how chimeneys were conveyed by Tunnels made on the Syds of the Wauls betwixt the lights in the Hawle, and by this means, and by no covers, is the smoke of the Harthe in the Haulle wonder strangely

conveyed." Leland's "Itinerary" is a much noted record of the author's travels from place to place, and it is evident that the "chimeneys" at Bolton must have greatly impressed the author by the fact of him recording them in his book. This is the earliest written record we have of the existence of chimney flues.

There is no reason for supposing that chimneys were much, if any, further developed upon the Continent than in England. Galeazzo Gatarro, an Italian author, who died A.D. 1405, in his "History of Padua," states:—"Francesco da Carraro, Lord of Padua, came to Rome in the year 1368, and finding no chimneys in the hotel where he lodged (because at that time fire was kindled in a hole in the middle of the floor), he caused two chimneys, like those which had long been used at Padua, to be constructed and arched by masons and carpenters whom he had brought along with him. Over these chimneys, the first ever seen at Rome, he affixed his arms which were still remaining." From the foregoing extract we may judge that Italy was no further advanced than England with regard to the methods of disposing of her superfluous smoke. Chimneys had, comparatively speaking, come into common use by the time of Elizabeth (1558-1605). We have many fine examples of brick and stone shafts of about this period remaining, as at

Layer Marney, Essex, Hampton Court, Middlesex, East Barsham, Norfolk, and at Badwell Hall, Suffolk, some of the above being most ornate. No change of any moment either in the flue or the stack has taken place since the end of the sixteenth century. The only alterations connected at all with the subject are, perhaps, in the form of the fireplace, where the iron or brass "dogs" have been superseded by the grate or "range," and from the early stone curb has gradually evolved the modern fender.

PRACTICAL.

Flues, stacks, &c., are eminently portions of a building which appeal to the "practical" man, for they are essentially useful constructions as distinct from merely ornamental ones, for by no stretch of imagination can we fancy it possible that a chimney flue or stack would be erected solely for ornament. Bricks are the material, *par excellence*, for building chimney flues. Even in stone buildings bricks are nearly always used for the construction of the chimney breasts. They are so convenient, being all of a size, for turning the multitudinous angles, that they are to be infinitely preferred to stone, though, of course, in a stone building, when the shaft reaches the roof, it must be completed in stone to match the walling.

A dissertation upon the different kinds and qualities of bricks, mortar, &c., would here be out of place, as really belonging to an essay upon building materials generally. And, of course, by the same reasoning, it is totally

"CHIMNEYS." SKETCHED BY CHAS. TOMLINSON.

unnecessary to go through all the rules of good brickwork, bond, &c., which apply equally as much to the chimneys as to the walling. The outside walls of chimney flues are usually built only 4½ in. thick, but it is much better to have them 9 in., on account of the danger from fire. The flues get extremely hot, and any wood plugs, &c., driven into the walls for purposes of affixing skirtings, angle beads, and other joinery, are liable to get overheated and take fire. Patent bricks, however, of coke-breeze, concrete, and other materials which will take nails, are now made, and may be used instead of wood plugs to avoid this danger.

In a case—as occasionally happens—where a floor beam or a roof principal runs into a chimney breast, the danger of over-heating may be avoided by either encasing the end of the beam in a cast-iron box, or, which is perhaps the better method, by corbelling out the bricks so as to carry out a stone template, upon which the beam or truss may rest, as shown in one of the accompanying sketches. In building a flue, the bricks are brought over by means of a "gathering stone," so as to form a "throat" to the fireplace, and also to bring the flue to its regulation width. This throat is formed just above the fireplace lintel or arch. The flue is usually taken to one side of the breast, and then carried up as straight as circumstances will allow, though, oftener than not, the flue has to be twisted more than once, by reason of the fireplaces above. But every flue, even one from an attic fireplace, should have a little curve from the perfectly vertical given to it, so as to prevent snow, rain, &c., from coming down on to the fire. Flues are much better gathered together into a stack, than if taken up singly. The reason is that a more equable temperature is preserved among them, and they are thus rendered much less likely to smoke; also, they are decidedly more stable in a strong wind. This system of taking up the flues together can be easily carried out where fireplaces occur one over the other, and, in the usual type of terrace houses, with fireplaces in the front and back rooms, the flues can easily be brought together in the false roof and formed into a single stack at the ridge. A very sharp angle, that is one under 135 degrees, necessitates an iron soot-door being built just at the turn, in order to effect an easy removal of the soot which is apt to collect at an angle. The soot-door at an angle of 135 degrees is a requisition in an Act of Parliament.

The ordinary size of a flue is 14 in. by 9 in.; for large kitchen fireplaces 14 in. square is sometimes built, and for very small bedroom fireplaces flues 9 in. square are quite big enough. During its erection, the interior of a flue should either be rendered in Portland cement or else pargetted with mortar. This rendering, of course, affords the smoke an easier chance of escaping. In the twisted portion of a flue the overlapping courses should have their corners knocked off, the angles on the other side being filled up flush with mortar. Flues are sometimes pargetted with a mixture of lime and cowdung, this material being tougher than mortar and less liable to crack with the heat. In some cases glazed earthenware socketed pipes of 9 in. diameter are built in inside the flue. This system gives a very smooth and easy passage for the smoke, though it is sometimes objected to on the ground that when the surface is so exceedingly smooth the soot is apt to collect and fall in lumps. Also iron flue-plates with flange joints are a recent invention. These may be used in the place of the ordinary brick midfeathers, thereby much lessening the size of the stack.

When the shaft reaches the roof the remainder of the brickwork should be built in cement, and be finished off to match the external walling. This often necessitates a good deal of cutting of the bricks to form the bond, and great care should be taken to see that the midfeathers are all well bonded with the outside walls and with one another. The flues are usually completed with glazed earthenware chimney-pots, which should be carefully fixed in cement. The roof timbers should always be trimmed to avoid the chimney stacks, and not run into them, as is too often the case. At the junction of the slates or tiles the brickwork should be properly flashed with lead to avoid water getting in at the junction, and a small lead gutter should be formed on the top side of the stack. But that nineteenth century production, the "jerry builder," is, however, quite independent of any lead flashings. A fillet of mortar just run round the brickwork and slates constitutes to him a quite sufficient protection from the weather.

(To be continued.)

THE dispute at Penrhyn, Cornwall, between Sir John Jackson and the stone masons engaged in raising stone for Keyham Dockyard extension works, has been settled.

ANCIENT BUILDINGS.

PRESERVATION AT HOME AND ABROAD.

A NEW north-western tower is to be added to Chichester Cathedral. It is, of course, no news to those interested in our ancient buildings, says the Daily News, in commenting on this fact, that the West Front of Chichester Cathedral was destined to fall, like the West Front of Peterborough, into the hands of the destroyer under the name of restoration. But the letter from the Society for the Protection of Ancient Buildings, stating that a contract had already been entered into for the pulling down of the old and the erection of a new north-west tower, is a severe blow to those who hoped that want of funds might prevent the attempt to carry out the design till some general measure had been adopted to control such design. In this connection the recent publication of the last annual address of the, alas! that we should have to say the late, President of the Society of Antiquaries comes in with great appropriateness. The remarks of Sir A. Woollaston Franks, who has enriched the department of the British Museum over which he presided with the most splendid additions at his own cost, would in any case carry great weight. Written as they were within a few days of his death, when the shadows were already gathering round him, they come with even prophetic force. After recounting the efforts made by himself and the Society to save the West Front of Peterborough, and expressing grave doubts whether "the restoration of ancient buildings should be confided to an eminent architect whose business is rather to construct new ones," he, a Conservative and a staunch supporter of the "Establishment," addressed this

WARNING TO THE "RESTORING" FANATICS:—

"It need scarcely be said that the political aspect of archaeological questions does not in any way concern this Society. But it is scarcely to be expected that the high-handed action of the Dean and Chapter of Peterborough Cathedral in a matter which should have been the subject of their grave deliberation will be forgotten by those political parties who are opposed to the existence of all Deans and Chapters. This controversy, therefore, though it seems now to have resulted in a victory for the Dean and Chapter and the advocates of 'restoration,' may have sown

seeds that will bear bitter fruit for the Ecclesiastical foundations of England. However this may be, one pleasing feature is the number of letters that have come to the Society, not only from sympathetic strangers, but from practical men, architects, and builders, asking for copies of the Society's statement and the specification, that they may make use of the more conservative method there advocated in work in which they are engaged. Not only from these, but from clergymen in all parts of the country, who are anxious that their churches should benefit by the adoption of the better, and generally cheaper, plan, similar appeals have been received. It is thus not easy to estimate the good that will result from the sturdy fight that we have made for the preservation of Peterborough Cathedral, a fight with which, as I said before, we have reason to be satisfied, though the victory is claimed by the other side. The partial destruction of the west front of Peterborough, and the threatened disfigurement of St. Cross Hospital, near Winchester, by their legal guardians, have again shown the urgent necessity that exists for some legislation to enforce publicity, and the restraining influence of some external sanction, before the trustees of ancient monuments are allowed to destroy or deface them by so-called restorations or

INCONGRUOUS ADDITIONS."

He then pointed out that in April, 1896, long before the "Peterloo" of anti-restorers was imminent, the Society had taken a most important step in this direction, by obtaining through the Foreign Office, which showed the most sympathetic interest, returns as to the existing legislation on the subject in foreign countries. A summary of these returns, which will in due time appear in the form of a Blue Book, follows. It is too long to quote in detail. But apropos of France, which was "held up as a 'shocking example' of the evil results of putting ancient monuments under State protection," it is remarked that the law giving this protection "was only passed in 1887, and the Commission to enforce it only instituted in 1889, when the destructive restoration, which is worse than neglect, had already marred several of the finest mediæval buildings in the country. It should also be remarked that, unfortunately, owing to all the churches and most of the castles being vested in the State, the regulative and restraining authority is only to a slight extent differentiated from the initiating and executive authority over ancient buildings. The final authority both for proposing and criticising restoration is the Minister of Fine Arts, and the very architect to whom he may have to look

FOR RESTRAINING RASH RESTORATIONS

may be the architect who, for the sake of a lucrative job, has already proposed it." In Germany Bavaria takes the lead, "where stringent and admirable legislation has existed for many years." Since 1872, "if public (including Ecclesiastical) buildings are proposed to be restored in any important particular externally, the plans have to be submitted to the Crown. They are examined by a committee of Public Buildings, . . . from an artistic and historical point of view." "As regards interiors, an order was issued in 1895 forbidding any restoration until the plans had been approved by the Department" of Education and Public Worship, in the case of churches and colleges, War Office, or as the case might be. In all cases now the Department is guided by the "Board of Trustees of Bavarian Ancient Buildings. This is constituted of four persons who are authorities on the history of Art, the architect, the artist." "Not only are the clergy not allowed to pull down their churches, but they are not encouraged to expect promotion by what the Department calls 'the restoration mania.'" In Belgium, since 1835, there has been a

"ROYAL COMMISSION OF MONUMENTS"

to advise on repairs required for monuments "remarkable for their antiquity, their associations, or their historical value, as well as on plans for the construction of new places of worship, or the restoration of old ones." The

Commission has five year scholarships for architects "regularly instructed in the true principles and practice of the restoration of ancient buildings." In Rome, since 1820, has existed "the first example of a Government Commission for the preservation of historical monuments and antiquities, composed of a high State official, Inspector of Fine Arts, Inspector of Public Pictures, the Commissioner of Antiquities, the Director of the Vatican Museum, the Professor of Sculpture, and Professor of Architecture in St. Luke's Academy." No church or other ancient building may be touched without their consent. In Sweden and Norway churches "'distinguished by unusual Architecture or ancient ornaments, or to which historical memories cling,' may not be demolished, altered, or turned to other uses without the Royal consent." "There is a State Antiquary kept, who may be called in by the Archaeological Academy." The general result is thus set out: "On a general survey of the information given in response to the Society's inquiries, it appears that every State

has been paid to the so-called rights of private property, are precisely the countries in which there is the most immediate hope of future measures in the same direction. The next most important work, the formation of an Inventory or Register of Ancient Monuments, whether prehistoric or historic and artistic, whether the objects included in it are or are not placed under the protection of the State, has been attempted in Italy, France, Spain, Austria, Bavaria (so far as concerns prehistoric monuments), and Greece. It is with great satisfaction that the Society, through its representative, Mr. Philip Norman, has taken part in the movement initiated by the London County Council, for the formation of a similar register for London; while, in pursuance of a promise given to the Society on the occasion of its attempt (too late) to save the Rolls Chapel, the Chief Commissioner of Works, Mr. Akers Douglas, has furnished Parliament with a return of the ancient public buildings under the charge of that department." "CHIMNEYS." SKETCHED BY CHAS. TOMLINSON.

in Europe, except Russia, does more for the preservation of its historical monuments than our own; and we are only so far in advance of Russia in that we once passed an Act for the protection of a limited class, and that in an artistic and historical sense, the least interesting class of monuments; which was almost at once practically repealed by administrative obstruction. Italy, and in Italy Rome, may be regarded as the original parent of all legislation on this subject. Its principal work, the establishment of a Commission, comprised of officials and experts and artists, specially charged with the

PRESERVATION OF HISTORICAL MONUMENTS,

has been followed by France, Spain, and Belgium, among Latin countries; by Austria, Bavaria, Saxony, Holland, and Switzerland among Teutonic peoples; by the Scandinavian countries, and last, but not least, by Greece. It is noteworthy that those countries like Italy, Greece, and Sweden, in which legislation, though not perhaps the best enforced is the most stringent, and where least regard

the Daily News concludes, show the urgent need that there is that we should follow the example of the most enlightened countries of Europe, and control our restoration maniacs. The letter mentioned above, from the Society for the Prevention of Ancient Buildings, is as follows:—"The Committee of the Society for the Protection of Ancient Buildings desires that you will kindly give it the opportunity of making it known to all lovers of mediæval Architecture that a new north-western tower is to be added to Chichester Cathedral. In calling attention to this after a contract had been entered into, we would explain that we had not contemplated the possibility of the Dean and Chapter going forward before larger funds were at his disposal. In 1892, the late surveyor to the Cathedral made a long and detailed report, stating what repairs the Cathedral Church needed, and among other necessary repairs was included strengthening the western bay of the nave. Shortly afterwards it was suggested that a new north-west tower should be built. But very little has appeared in the public Press upon the subject

"CHIMNEYS."

except a letter signed 'A Sussex Churchman,' strongly opposing the scheme, which appeared in *The Times* of September 14, 1897, and elicited no answer. Our Society has now received a copy of *The Chichester Diocesan Gazette* for this month, which contains a drawing of the proposed new tower without an architect's name attached to it. It is to all intent a copy of the existing south-west tower. There is also an article stating that a contract has been entered into for building the first 46ft. of this new tower, which is about half the proposed height. The south wall will be formed by adding to the height of the western bay of the ancient north arcade of the nave, and its eastern wall, by carrying up the western wall of the north aisle of the nave. It is the opinion of three architects from this Society who visited the church recently, that the ancient work could, without risk, be repaired and secured, but that to incorporate it into

A USELESS NEW TOWER

and make it carry additional weight would be unreasonable and dangerous. It must not be forgotten that the magnificent campanile stands within a few yards of the site of the proposed sham Norman tower. The question, therefore, arises: Is it desirable to risk the sacrifice of the ancient work—a beautiful example of Norman Architecture—for the sake of an imitative tower? We gather from the drawing referred to that as parts are marked 'old' it is suggested that the unknown architect might retain the existing work and build on to it; but it must be pointed out that a common procedure in these cases is to begin on some pretext and then to put forth supplementary reports saying that the work proves to be so dangerous that notwithstanding the architect's best intentions, it must be entirely rebuilt. My Committee wishes the alternative proposals for dealing with this angle of the building to be clearly understood. On the one hand a scheme of repair which they have only just laid before the Dean and Chapter could be carried out without danger or the

addition of any imitative work, and large sums of money might be saved towards the general repairs which, according to the Cathedral surveyor, are so sorely needed. On the other hand, these needful repairs may still be neglected and the money spent in a brand new and worthless tower, the attempt to erect which may lead to a large destruction of the original work of the twelfth century. It must further be pointed out that it was the avowed scheme two or three years since to build this modern tower as a preparation for a spire, and also to add a new spire to the south tower, thus risking the safety of that tower also by the additional weight, and smothering the lovely old work in modern trivialities. We hope that the opinion of the public will yet lead the authorities to give up their destructive scheme."

THE Hermitage Gallery at St. Petersburg, which contains some of the finest pictures in the world, is closed for a year, in order to allow time for a thorough restoration of the buildings.

THE SITE OF MILLBANK.

A GOOD deal of disappointment has been expressed in one or two quarters that the ten acres which old Millbank Prison took up should not have been kept as a public park for the poor of Westminster and Lambeth to breathe in. There is very little probability that the destination of the site will suffer much change now, in spite of this disappointment, for on the half of it which the London County Council has taken for workmen's dwellings the drains are already being seen to and the roads are already being laid down. But the case is not quite so bad as the Public Places Preservation people would have us believe, for the County Council is doing its best to make the new area a model one in its way. It will be spacious and airy; it will have baths, washhouses, and a Board School; and, since the poor must be housed somewhere, and remembering that this special site was selected in order to accommodate the poor people who will be turned out of Clare Market in order to make room for other London improvements, it may be in some sense as great a boon as if it were devoted to the purposes of a park. As a park it might, not improbably, have so raised the value of property in the neighbourhood of Westminster as to confer a benefit on the middle classes, who would have come to live there in flats. As a poor man's village it may raise the tone of the Westminster slums, and it will be a boon to the Clare Market people, whom it will house at a distance not too extensively distant from their means of livelihood in Covent Garden. The area will be split up into blocks of dwellings; and the whole 8½ acres will accommodate 4380 persons—roughly speaking 500 to the acre. The plans of the houses are not yet finished and approved, but they may be said in a general kind of way to follow upon the models of the County Council's improved area at Boundary Street, Bethnal Green—an area with which in its unimproved condition the public was lately made familiar under the title of "Old Jago." The roads are all to be 50ft. in width, and all the rooms of all the houses are to have what is called a "forty-five degrees lighting," which is to say that from every room the dwellers will be able to see the sky. There is to be a public garden which, as can be seen from the plan, faces the Tate Gallery, and so the outlook from this building will at any rate be well preserved. A further tribute of respect to British Art is to be paid in the names of the buildings, which will be named after British painters—not excluding the water-colour men, and including Mr. Ruskin. The last two Presidents of the Royal Academy are thus to be immortalised. It is not easy to say when the scheme will be finished, for the Council is anxious to make the erection of some of the dwellings contemporaneous with the demolition of parts of Clare Market and the removal of the district's population. But since the Board School is to have a playground, and the two spaces on either side of the Tate Galleries are to have barrack yards, enough has been said to show that the Millbank site should be a healthy and an airy one.

RENAISSANCE ARCHITECTURE IN MALTA.*

By A. S. FLOWER, M.A., F.S.A.

MR. ARTHUR S. FLOWER, M.A., F.S.A., in a paper on "Renaissance Architecture in Malta," alluded, in opening, to the ignorance and erroneous impressions that generally prevailed about Malta among English people, and to the scant regard paid the island by architectural writers. Small as it was, Malta teemed with huge buildings, the product of centuries of activity and ambition. Churches, palaces, castles, possessed a character, unusual, striking, commanding, which rendered it to the lecturer's mind one of the most interesting spots in Europe. The island was composed of one solid block of almost perfect building stone. A house might be built from the stone cut out from its own cellars, a fortress from its own moats, a cathedral from its crypts. Stone was the one material employed in buildings, and was extensively used for other and many novel purposes. It might be described as a mason's earthly paradise. The inhabitants seemed to be born masons. No higher testimony could be given to the beauty and interest of the buildings than the enthusiasm they aroused in the cultivated and critical mind of the late Dean Church, who thought Valletta one of the most striking specimens of Architecture he had ever seen. Some interesting passages from the Dean's published letters were quoted, describing his first view of the capital, and of the general aspect of the interior of the island. Besides the ethnological and geological conditions,

THE POLITICO-RELIGIOUS INFLUENCE.

exerted by the Knights Hospitallers had been an important factor in the architectural development of Malta. Its architectural splendours were chiefly due to them. Relics of former rulers—the so-called Phœnician remains, fragments of Greek and Roman structures, various beautiful evidences of Sicilian-Norman influence—the lecturer passed over as belonging more to archaeology than to Architecture. His purpose was to deal with buildings still in regular occupation and use, belonging to a style most conveniently to be described as Renaissance. These were erected during the palmy days of the Knights of St. John, from the beginning of the sixteenth to the beginning of the eighteenth century. In explanation of how they came into existence, the lecturer briefly sketched the history of the order, and the various vicissitudes it passed through from its foundation in Jerusalem early in the eleventh century till its establishment in Malta. This happened in 1530, when the Maltese islands, at that time little better than desolate barren rocks, were ceded to the hospitallers in perpetual sovereignty. Fear of Turkish attacks compelled them to devote their first years to necessary fortifications, nearly all to be reconstructed after the great siege of 1565, when the Turks were finally repulsed.

THE CREATION OF VALLETTA,

a city which suddenly sprang up on a very unpromising site, never before occupied by buildings, was entirely the work of the Grand Master, La Vallette. The first stone was laid on March 28th, 1566, at the corner of St. John's bastion, La Vallette taking up his abode in a wooden hut on the spot, and directing operations day by day until his death in 1568. Del Monte, the new Grand Master, took equally great interest in the work, beginning his term by announcing that no one should enjoy his favour who did not promote the building of the city. At La Vallette's death nothing had been built except the outer fortifications. The first house, interesting as forming the nucleus of the present Governor's palace, was built by the Grand Master's nephew, Eustachio del Monte, in the centre of the high ground, on the place occupied by one of the Turkish batteries during the siege. In the next year,

1570, the designing of all the works, military, civil, and even ecclesiastical, was entrusted to Gerolamo Cassar, a very remarkable man, whom a document, dated May 18th, 1581, refers to as the "ordinary architect and engineer of the order" from 1565 to 1581. The most notable of his numerous works was the Church of St. John. In 1571 the headquarters of the order was transferred to the unfinished city. The lecturer gave a detailed description, illustrated by photographs, of St. John's, Valletta, and other buildings and

ARCHITECTURAL FEATURES OF NOTE IN THE CAPITAL

and other parts of Malta. The Great Hospital was one of the first buildings erected by the Knights, and always maintained on a lavish scale of expenditure. It is noteworthy as containing the largest ward ever built, 503ft. long by 35ft. wide, with a shorter ward of the same width leading out of it. Valletta alone has twenty-four churches, many of them splendid buildings, besides chapels and oratories. Outside Valletta, in the suburbs and country villages, there are a still greater number of churches, together with almost innumerable detached chapels. The latter are mostly octagonal in plan, and domed, with very graceful outlines. The larger village churches have usually two western towers and a dome at the crossing. The dimensions of two typical churches, both dating from the seventeenth century, are:—Zeitun Church, 153ft. long and 111ft. broad, including side chapels, with a nave 31ft. wide; and Zebbug Church, 165ft. by 122ft., and 32ft. across the nave. Città Vecchia, or Notabile, originally the chief city of the island, and the scene of St. Paul's sojourn there, is exceedingly picturesque.

ITS ROMANESQUE CATHEDRAL

was destroyed by an earthquake about 200 years ago, and the present building, of which Lorenzo Gafà, a Maltese, was architect, was consecrated in 1702. Noteworthy are the nave, upwards of 36ft. in span; the carved and inlaid choir-stalls, said to date from 1480; and the gorgeous altar ornaments and other treasures which escaped pillage by the French in 1798. The lecturer concluded with a few remarks on the characteristics of the Architecture of the Order. The term Palladian applied to it by Dean Church he considered inappropriate; it was more akin to early Florentine Renaissance than to any other type. With regard to a suggestion made by Mr. Ingress Bell in "An Architect's Notes in Malta," that Spanish architects in great numbers were employed upon the city of Valletta, which he thought accounted for the similarity between the Architecture of Malta and that of some of the Belgian towns, the lecturer, while granting the resemblance to Spanish work, particularly in ornament, could find no evidence of the actual presence of Spanish architects. Whencesoever derived, all the buildings of what might be called the heroic age of the order were exclusively Doric. Drawing attention to the photographs exhibited, the lecturer pointed out that being of a later date, perhaps they did not bring out the real Architecture so well, as in many cases plain buildings had been overlaid with decoration and ornament.—Colonel Prendergast, moving a vote of thanks to the lecturer, observed that what he had truly said, was that Malta to the general British public was a closed book. Many of them—and he was one—could not lay any claim to a knowledge of its great architectural productions. The material alone which the builders had at their disposal, was a great joy to anybody interested in works with which they were concerned. It was most beautiful material, and they could almost manipulate it like chalk. It lent itself to decoration, not merely of the soft kind, for it hardened with exposure, and became most charming decorative material to deal with. That in itself was a great recommendation. The points that had been brought before them seemed to be of so much interest, because it was almost unique to find such buildings erected, so to speak, for an employer, for the Grand Masters

of St. John's were very great personages, and had funds at their disposal to a large extent, and, as they saw, they had used them pretty freely. What perplexed the speaker was Mr. Flower's criticism of

THE CHURCH OF ST. JOHN.

He had no lengthy knowledge of it, but he had been in it, and thought there was something exceedingly plain about it. It was almost as flat a roofed building as they could have. It was out of proportion; the height was altogether wrong, but it had been so skilfully dealt with that it would be hard to say anything against it. Whenever discussing these things, people would not recollect the reasons for which they were done. Buildings were not erected then for the reasons they were now—because somebody wanted a pretty church. They built them for the sake of having a church, and the reason for the Church of St. John was to have half-a-dozen lodges and the Order, whose business it was to do the work in their different countries. This church was merely a series of chapels belonging to different countries, and the architect who was given the work, being a local man, had not very far to go for a sample. There was the small church close by, which he thought was a beautiful thing, but it was

AN EARLY RENAISSANCE BUILDING

in its way, and the architect simply carried out his work with that idea, and made each of his chapels, more or less, so as to have some relation to it, even though it was so very obscure. It was before the time when they had the notion to reproduce great Roman buildings or something of that kind, and he had got rid of the heavier appearance. He thought such an architect deserved enormous credit.—The Rev. W. K. R. Bedford, who seconded, said he knew Malta perhaps as much as any Englishman. With regard to the roof of St. John's Church, of course it was original. A great deal of the church was much more modern. Most of the ornamentation dated from 1660 or thereabouts, but the roof was part of the original plan. Close by, there was the little church of about 1530, and by the photo they would see there was in it very much more decided Gothic and pointed arch feeling. To some extent it was done away with in the Church of St. John, but still the family likeness was preserved between the two churches. Therefore they might take it as the first building of the Knights in the island. He would like to call attention to a very important fact that occurred subsequent to the first erection at Valletta. Though the Italian influence prevailed to a great extent, there were two great waves of reconstruction which passed over the fortunes of the Order. The Spanish Grand Master, and a great many of them that came in succession, brought in Spanish ways, and they found Spanish balconies fixed to Italian buildings. There were one or two very interesting specimens on the hotels. The last Grand Master ornamented some very handsome buildings, but more in the French style, and so they had the very nondescript styles one with another, expressing in artistic degree the buildings in order. He was sorry to say that as the leases of the fine old buildings—not those employed as Government offices—expired, they were being turned into flats, and that the era of the jerry builder had set in in Malta. He hoped all the influence that English architects could bring to bear on the subject would be exercised as much as possible.—Colonel Hogg, Mr. T. Blashill, and the President also took part in the discussion.

The French Chamber has voted to hand over the Pavilion de Marsan to the Union Centrale des Arts Décoratifs for the purposes of a Museum of the D corative Arts akin to ours at South Kensington.

The much-needed re-construction of the Llanfyllin Town Hall, which was to have been carried out as a memorial of the Queen's Diamond Jubilee, has had to be abandoned by the Town Council, in consequence of the opposition of the owners of adjoining property.

* Extracts from a paper read before the Royal Institute of British Architects on Monday night.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
November 17th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE Athens Archaeological Society has decided to resume the works for the restoration and strengthening of the ruins of the Parthenon. The English company which is working the marble quarries at Pentelicos has offered, for the purpose, marble blocks of excellent quality and large size. Fears are expressed in certain newspapers regarding the solidity of the Olympian Museum, where the famous statue of Hermes, by Praxiteles, is deposited. This anxiety is, however, quite groundless.

IN a recent address on "Art," Sir Wyke Bayliss, President of the Royal Society of British Artists, asked what was Art but the science of beauty, and what was sanitation but the science of health? Could they not make their great cities more habitable, more lovely? That was the question for consideration, and he would submit six propositions. First, that the progress of Art in our country, and the further development of some of its characteristics, have been arrested, and are now seriously impeded by the foul condition of the atmosphere of our great cities; secondly, that the constructive arrangements and appliances necessary to avoid that evil are not irreconcilable with the laws of beauty; thirdly, that the law of beauty, as well as the law of health, is that things are right only in their right places; fourthly, that if we do nothing better with works of Art than to smoke them black like fitches of bacon, our artists would certainly not fulfil that law of supply and demand and give us works of Art suitable for that purpose; fifthly, that any great scheme for the future of national and historic Art is practically hopeless so long as this state of things continues; and, finally, he put it to them that to find a remedy for those evils they must not look to the artist, for the artist looked to them to see justice done. Having referred to the chief forms of Art, he suggested that the nation through its representatives should choose the event, and the artists should choose the man who should paint one picture every year of the chief events of the year, or the most noble deed done, or the highest good achieved. That would, indeed, be true historic Art—the marriage of Art and history.

A LICH GATE has just been erected at Hooton Pagnell Churchyard. Although a pretty feature in many counties in England, lych gates are, at best, rare in Yorkshire, so far as we recollect. We only remember, indeed, two old ones in the county—one at Durnsal-in-Wharfedale, and the other at Birstal. There are, however, more or less satisfactory modern examples to be seen at Lythe, near Lord Normanby's seat (Mulgrave Castle), as well as at Giggleswick, Skelbrook, Acomb, Rothwell, Horbury, Thornhill, and at Airmin Church, near Goole. Though an extensive literature has gathered around the church and its customs, the references to lych gates, even in standard works upon Ecclesiastical Architecture, are meagre in the extreme. It is not at all

clear when lych gates, picturesque features of rural churchyards as they are, first originated. Parker, in his "Glossary of Architectural Terms" (1869), gives an illustration of one at Parsington, in Oxfordshire, which is probably of fifteenth century workmanship. They are sometimes built entirely of stone, but more usually they are dwarf walls of that material, upon which rests the structure itself framed in sturdy "hearts of oak." In Cornwall, "down-a-long" in the south-west, there is often a large block of the grey granite of the district in the midst of the lych gate, known as the "lich stone."

ARCHITECTS have lately been discussing the advantages to be derived in the winter by double glazing our windows, to prevent, during severe cold, the rapid cooling of the air inside the apartment, and, consequently, the unique extraction of warmth from the bodies of the occupants. This proposal is "made in Germany," and such windows are in vogue throughout Russia and in Canada. With an air space of about half-an-inch between the two sheets of glass, greater comfort, if not increased health, will, it is said, accrue to the inmates of houses fitted with such windows. All who sit near the present single-sheeted windows in cold weather must have experienced the sensation of draughts caused by the chilling of the currents of air, while it is also claimed that the double glazing deadens the noise of street traffic.

THE Asylums Committee of the London County Council will shortly ask the Council to sanction a large expenditure for the provision of temporary buildings, for the accommodation of female lunatic patients on the Horton Manor Estate, Epsom. It is on this estate that the Council is about to erect a permanent asylum, but, as this cannot be finished before the end of the year 1900, it has become necessary, owing to the inadequacy of the vacancies occurring at the London asylums to meet the demands for recent cases of lunacy, to immediately provide further accommodation. The Bexley Heath Asylum, which is now being constructed, will not be finished until the beginning of 1899. The primary cost of the proposed buildings, which are designed to be occupied for 15 years and to accommodate 700 female patients, is £147,000.

APPROPOS the remarks made at a recent meeting of the Architectural Association, with respect to panic precautions in churches, the following case is specially interesting. During a recent service at Marylebone Presbyterian Church a loud explosion occurred, followed by dense clouds of vapour, which rose from the centre of the building. The church, which has accommodation for 1500 persons, was at the time well filled, and a scene of great excitement ensued. The congregation rose *en masse*, and there was a rush to the exits, but at this particular stage of the service the doors were closed, and difficulty was experienced in opening some of them in time to avert a pressure of the people. This considerably added to the panic. It was ascertained that the explosion occurred in one of the pipes in connection with the hot water heating apparatus situated beneath the floor of the church. Despite the efforts of the Rev. George Jackson and officials to reassure the people a number left the building, and after a brief interval the service was continued to a much decreased congregation. As far as is known no one was injured in the church, but in the stampede from one of the galleries a person was thrown down in the crush and somewhat hurt. The damage was confined to the lecture hall beneath the church.

HOLBORN is now, and will be for some time to come, in a great state of change. We have chronicled the demolition of the Old Bell, and the Black Swan Distillery, and now Furnival's Inn is about to disappear. It is many years since it was an Inn of Court, but a reminiscence of its connection with Lincoln's Inn may yet be seen carved on the keystone of the archway leading from Holborn, in the

form of a shield bearing the arms of the Inn. Beneath are the initials T.N.G.C., with the date 1818, of which the explanation is that Nathaniel George Carter was Treasurer of the Inn during that year. When Furnival's Inn is rebuilt as residential flats, a literary landmark will be swept away, for Dickens had chambers at No. 15, until 1837. A medallion has been placed on the wall to record the fact.

"As an architect I have not been able to avoid noticing the alteration during the last few years in the way in which the workmen proceed in carrying out their duties, and I will," writes "A London Architect" to the Times, in referring to the engineers' strike, "as briefly as possible note some of the facts which have presented themselves to me:—1. There is a clearly-organised and, indeed, compulsory arrangement that the men are to consume the greatest possible amount of time in producing the smallest possible amount of work. 2. And there is an intolerable amount of interference on the part of the men as to the manner in which a builder is to conduct his business. As to 1. Bricklayers who have been many years in the employ of a certain contractor, and perfectly willing to do an honest day's work, have been compelled to restrict themselves to laying not more than 450 bricks per day, when they could, in certain work, easily lay 1000, and they dare not disobey the order. The men generally will stand in groups idling away their time, and will boldly grin at any one who, by an understood look, expresses surprise at their audacity.

"This," "A London Architect" continues, "is particularly conspicuous in the men employed by the Works Department of the London County Council and by the workmen employed by vestries and electric lighting bodies. There are some kinds of work where "elbow-grease" is required. I have been shown men who appeared to be doing real work, but who were not applying that "elbow-grease" which was necessary for a paying result and so on. Then as to 2. I had to pave a large building with granolithic paving. When about half of it had been done by men thoroughly competent to lay it to the proper falls and to arrange and set out the channels for water, the plasterers took it into their heads that they were the proper men to do this work, and told the builder that unless he allowed them to do it they would all leave the job. He had to comply, and the result is that the work cost him more money and is inefficiently performed both as to falls and finish. A bricklayer was building a manhole to a drain the other day, and was finishing the inside with a coat of Portland cement. Again the plasterers waited upon the foreman and told him that unless they were allowed to do this little piece of Portland cement work they would all leave the job, and again the builder had to succumb. The constant interruptions on works because unionists will not work with non-unionists are well understood by all, and I myself have known of the losses incurred by builders because of the tyranny which one set of workmen exercise over another."

IN the last British Consular report from Kiu-kiang reference is made to the once famous pottery of Kinté, in the Kiang-si Province, which has of late fallen into decay. This celebrated factory first became famous about the commencement of the Sung dynasty, in the tenth or eleventh century of our era, and down to the present time has furnished four-fifths of the ware of China. It outstripped its great rival Poshnashien, in Shan-tung, which furnished in ancient times the beautiful porcelain that went overland through the Gobi desert to the Bactrian cities and westward to Persia. Even now some of the best porcelain used in the Emperor's palaces is from Poshnashien. The first era of great prosperity in the history of the Kinté pottery was about the end of the eleventh century, and the most famous pieces of porcelain, in the eyes of Chinese collectors, come from this period, and are known as Sung Yao, or the work of the Sung kilns, Sung being the then reigning dynasty. The jars, flower pots, vases, &c., produced at this

time fetch very high prices. There are some vases and statues of Buddhist saints now in the palaces in Peking and Eho Park which are valued at more than their weight in gold owing to the rarity of this class of ware. The second period of fame of Kinté was during the Ming Dynasty, and especially towards the end of the fifteenth century. The cloisonné ware of this period was unequalled by any produced before. The few specimens in the Peking palaces are carefully stored and taken out only when the reigning sovereign wishes to admire them or show them to the Court, after which they are again carefully wrapped up and stored away. The third era of the glory of Kinté was during the great reign of Kanghi (1662-1722), after which it declined, and, though attempts were made in the first half of the present century to arouse the energies of the makers and the old glory of the factories, they were not successful, and now the products are coarse and mediocre, except a few pieces sent once every three years by the Governor of Kiang-si to the Emperor. Agents are specially appointed to superintend the making of these. Sometimes also wealthy Chinese order special ware from Kinté, and the work on this is frequently very fine still. The flood of cheap Japanese ware, usually in imitation of Chinese, which is entering China has affected the Chinese potter. "The decadence which has been the curse of this Empire generally has not spared the Art which formerly gained for China a world-wide reputation. It is as if the well-known ceramic Art establishments of Dresden and Sèvres had descended to supplying the world with toilet sets and ordinary household utensils, useful and cheap, perhaps, but devoid of artistic merit. Unfortunately, this decadence not only affects China from an æsthetic point of view, but has a ruinous effect upon the material prosperity of the district, for the Kinté potteries now afford employment to but a tithe of the workmen who were engaged there fifty years ago. There are immense possibilities for the future as there have been for the past; and it only requires some energy and determination to arrest the downward course and restore the Kinté potteries to the honourable position and state of prosperity which they held unchallenged in days of yore."

At a recent meeting of the London County Council, held at Spring Gardens, on the report of the Improvements Committee, which recommended "that £16,620 should be contributed by the Council for the widening of Ludgate Hill, between St. Martin's Court and Pilgrim Street," Mr. C. Harrison, M.P., proposed an amendment to refer the matter back to the committee, but after discussion, the amendment was rejected by 57 votes to 50, and the recommendation was agreed to, with the addition of words to the effect that the contribution should only be paid on an admission in writing from the City that it should be taken as a final settlement of all outstanding claims for improvements from the City of the Council. The Parks Committee presented a report relative to the contemplated closing of a small open space—Russell Court Playground—situated between Catherine Street and Drury Lane, which, it is believed, is the site described in Dickens's "Beak House." The Duke of Bedford contemplates carrying out some improvements in the district, which includes the formation of a new street across the playground. The Committee stated that it regretted the loss of this children's playground, which was much used, and of great service, but in the circumstances there was nothing left for the Council to do but to return the ground to the charge of the owner, the rector of St. Mary-le-Strand. It submitted a recommendation to that effect, but on the suggestion of Mr. Beachcroft, the chairman of the Committee, took the report back for further consideration.

MR. MARK H. JUDGE, of 7, Pall Mall, wrote a few days ago:—I am pleased to say that very considerable interest has been manifested in the case of "Clarke v. London," in which Mr. Commissioner Kerr ruled that a builder was bound to carry

out the verbal orders of a sanitary inspector without reference to the owner, who, in his turn, was liable for the cost of the work he had not ordered. The case has naturally been commented upon by our leading medical and architectural journals, and the response to the invitation in my letter has been such that legal advice has been obtained, with results which will shortly be laid before a meeting of those interested. I shall be pleased to forward an invitation to attend the meeting to all who are willing to join in a protest against such an arbitrary administration of the Public Health Acts. We all know that too much attention cannot be given to sanitation—in other words, to cleanliness; but the laws of health as administered by a local sanitary authority, even with the assistance of a department of the Imperial Government, are not always interpreted with that correctness that is necessary to ensure sanitary conditions, and there is a growing opinion that it is possible a careful inquiry into facts connected with the administration of the Public Health Acts may lead to the conclusion that the powers of our local sanitary authorities are greater than is desirable in the interest of the health of the community, even when legitimately exercised. However opinion may differ as to this, it surely must be admitted by all those who give the matter the least consideration, that, if we tolerate the transfer of these powers to a salaried inspector, the privacy of the Englishman's home will soon become a thing of the past. Those who are prepared to accept such a state of things will perhaps not feel it to be any injustice to be made liable for any orders the sanitary inspector may presume to give. I am persuaded that, whatever may be the legal powers of sanitary inspectors, experience has already shown that in some respects the Public Health Acts need amendment, and proposals to that end will be submitted to the coming meeting to consider Mr. Commissioner Kerr's strange ruling in the case of "Clarke v. London."

A DRINKING fountain erected in the wall of Drury Lane Theatre, on the north side of the main entrance, as a memorial to the late Sir Augustus Harris, was recently unveiled. The fountain, which was designed by Mr. S. R. J. Smith, is built of granite and Mansfield stone, and has bronze enrichments. The base is of polished Norwegian granite and Sicilian marble. The water is delivered from a lion's head, and above the basin is a panel illustrative of dramatic Art, having figures carrying masks. Above this panel rises a classic pediment supported by two polished granite columns having drums at the base and musical instruments in bronze carved on them. Under the pediment, which has tragedy and comedy masks, and a central lyre, is a niche containing a bust of the late Sir Augustus Harris, beautifully modelled and worked in bronze by Mr. T. Brock, R.A., and having the name "Augustus Harris" inscribed underneath on a bronze panel.

MR. MALCOLM PATERSON, M.I.C.E., has prepared a report on the state of the service tank on Red Hill, Castleford, Yorks, which is almost without a precedent in this country. A huge fissure extends across the entire surface of the bottom, 2ft. to 5ft. in width, and about 28ft. deep. This was laid bare some months ago, after the sudden disappearance of the contents of the tank, when the concrete bottom was partly removed. The reservoir site is on the Permian formation, the strata consisting of magnesian limestone, lying in a compact sand-bed almost indurated to rock. This rock yields the best moulder's sand, and has been excavated by mining for many generations in long galleries with supports and adit entrances. The workings extend for miles, and have been proved to approach within a few feet of the reservoir, and probably extend below it on the north side. By exposure to air and the infiltration of water they have gradually crumbled and fissured, causing leakages from the tank, which in their turn have accelerated the waste and the subsidence, and have caused the ruin of the tank. An inspection of these workings was necessary, though

attended by danger from loose rock in the roof. In Mr. Paterson's report a previous proposal to buttress the north side by a retaining wall, arched on plan, is set aside as a futile and hazardous operation, instead of this, he proposes to construct a new reservoir, holding 1,250,000 gallons, on a new site on adjacent ground to the west of the present tank which appears to be the only suitable site not honey-combed by the sand-workings; but even here he considers that five or six borings, not less than 50ft. deep, indispensable to prove the ground. The cost of the new reservoir, if open, is estimated at £3250, or if covered, at £4700.

MESSRS. TOOTH, in the Haymarket, keep to their accustomed lines, and their winter exhibition is one of cabinet and other works by such English painters as Messrs. Henry Woods, Leader, Seymour Lucas, David Farquharson, Blair Leighton, and James Orrock; and by MM. Munkacsy, Domingo, Auguste Bonheur, Jacquet, Deutsch, &c. Many of these are, of course, extremely accomplished. Nothing could, in its way, be better than Mr. Seymour Lucas's seventeenth century figure, "Thinking it Out"—very brilliantly painted, in his buff jerkin and scarlet cloak; or than the little Venetian scenes of Mr. Woods and Mr. Logsdail; or than the beautiful early work of the lamented Henry Moore, "An Estuary," with its transparent water and threatening sky. Of the foreign pictures, a conspicuous place is claimed by Mme. Diéterlé (Van Marcke's daughter) for her "Cattle on the Coast"—very clever and competent, but hardly interesting because representing rather what the artist has been taught than what she has personally observed and felt. A better painter is the neglected Auguste Bonheur, whose cows are really almost as brilliant as Troyon's, though he has a much duller feeling for landscape. The work of Professor Scheurenberg is new to England; though the painter has a high reputation in Berlin; his picture of "The Sea's Delight" is very English in technique, and is not without charm.

THE decision of the President of the Royal Academy and the Director of the Guildhall Art Gallery as to the Seller pictures will be awaited with considerable interest. There is a natural inclination to criticise generously a generous gift. But we are, even already, suffering from the presence in several of our collections of specimens of Art of which the country has ceased to be proud. In France there are facilities for relegating to local museums canvases which on appeal are not considered to merit their original selection or acceptance. The birthplace of the painter is considered in these ultimate disposals, or, if the subject is "historical," the incident recorded helps to decide the final locality of the picture. We have not these opportunities, and therefore we should look more jealously at what we accept. If this be true of London generally, of the National Gallery or the Tate Gallery, it is specially true where wall space is so limited and so precious as in a gallery in the heart of the city of London.

THE royal parish church of St. Martin's, Trafalgar Square, has just been formally opened after elaborate redecoration. Electric light has been introduced, the interior has been repainted and gilded, the old oak pews are less obtrusive than they were, and in a hundred ways the church presents a more attractive appearance than it ever did before. The scheme of decoration has cost between £3000 and £4000.

A LARGE amount of damage has been done during the past few days in the Quarry Bank district. Gas and water mains are being frequently broken, and gangs of men are engaged continually in restoring the supply. Houses are being shattered which at first escaped, and part of High Street, Quarry Bank, shows now the same amount of wreckage as lateral streets have heretofore had a monopoly of. Some people continue to use part of their ruined premises, though at peril to life and limb.

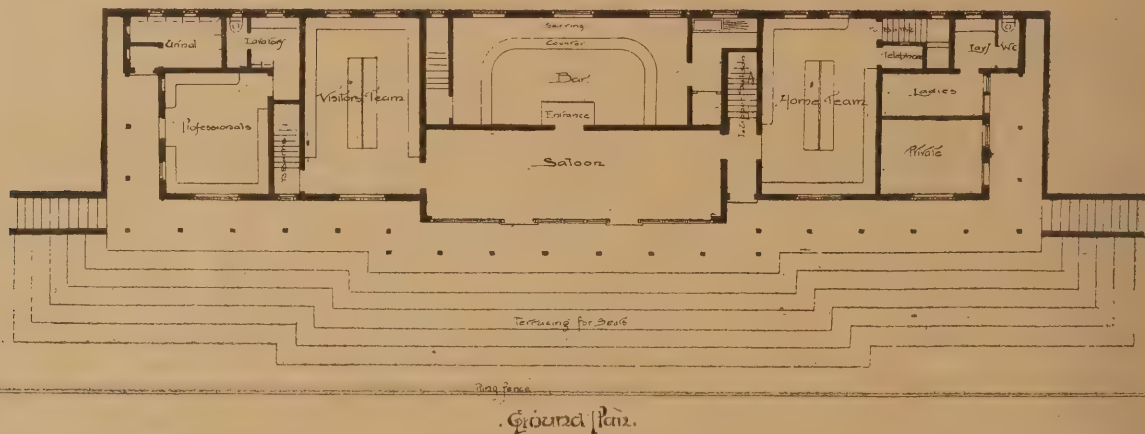

THE most magnificent hotel in the world has, within the past few days, been opened in New York. This is the Astoria, which for the past two years has been in the course of construction on the south-west corner of Fifth Avenue and Thirty-fourth Street. It is seventeen stories high, and stands on a plot of ground 125ft. by 400ft. The approach to the main entrance is by a drive-way through a covered courtyard walled with plate glass and supported by pillars of Siena marble, while there are a dozen other entrances. The corridor on which the great doors open is 400ft. long, and is finished in semi-Empire style, having walls of Siena marble. The ball-room is 100ft. square, and has two galleries 40ft. from the floor above, which is a beautiful frescoed dome ceiling. The galleries are divided into forty-three boxes, which are semi-circular in front, while on the north and south ends are balconies. The Astor gallery on the first floor is one of the great apartments of the house, a room 102ft. long by 40ft. broad, which is sumptuously decorated. Among the other rooms are the "green room," which many of those who have seen it consider the most beautiful room in the hotel; the "myrtle room," so called from its decorations, which is intended to be used for weddings, and the "Colonial room"; while there are billiard rooms for ladies, and drawing-rooms especially appropriated for their use. A decidedly novel feature is the arrangement of the ground floor, where, by the use of glass panels, an uninterrupted view of the whole floor can be

himself—here is a task for all that a man has of fortitude and delicacy."

At last week's meeting of the London County Council, a report of the Fire Brigade Committee gave rise to a discussion of considerable interest in its bearing upon the work and accounts of the Works Department. The committee had advertised for tenders for the work of altering and enlarging two fire stations in consequence of the manager of the Works Department having rejected the work on the ground that the architect's estimate was too low. Four tenders had been sent in, the lowest of which was nearly £800 in excess of the architect's estimate. After due consideration, the committee had decided not to recommend the acceptance of any of the tenders, but to modify the plans.—Mr. McKinnon Wood moved an amendment to refer the report back for fuller information, which should include the causes that had resulted in the lowest tender exceeding the estimate by so large a sum. He said complaint had been made against the Works Committee; that in the past it had quarrelled with the estimates. The present case, he thought, to some extent justified its action. The manager in this instance said the estimate was too low, and now the contractors said the same.—Mr. E. White said his complaint against the Works Committee had been that it had accepted work at too low a price, and consequently lost money. He also complained that contractors were bound by vexatious conditions, from

which it was an essential feature in church internal arrangement that the altar should be placed in such a position that all the worshippers could have an opportunity of seeing it. That cardinal point had been embodied in the plan he proposed. It was in fact the only plan that would carry out the suggestion. The only objection raised some time ago was that the altar should be taken from its present position, and placed in the west end of the church. The Bishop said that the west end position for the altar was only an Anglican or English speciality. The Church of St. Werburgh's, at Derby, disregarded orientation, and they could do so at Heage. There was no radical objection to placing the altar at the west end. He next went on to refer to the alternative plan, which retained the altar in its present position, and the pulpit was placed at an angle in the edifice. Instead of all the worshippers being able to see it, some would be placed quite out of sight of the altar. This was a great objection to the plan, that had come as a sort of inspiration.—The plan recommended by the vicar was adopted.

MR. STANLEY LITTLE, in the course of a recent article, disputes the assumption too hastily made that, compared with the Italian, Flemish, Spanish, and Early English schools, modern painters have no individuality, although taking the whole body of living painters and contrasting them with the Italians of the sixteenth or the Dutch of the

HULL CRICKET CLUB PAVILION. BY PERCY T. RUNTON.

obtained. The garden court is designed after the Italian Renaissance in richly-carved stone, and runs up through two stories, so that two galleries are admitted into it. By breaking down the wall between the next most liberally-appointed hotel in New York, the Waldorf, which adjoins it, and replacing the masonry with plate-glass doors, a view has been made through the two hotels extending from Thirty-fourth Street to Thirty-third Street. The Astoria belongs to Mr. John Jacob Astor.

SAN FRANCISCO is the first city in the United States to unveil a memorial to Robert Louis Stevenson. It is a fountain, and stands in the old Plaza, an open space which, in the palmy days of gold fever, used to be the nucleus of the bustling life of that pioneer community. The fountain is of plain but tasteful design. The main granite shaft is 13ft. high, and on top, executed in bronze, is a sixteenth century ship under full sail, emblematical of Stevenson's wandering and romantic tastes. The inscription, incised in plain lettering on the granite, consists of a passage from the author's Christmas sermon as follows:—"To be honest, to be kind, to earn a little and spend a little less; to make, upon the whole, a family happier by his presence; to renounce when that shall be necessary, and not be embittered; to keep a few friends, but these without capitulation—above all, on the same grim conditions, to keep friends with

which the Works Committee was free. The reason that the contractors were so high was that the contractors declined to place themselves under these conditions unless they had some security from monetary loss.—Mr. J. Burns, M. P., said the reason the Works Committee took work at low prices was that it was urged—he might almost say forced—to do so by Mr. White and his Moderate friends. In this case the Works Department offered to undertake the work for £4800.—In the result the amendment was agreed to.—On the motion of Mr. Goulding, M.P., the Council expressed the opinion that it was desirable that the embankment on the Thames should be continued from the Victoria Tower Garden to Lambeth Bridge, and referred it to the Improvements Committee to report generally upon the subject, such report also to deal with the question of widening Millbank Street, and the utilisation of any surplus land which might remain after the carrying out of the improvement.

SOME difficulty exists owing to there being two schemes for the restoration of Heage Church, and a vestry meeting was recently held to consider the subject. The vicar said the plan of the Bishop ought to be accepted, because it was the plan of the head of the diocese, and entitled to very great respect. Everyone he had spoken to about the plan of the Bishop approved of it. All church archi-

seventeenth century, he allows that the moderns are at a disadvantage. When posterity comes to sum up the Art achievement of the Victorian era it will, he holds, be found that a rich legacy has been left, which coming generations will not allow to die.

THE third of the twenty-four decorative panels with which it is intended to adorn the walls of the ambulatory of the Royal Exchange was unveiled within the past few days. The painting is by Mr. J. S. Solomon, A.R.A., and represents the visit paid by Charles I. to the Guildhall to demand the giving up of the five members of Parliament whose arrest was resisted by the House of Commons.

THE ancient hostelry of "Ye Olde Robin Hood," Derby, has recently been thoroughly restored. It is one of the few remaining old inns recalling the days of our fathers, having a spacious courtyard with stabling around, and where on market days may still be seen rubicund specimens of the British farmer. The bar has been entirely reconstructed, the chief material being bamboo, the effect being novel and pleasing. Tradition says this old house was a favourite haunt of the famous freebooter whose name it bears. The contractor for the alterations was Mr. George Durant, Grange Street, Derby.

SOME NEW BUILDING MATERIALS*

By H. D. SEARLES-WOOD, F.R.I.B.A.

THE two materials that I propose to deal with are asbestic and petrifite. I do not pretend to have any experience in the use of either, but they having come under my notice, and striking me as of very great importance, I thought that the members of this Association might like to have their attention called to them. Asbestic comes to this country from Lower Canada, and is a name given to a by-product from the manufacture of asbestos from serpentine. After the fine white fibrous asbestos has been extracted by machinery, this sand is left, and it is the various uses to which this can be put; that I propose to call your attention. Large quantities of this material have recently been used in the United States and Canada in the form of plaster. It is claimed for plaster made with ordinary lime and asbestic (the proportion recommended being 3cwt. of lime to 1 ton of asbestic) that it is absolutely fireproof, and being fibrous and possessing very great elasticity, there is no cracking, chipping, or crumbling away, and nails driven into it enter in the same way as into a pine board, and can be easily withdrawn. This plaster is also a perfect non-conductor of heat, and rooms plastered with this substance keep an even temperature much longer than rooms plastered with other materials. It is stated that this plaster, being a perfect non-conductor of sound, has a curious effect on the room or hall where it is used, making them much easier for singing or speaking in.

FOR THE PROTECTION OF METALS,

this substance has a great future. An elaborate series of experiments were carried out by General Povey Smith, when he found that asbestic not only protected the metal against fire, but at the same time preserved it from any corrosion. The covering properties of the asbestic plaster are about 40 per cent. more than those of ordinary plaster, and it is 40 per cent. lighter to handle; the mixing and application are so much easier that there is a saving of 25 per cent. in actual labour. The directions for use are given as under:—For rough coat: Slack about 3cwt. of lime, and while liquid run it through a sieve into a box large enough to hold one ton of asbestic. Mix thoroughly, adding the requisite amount of water. After the lime and asbestic are thoroughly mixed, the plaster should be allowed to stand at least twenty-four hours before being used. For finishing coat: Mix two parts of lime to one of asbestic finish, and gauge with plaster of Paris. No hair or sand is required. The price of the asbestic, per ton of 2,240lbs., is £3; asbestic finish, £5. The sole agents for London are Messrs. Witty and Wyatt, of 88, Leadenhall Street, E.C., where numerous samples can be seen. The foregoing information I have obtained from the trade circular. The plaster takes about three weeks in setting to get thoroughly hard, and it gradually toughens after that time. The asbestic is now being made up in slabs about $\frac{1}{2}$ in. thick; these can be

WORKED AS EASILY AS WOOD,

and as non-conductors of heat and cold they can be utilised for walls, ceilings, cornices, mosaics, &c., and can be used out of doors and coloured as required. In hot climates it will resist the attacks of the termite, or white ant. A bungalow constructed with an outer and inner skin of this material, and a confined air space between, would have a low temperature in the hottest weather. It can be moulded to any shape and fixed in position by nails, screws, or cement. This material is far more suitable for buildings in new countries, such as Africa or West Australia, than corrugated iron or Hessian (that is, canvas and framing that does duty for walling in many of the new townships in those countries). A friend of mine, who has just returned from West Australia, particularly complained of the discomfort of the Hessian built hotels. Picture to yourselves an hotel constructed entirely of

canvas, in which there were five bars, and all of them filled with miners whose panacea for every ill is whisky. The non-conducting property of asbestic plaster would in this building be of great value. In America and Canada asbestic roofing is largely used; it forms a light roofing material that is absolutely incombustible, and, being a non-conductor, keeps the building of an even temperature. For hot countries glazed asbestic tiles are being made for roofing purposes. In the manufacture of paper asbestic is being largely used. Paper 130in. in width is being produced in one factory for building purposes. Asbestic has been recently selected by the London County Council as one of the fireproof materials that may be used in the alterations at Olympia. Talking over the subject of this paper with Mr. Drew, when we were at Furness Abbey, I asked him what new material in his opinion was most wanted. He replied:

"AN ARTIFICIAL SLATE."

By the kindness of the proprietors of the two materials I am describing, I have made some artificial slates which I think will meet this want. The samples were only made yesterday, and so are not yet fit for experiments, and the surface is smoother than I intended; but I think that they show that a good roof covering can be made in this way. They would be light, non-combustible, and non-conducting. These samples are self-coloured, and are a dark grey, but they could be made to any shade of colour.—Petrifite is a white cement which appears to have the power of binding together almost any material that can be thought of. The principle of the invention was discovered in 1891, but it was not until some years later that a cheap and practical method of making petrifite was worked out and patented, and even now it is not practically on the market, though I am informed that it is hoped it may be by the 15th of this month. During the lapse of time from its discovery a large series of exhaustive and interesting experiments have been made, and some wonderful results obtained. Messrs. David Kirkaldy and Son have reported on the following experiments:

Result.

25 per cent. Portland cement and clean pit mud, petrifite and ordinary sea sand.	Petrifite eleven times the strength.
Petrifite and common earth.	Nearly four times the strength.
Natural Bath stone: 10 per cent. petrifite and ordinary sea sand.	Nearly twice as strong.
Natural Portland stone: 25 per cent. petrifite and ordinary sea sand.	Stronger when only thirty days old.
Marble Carrara blocks: 50 per cent. dust from the same with petrifite.	8 per cent. stronger.
Tensile strength: 25 per cent. Portland cement and clean pit mud. 25 per cent. petrifite and clean pit mud.	Over five times as strong.
Tensile strength: 25 per cent. petrifite, sea mud, and powdered chalk.	Over seven times as strong.
Porosity: 25 per cent. Portland cement and clean pit mud. 25 per cent. petrifite cement and clean sea sand.	Nine times less porous.

In a further report made by Messrs. Kirkaldy in May, 1897, as to the effect of immersion in water, it was found to reduce the ordinary petrifite 25 per cent. in strength, as against 10 per cent. in natural Portland stone and 20 per cent. natural Bath stone, but in samples made with hydraulic petrifite, which is ordinary petrifite mixed with from 5 to 10 per cent. of inexpensive materials, the diminution in strength is slight. As regards hardness of surface and hardness internally, there is hardly any appreciable difference between 2 to 1 Portland and 6 to 1 or 9 to 1 petrifite. A backing of 6 to 1 petrifite, faced with three parts plaster of Paris to one of petrifite, yields a hard and smooth surface very suitable for walls. The tests made to ascertain the relative adherence of petrifite mortar show that

6 of sand to 1 of petrifite adheres as well to the face of rough bricks as good Portland cement mortar mixed 3 to 1. In the case of bricks with rather smooth surfaces, petrifite mortar gave nearly four times the adhesive strength. Petrifite mortar mixed 3 to 1 with smooth bricks had ten times the adhesive strength of the same proportion of Portland cement mortar. Another feature of petrifite is that it adheres to wood. Messrs. Kirkaldy summarise their two reports by stating that petrifite has the following valuable properties:—1. Its combinations have great crushing and tensile strength and adhesive qualities. 2. It will solidify unclean materials, the presence of which, even in small quantities, would be fatal to the setting of Portland and other cements, and bind together into useful blocks many substances which cannot now be utilised. 3. Dirty or unwashed materials can be used, which is not the case with other cements. 4. Its compounds do not sweat or effloresce, thus enabling sea sand to be used. 5. It will adhere perfectly to wood or iron. 6. As ordinarily used it solidifies slowly, so that work need not be hurried; it then dries and

SETS HARD WITH GREAT RAPIDITY.

7. It is so powerful that a much smaller quantity suffices, considerably reducing the cost of freight and transport. 8. After setting has commenced, it can be still used again, as but little deterioration takes place, unlike other cements, when small quantities have to be mixed for immediate use. 9. It does not become inert after exposure to a damp atmosphere. 10. It may be used when quite freshly made, without fear of failure. Messrs. Slunger and Blount's report states that petrifite, when mixed with a suitable aggregate, e.g., sand, expands on setting to about the same small extent as Portland cement. This expansion is not likely to be perceptible in ordinary use. Mr. G. F. Harris, stone and quarry expert, summarises his very interesting report on petrifite sandstone, that the Petrifite Company can deliver a first-class dressed building stone in London at a price under half that of dressed natural building stone, and of a superior quality. As a plaster, petrifite has been reported on by Mr. Marson. Its advantages over Portland cement are that it can be used with sea sand without risk of efflorescence, and the surface is harder and closer than when Thames mud is used. Thus the labour of screening and washing the mud is saved.

PETRIFITE GRIPS THE WHOLE SURFACE,

both smooth and rough places, and being "fatter" than Portland cement, can be laid more easily, and does better. Compared with Keene's cement, it has the advantage of being non-porous, much harder when set, and can be worked much more quickly. If petrifite compounds are painted whilst wet, the paint sinks into the soft material. It takes no longer to dry than ordinary paint put on woodwork. In twenty-four hours a room can be finished and ready for occupation. With colouring matter, petrifite and water is a first-class substitute for ordinary distemper. In moulding, all difficulty of allowance for contraction is avoided, and for making the moulds for casting repeats, petrifite mixed with plaster of Paris or sand is a perfect material. Plaster slabs made of petrifite are much stronger than the ordinary slabs, which are going out of use, as they are not strong enough, although of great convenience. As a cement for iron, an ordinary galvanised iron building can be covered with petrifite plaster, and it will adhere perfectly. Petrifite has one special quality—viz., that the water which is added does not evaporate but enters into a chemical union with the cement. The hardening process takes a very short time; it may be delayed by cold weather, which has a bad effect on all other cements and lime, but the setting is not stopped. A wall coated with petrifite mortar will not crack if done in hot weather. Petrifite cement may be used in any climate and at any season of the year. Used as artificial wood, petrifite mixed with sawdust has the following advantages over ordinary wood. 1. It is one quarter the price of hard wood. 2. It does not expand or contract as natural wood does. 3. It does not split, nor crash, nor warp. 4. Uninflammable. 5. Free

* A paper read before the Architectural Association, on the 5th inst.

from the ravages of white ants. Two tables at the works of the Company, about 12ft. long by 3ft. broad, made of sawdust, are faultless, although they have had rough usage for about three years. This

ARTIFICIAL WOOD

can be cast into any shape or size, and can be worked with the same tools as ordinary wood. It also has the advantage that it can be made in large masses, uniform in quality and strength throughout. For flooring it can be made in an unbroken sheet. It can be made as to be easily sawn at any time, or else it can be made as hard as stone, and can be coloured to any shade. Two artificial stones made of sawdust and petrified have been tested for four years, one as a step outside the main entrance of the Landsberg Factory, and the other as a flag-stone at the entrance gate of a flour mill at Landsberg. Both of these stones show little signs of wear, although they have had very hard usage. At the offices of the Petrified Company, 10, Walbrook, there is a very interesting collection of specimens of a great variety of waste materials, such as road sweepings, ashes, and clinkers from the destructors, made into bricks by the City Commissioners of Sewers by being mixed with 25 per cent of petrified; and some really beautiful slabs made of waste paper pulp, and some slabs of polished plastic made of marble dust, even the sawdust and petrified blocks being capable of taking a polish, the grains of wood being so indurated with the petrified. The sawdust blocks also are practically incombustible. But it is not as an artificial stone, marble, or wood that I bring this under consideration, but as a new material to take up its own ground; and I think that this is the direction in which any discussion might be most usefully turned. Here are two materials of a highly plastic nature, and what is the legitimate treatment for them from an architectural point of view? Petrified can be run, moulded, or worked by a tool; either moulded and built in the walling in blocks, or run and modelled *in situ*. Much remains to be done to develop the proper treatment of cement work. Within its own limits stucco is as legitimate a building material as stone or brick.—The Chairman pointed out that, twenty or thirty years ago, the practice of

IMITATING MARBLES AND BEAUTIFUL WOODS would not have been countenanced by architects. He was afraid we had degenerated somewhat since then. It was, however, of considerable advantage to be able to use these waste products, but the question was, how would architects direct manufacturers to properly use the materials?—Mr. C. H. Brodie, having moved a vote of thanks to Mr. Searles Wood, Mr. Seth-Smith seconded, observing that nothing was more likely to get an architect into difficulties than the use of new and untried materials, hence the necessity for architects to have very open and at the same time conservative minds in regard to such materials.—Mr. E. Howley Sim remarked that when new material was put upon the market, he noticed it was often said to be capable of being used for almost everything. He would like to ask for the weak point about petrified.—Other questions were asked regarding the use of petrified, and Mr. G. F. Seddon, from the firm who manufacture it, explained that the material would not resist strong acid solutions any more than other cements would, but it would bear weak solutions. He did not know of any reason why it should affect the health. The price of cement petrified was 60s. per ton, but it was not yet in the market. The plaster specimen shown was not petrified, but was called petrified, which was supplied at about 50s. per ton. It had been discovered that the action of frost delayed the setting of the material for some time, but it did eventually set, and sooner than Portland or any other kind of cement. As to having a weak point, he did not know of the material having any. With regard to the porosity of the cement, coal brickettes—coal dust and 3 per cent. of petrified—when immersed in water twenty-four hours showed an absorption of 6 per cent. After being immersed forty-eight hours it was $6\frac{1}{2}$ per cent., but at fourteen days there was no great difference.

ARCHITECTURE AS A PROFESSION.

By A PROVINCIAL PRESIDENT.

MR. LESLIE OWER, president of the Dundee Institute of Architecture, in delivering his inaugural address of the present session, offered a few truths for the contemplation of architectural students. There is a healthy tone about Mr. Ower's address. We give the following extracts:—"Opportunities and facilities for the study of your Profession are available now to every one in a far greater degree than ever has been the case in our country. Other nations, France in particular, have encouraged the study of Art and Architecture for generations before we thought the subject worthy of notice, and just as the parochial schools of Scotland, instituted in an age when education was at a very low ebb in all countries, raised the Scot above the average of his fellows and made his foremost position a proverb, so has the Art education of France raised her standard above that of other nations. But we are fast making up for lost time, and it behoves our students to take every advantage of the opportunities put in their way. For let them remember that to whom much is given, of them much shall be required. When such opportunities are available the standard of attainment will ever be on the rise, and to those who do not profit by them, those opportunities can only prove like the talent hid in the napkin, the strongest reason for self-conviction. But let not the student think, on the other hand, that all of Architecture and all necessary for the practise of his Art is to be learned in schools, aye, or even in the office. Nay, the world is the architect's schoolmaster, for he has many to serve, many wants to supply, many crude ideas to reduce to workable shape, many cranks to conquer, many aspirations to sympathise with and strive to give effect to. He has much to learn, for the public expect much from him. Indeed, my experience is that there is almost nothing an architect would not need to know about. He has to be an artist and a thorough business man, two qualities which, like old age and want, are an ill-matched pair. He has to have

A THOROUGH KNOWLEDGE OF ALL THE TRADES,

and to be skilled in construction and in the properties and strengths of the various materials with which he has to deal. Sculpture and painting he must be familiar with, so that he may appeal to them as his good faries for the final touches to grace his finest works. He has to be sympathetic and trustworthy, a gentleman in his feelings and address, judicious as well as firm in many responsible positions. Truly, when we think of all that has to be learned, we are impressed with the truth of the poet's words that 'Art is long and time is fleeting.' But though you have chosen a Profession which entails hard and life-long study, you have also one which has its compensations. You are engaged in an honourable Profession which, worthily pursued, brings pleasure if not profit to its devotee. Especially, would I say, revel in the pleasurable parts of your Profession in your student days, while you have time and opportunity, for as years go on you will ever find increasing demands made upon you, and the drudgery work which has to be done will take a far too large share of attention. Enjoy your sketching tours and visits to old buildings, and to new ones also, for from them much is to be learned. Cultivate the love of the beautiful and seek it in all you see, in the buildings around you, in sculpture and painting, in the universe of God with its many aspects, the fair smiling landscape, the sky studded with stars, or tinted as never man can paint with the glories of the setting sun, the broad majestic sea, powerful in its calm and terrible in its wrath, the awe-inspiring thunderstorm—all these are sources of inspiration and education for your Profession, and in the study of them you will find a great reward; the reward which comes from a well-stored mind, whose memories of pleasant days of study when the heart was young and all the world was fair, will, in the busy days of professional work and

drudgery, waft back the spirit to drink at those fountains of inspiration from which it will rise refreshed to embody their

INFLUENCE IN LIVING ARCHITECTURE.

On our members I would urge the desirability, nay the necessity, of their taking a decided and loyal stand together on many points. Petty jealousies ought not to be allowed to keep the Profession from showing a united front when unreasonable demands are made or unfair conditions laid down, either as regards competitions, fees, or any other question affecting the Profession as a whole, or any individual member of the Institute. In these days of excessive competition, combination is absolutely necessary, as we can see in all trades and professions; and the only way of making our Profession take the position it is entitled to is to be loyal to our common professional interests and to each other. The Institute is much indebted to our Associate members for the kindly interest they take in Architecture, and the support afforded us by the Associates enables us to carry on our work in a more extended way than would otherwise be possible. To them and to the public generally I would quote the words of Ruskin: 'But above all remember that it is chiefly by private, not by public, effort that your city must be adorned. It is only by active and sympathetic attention to the domestic everyday work which is done for each of you that you can educate either yourselves to the feeling or your builders to the doing of what is really great.' It does not fall to the lot of everyone to directly influence the design of a building, but by taking a lively interest in the subject our Associates and the public generally can help to create that standard of taste which will not be satisfied with poor or commonplace design or workmanship. We have only to look at articles of everyday use to see that there has been a great advance in public taste in recent years, and the tendency is still

TO RISE TO GREATER EXCELLENCE.

Wall-papers, for instance, are marvels of good taste combined with cheapness. Children's picture-books are works of Art, and must have an educative influence on the coming generations. Tiles, furniture, and textile fabrics now adorn the homes of the many instead of being procurable only by the wealthy. In this advance in public taste, and the bringing of beauty and refinement into the life and soul of the people, I think there is great ground for satisfaction. Art has never had, and never can have, such a potent influence over the heart of man as to guide him to the right conception of spiritual truth, as some of its over-zealous advocates would almost try to make us believe. But it has a great and ennobling influence, and leads men's minds to the contemplation of the source of all that is beautiful and true, and those who encourage it in any way, whether in the common articles of every-day life, in painting, in sculpture, or in building, may rest assured that they are at least helping forward to some degree the building of that spiritual temple 'whose walls shall be Salvation, and whose gates Praise.'

The London County Council has lately been making inquiries with a view to ascertain the precise value of the chalybeate springs on Hampstead Heath, and as a result has placed a new fountain on the West Heath, close to the Leg of Mutton Pond.

A most beautiful piece of modern sculpture has just been unveiled in the Church of St. Cybi, at Holyhead. It is the altar tomb in memory of the late Hon. Wm. Owen Stanley, upon which Mr. Hamo Thornycroft, R.A., has been engaged for some years.

READY-SQUARED granite blocks are procurable at a quarry in Newfoundland, according to a paper read recently by Mr. Outerbridge before the Franklin Institute. The masses are of various sizes, and are so geometrically formed by Nature that they are to be obtained in abundance, quite ready for the builder's use. There are buildings in St. John's constructed entirely of these granite blocks, on which no artificial dressing has been necessary.

Professional Items.

BIRMINGHAM.—The curious and (outside) infinitely ugly old building known as St. Mary's Church, Whittall Street, Birmingham, in the heart of what was once the "gun quarter," and is now more or less a nondescript district, has just left the hands of the restorers. St. Mary's was one of the three city churches originally scheduled in the Churches Bill, but was rescued from the hands of the despoilers. Messrs. Bateman and Bateman are the architects for the restoration, Messrs. Horton and Son the decorators, and Messrs. Jeffery the builders. The heavy drooping ceiling is now a handsome dome, painted in panels in more or less classic and conventional designs in three primary colours and soft-graded tones. The walls are of tender apple-green hue to the level of the old galleries, and above that in cream colour, and the windows are framed in ornament in blue, green, and red, in designs which harmonise thoroughly with the ceiling. The pillars which now carry the roof direct are more massive in proportion than the old divided supports. The groundwork is a creamy white, with flutings and bands of maroon red. Above the cornice of the ceiling is a broad band of floral ornament in two shades of red, and from this band to the open work centre of the apex the angles are marked by ribs of leaf ornament in indigo blue and sage green; the triangular spaces thus formed are filled in with larger planes of stencilled ornament, suggesting the Italian detail of the fifteenth century—the architect has, in his designs, availed himself of several drawings made while travelling in Italy a few years ago. This is mainly in a rich chrome yellow, with shields of red in the centres. Nothing has been attempted in the small chancel, though the removal of the gallery has set free on either side the spaces which were formerly occupied by staircases.

The new city meat market and slaughterhouses, in Bradford Street, have already attracted considerable attention in the country. The London County Council having delegated to the Public Health Committee the question of considering the desirability of providing public slaughterhouses for the metropolis, in order to obtain information on the subject, sent a deputation to Birmingham to inspect the buildings. The visitors (including Mr. T. Blashill, L.C.C. architect) were shown over the buildings, and the committee and officials explained to them the various details of the different departments. The slaughterhouses and the mechanical arrangements for the transport of the carcasses in the wholesale market were particularly inspected, and the deputation congratulated the committee and the city upon the possession of markets which were perfect in their appointments and general arrangements.

CROY.—Croy Free Church stands on a commanding site, and is within a stone-throw of the manse. It is a plain, substantial building, and has been in existence since 1852. Some ten months ago it was decided, on account of the dilapidated condition of the edifice and uncomfortable internal arrangements, to entirely renovate and remodel the structure. Briefly, the whole of the old galleries have been removed and a curved end gallery adapted instead, the body of the church and gallery being fitted up with wide, comfortable pitch pine seating. Finished in pitch pine and cypress wood, of circular form, the pulpit is very handsomely designed, and presents a pleasing appearance. The choir accommodation is on a raised platform, which is to be fitted up with chairs. The walls and ceiling of the building are pointed in soft rich colours, while all the woodwork throughout is stained and varnished. An addition has been made at the back of the church, and this is utilised as a staircase, hall, and entrance lobby for access to the gallery.

DARTFORD.—Plans for proposed improvements to the Asylum buildings at Stone, near

Dartford, at a cost of £46,770, have recently been adopted. Tenders for the work were invited from eighteen well-known firms of builders. Three declined, and the remaining fifteen sent in tenders ranging from £59,000 to upwards of £80,000. Those tenders were for the erection of the fabric of the building only, and did not include any machinery, internal fittings, or furnishing. The visiting justices consider that a further sum of £10,000 beyond the amount of the lowest tender will have to be expended on those items, and on certain works which have recently become necessary. A very considerable increase had taken place in the price of builders' materials, more particularly in the price of bricks, and owing to the disturbed state of the engineering trade difficulties had been experienced on the part of the firms tendering in obtaining quotations for the ironwork required. Those causes had largely tended to increase the estimate originally formed. As it was of the utmost importance that the works should be at once proceeded with, the visiting justices are seeking to obtain an increase of the grant from the Corporation to £70,000 instead of £46,770.

DUNDEE.—A sub-committee of the Dundee Town Council recently considered the question of exits from public works in case of fire. Two sub-sections of Section 7 of the Factory and Workshop Act, 1891, specially engaged attention. Under the first it is conditioned that in the case of every factory erected after 1892, in which more than forty persons are employed, it will be necessary to procure a certificate from the sanitary authority that the stories above the ground are provided with such means of escape, in case of fire, as can reasonably be required in the circumstances. The Committee resolved to recommend that the Burgh Engineer be instructed to report to the Sanitary Committee on all factories and workshops which should be certified in terms of the statute. The other sub-section (No. 2) stipulates that with respect to all factories not affected by the foregoing provisions of the Act, and in which more than forty persons are employed, the sanitary authority shall see that proper means of exit are furnished, and in the case of inadequate provision serve notices on the owner to have exits provided. The Committee recommended that the sanitary inspector be instructed to give effect to the Act. The Works and Sanitary Committees will consider these recommendations in January.

FELIXSTOWE.—At a meeting of the Felixstowe Urban District Council, Mr. Thos. Ward brought forward a motion in reference to modifying the specification for street paving. It was to the effect that instead of 10in. of material there should only be 7in., consisting of 3in. of brick, 1in. of chalk, and 3in. of granite. He referred to the complaints which had been made about the expense of the present specification, and urged that the modification he had proposed would answer every purpose, and be satisfactory to the majority of the ratepayers. A good deal of discussion ensued on the point, and eventually 8in. was substituted for 7in., and the proposition agreed to.

FELLING (DURHAM).—The stone-laying ceremony in connection with the new Sunday schools of the Wesleyan Chapel, Felling, took place recently. The site of the new building is at Holly Hill, and is sufficiently large to allow of the erection of a chapel at some future date. The building is of local stone. A central hall or schoolroom, 57ft. by 30ft., forms the main department, having at the sides of the same entrance halls, book stores, cloakrooms. At the west end of the schoolroom, and running along the gable of same, is placed a corridor, out of which opens back entrance, ladies' meeting-room, and kitchen. Adjoining these rooms and directly connected to schoolroom and corridor is an infants' room and vestry, which has a separate external entrance and lavatory accommodation. Special attention has been devoted to the ventilation and heating, the latter being by means of hot

water coils, supplied from a heating apparatus in the heating cellar under one of the larger classrooms. The work is being carried on from the designs and under the supervision of Mr. James W. Frazer, architect, Newcastle, the contractor being Mr. Robert Davidson, of Davidson Terrace, Felling.

GATESHEAD.—The foundation stone of St. Chad's Parish Hall and schools, Westminster Street, Saltwell Lane, Gateshead, was laid recently. The building is designed in the domestic Gothic style of Architecture, the elevations being carried out in brick with stone dressings. The main front elevation is faced with pressed Comondale bricks, and other elevations are faced with Birtley bricks. The large hall, which is entered by a porch from Westminster Street, is lined with brick, a dado of cream-tinted glazed brick running round the hall, a sanctuary being formed at the south end having a movable partition to screen it when not in use for services. The hall has a high open-timbered roof. The school has four class-rooms, boiler-house, yard, and offices. The architect is Mr. Eugene E. Clephan, of St. Nicholas' Chambers, Newcastle, and the contractor Mr. Isaac Bewley, Dunston.

HERNE BAY.—The foundation-stone of the Passmore Edwards Convalescent Home, to be erected in the neighbourhood of Herne Bay, has just been laid by the founder. An excellent site for the Home has been purchased, and the cost of erection of the building, as also that of fencing the land, estimated at £6000, has been undertaken by Mr. Passmore Edwards. The building is to be three stories in height, and will contain accommodation for some fifty patients. Spacious gardens are also to be provided. It has been sought in the elevation of the building, no less than in the grouping of the rooms, to avoid the idea of an "institution," as opposed to a "home."

HOOTON PAGNALL.—A lych gate has just been erected at Hooton Pagnall, under the careful direction of Mr. E. Bernard Wilson, architect to the Frickley estate. It is massively constructed of well-seasoned English oak resting upon dwarf walls of local masonry, and covered in by red tiles. It is designed in the Fifteenth Century or Perpendicular style of Gothic Architecture, and is thus, in conception and general grouping, admirably adapted to the immediate surroundings. The ridge is surmounted by a metal cross. It is worthy of remark that in the construction and putting together of the bulky timbers no sort of metal screw or nail is used, the whole being held *in situ* by oaken pins. As an example of modern constructional carpentry the work is of a very excellent class, and distinctly that of specialists in the higher walks of wood Architecture. The floor beneath the lych gate is flagged with stone. The gate has been made by Messrs. Hems and Sons, of Exeter.

IPSWICH.—The parish church of Playford, near Ipswich, was recently re-opened by the Bishop of Norwich. The old roof of the church was coiled over, and whitewashed below, after the fashion commonly in vogue many years ago, and the rafters had become rotten and worm-eaten. It was absolutely necessary, therefore, that something should be done, and the plain open roof of oak, which has now been substituted, is in every way a great improvement. From plans sketched out by the churchwarden, the work has been executed by Mr. A. Kersey, of Great Bealings. New gable crosses have been placed in the nave, at the east and west end. A shaft of one of the old crosses, which is believed to be as old, if not older than the edifice itself, has been carefully preserved. With the completion of this project, this interesting and picturesquely-situated church is very nearly brought into a perfect state of repair.

LONGFORD (DERBYSHIRE).—In the Longford parish churchyard in mediæval days, a very fine old cross stood towards the south-east of the sacred fane, and indeed the steps and base

stones, as well as half of the splendid monolith shaft, exist till this day. All above met the common fate from iconoclastic hands some two or three hundred years ago, and in its insulted ruined shade the shamefully treated emblem of Christianity has remained until now. The work of a generous renovation being decided upon, Messrs Naylor and Sale, architects, Iron Gate, Derby, were consulted. After much archaeological research, they were enabled to find out pretty nearly what the original cross was like. It is satisfactory, therefore, to know that in its now completed state the whole is practically a *fac simile* of what it originally was. The renovation has been most conservatively carried out—not a bit of the existing old stonework, not even, in fact, a green-grown lichen! has been disturbed; but the new work has been strongly carried right up, straight off the fracture on the old shaft. It has been worked in one piece of Hollington stone (a fine block, over 7ft. high). The lower part is octagonal, carrying gracefully the line and battering of the ancient column. Above is a foliated cross, the final termination and finish of the arms being crisply carved with conventional foliage of fifteenth century type. Towards worshippers, as they leave the south-west porch of the old church, is a well modelled and sculptured figure of the crucified Christ, nailed to the tree, crowned with thorns, with a nimbus behind the sacred head. Above is the *tulle*, upon which are inscribed the four initial letters, "I.N.E.I." On the reverse side, i.e., facing east, and looking towards those who wend their way from that direction to the church, is a finely conceived statue of St. Chad. Most of our old English saints are known by their particular emblems, but St. Chad is never so represented; and so the sculptor has judiciously shown him simply arrayed in full canonicals, mitred, and holding his crosier lightly between his arms, whilst he seems earnestly directing those around him to a study of Holy Writ, an open copy of which he holds in his hands. The saint stands secure enough upon an effectively carved corbel, and has a nimbus behind his head, and is passingly protected from the weather by a cusped canopy projecting pleasantly, with ogee outline ("Curved is the line of beauty, straight is the line of duty"). This interesting restoration at Longford parish has been carried out under the architect's immediate directions by Messrs. Hems and Sons, of Exeter.

PETERHEAD.—At the monthly meeting of the Peterhead Harbour trustees, Mr. Barron, engineer, under remit, reported as to the suitability of various sites suggested for a fish market. In selecting a suitable site for a market, he said there should be kept in view the essential requirements and conditions of accessibility to and from the sea, deep water and shelter, room for extension, large floor space, and connection with railway system. The ground available for a market and having all these requirements was unfortunately very limited. In considering and fixing upon a suitable site, it should be kept in view that the harbour possesses both a north and a south entrance, one of which was almost always available, irrespective of the state of the sea or weather. It would therefore be desirable to consider at both harbours, although he believed that experience pointed to the south harbour as the most suitable place. The various sites appearing more or less suitable were referred to the Committee for consideration.

Notice to London and Provincial Readers.

The Editor of the "Builders' Journal" will at all times be pleased to receive and consider articles of a professional or technical character suitable for these pages. Papers read before Architectural bodies will also, if forwarded, receive careful consideration.

THE WINTER SESSION.

WOMEN AS SANITARY INSPECTORS.

THE question whether women sanitary inspectors should be admitted to the membership of the Sanitary Inspectors' Association, excited much difference of opinion at the inaugural meeting of the Association, over which Mr. Dee, Westminster, presided. Two ladies, Miss Alice Tattersal, and Miss Emma Coppock, who are employed as sanitary inspectors by the Corporation of Manchester, were proposed as members, and, while their nomination was warmly supported by one section of those present, there was another, equally energetic, and more numerous, who maintained that women ought to be excluded from the Association. Several members protested against the incursion of women into callings for which they were unsuited. In reply, it was stated that with regard to sanitary inspection, the work in certain circumstances could better be performed by women than by men. On a division being taken, the proposal that women should be elected to the membership of the Association was rejected by forty-nine to thirty-nine votes. Subsequently, when the election of new members was proceeding, attention was drawn to the fact that all candidates gave their full Christian name, with one exception, in which case the surname was preceded simply by the letter "A." The initial, it transpired, represented "Annie," and several members protested against what they called an attempt to elect a female member by a trick. The candidate in question was thereupon struck off the list.

GREEK ART.

At the first general meeting of the Hellenic Society, held at 22, Albemarle Street, at which the chair was taken by Mr. Talfourd Ely, Professor Ernest Gardener read a paper on a Greek vase in the museum at Harrow School. This vase, he said, of which the subject was Caeneus and the Centaurs, was the gem of the collection which was presented to the school museum by Sir Gardner Wilkinson. It had recently been admirably cleaned, in common with others, by Mr. Sharp of the British Museum, and we might now be tolerably sure that all that was left was the work of the original artist. The figures painted on the vase were those of Caeneus, who had wounded the central Centaur. The latter was about to hurl a huge stone on the hero. Two other Centaurs on either side held pine branches with which they were about to strike Caeneus. The drawing was wonderfully vigorous, and belonged, undoubtedly, to the best period, and no hesitation could be felt in assigning the vase to the age of Euphronius or Onesimus. The fishy eye and the fierce aspect of the middle Centaur, and the subtle gradations of expression from the more or less savage appearance of the two Centaurs on the sides to the delicate features of Caeneus, were efforts of marvellous skill, and the bold invention exhibited in the drawing was probably due to Euphronius himself. The legend of Caeneus was one of the most interesting in Greek mythology. It was found in various forms from Homer downwards, and the beginning of it was to be traced to the battle with the Centaurs at the wedding of Peirithoos.

A FEAT IN CONSTRUCTION.

At the ordinary meeting of the Institution of Civil Engineers last week, Sir John Wolfe Barry, K.C.B., F.R.S., the President, in the chair, four papers, by Sir E. Leader Williams, M.Inst.C.E., Mr. Whately Eliot, M.Inst.C.E., and Mr. W. O. E. Meade-King, M.Inst.C.E., dealing with the construction and working of the Manchester Ship Canal, were read. The first paper gave an historical account of the undertaking, with a general description of its construction and equipment. The Ship Canal Bill was obtained in 1885, the plan being modified to meet the strong opposition to training walls in the Mersey, by substituting a semi-tidal canal along the Cheshire side of the estuary, commencing at Eastham, about six miles above Liverpool. The length of the

canal to its termination is 35½ miles. The excavation had amounted to about fifty-four million cubic yards, including twelve million cubic yards of sandstone rock. The expenditure of the Company to the 1st January, 1897, had been £15,168,795 15s. 11d.; and the traffic had increased from 925,659 tons in 1894 to 1,826,237 tons in 1896. The construction of the Eastham and Runcorn divisions of the canal, when it was found necessary to take the line across the bays by embankments between the canal and the estuary, was described in succeeding papers. Exceptional difficulties had been encountered with portions of the Pool Hall Bay embankment. An account was also given of the use of the high-pressure water-jet in pile-driving through the sand, which had been adopted with success at Ellesmere Port Bay. The last paper presented a description of the Irlam Division, where the nature of the work was rendered difficult by the frequent crossings of the Rivers Mersey and Irwell.

"EIGHTEENTH CENTURY ARCHITECTURE."

At the monthly meeting of the Sheffield Society of Architects and Surveyors, Mr. J. A. Gotch, F.S.A., F.R.I.B.A., delivered his lecture on "Eighteenth Century Architecture," which was amply illustrated by numerous photographs of buildings, with plans and details, and lime-light lantern slides. The lecturer said the view of Architecture taken in the eighteenth century was very narrow, being little more than a consideration of the Five Orders. Neither Evelyn nor Addison had the slightest sympathy with Gothic work, and they may be taken to represent the cultured feeling of the age. The Renaissance had now developed to such an extent as to produce little more than copyism of Italian buildings without suitable adaptation to English wants. Architectural design was amateurish and artificial, and its professors were far behind the great masters, Inigo Jones and Wren, in ability. The large houses, of which many were built for great nobles, were devised for display rather than comfort. The state apartments were large and magnificent, and the exteriors were stately and striking, but the family apartments were tucked away as best they could be, without regard to the first principles of house planning. The smaller houses, however, were much more pleasing, and there are few towns which do not possess specimens of the Queen Anne or Georgian house, simple and appropriate in design, and marked with enough character to render it interesting. The interiors of these smaller houses are generally well treated, and the woodwork of the period still furnishes abundant hints to designers of the present day. One inheritance we have from that time which alone would render it memorable, namely, the sash window.—A vote of thanks to the lecturer was moved by Mr. J. Smith, seconded by Mr. C. Hadfield, supported by Mr. C. J. Innocent, and carried unanimously.

FURNITURE.

The Architectural Association of Ireland held its usual fortnightly meeting in the Grosvenor Hotel, the President in the chair. Mr. T. R. Scott delivered an interesting address on "Furniture," chiefly from a practical point of view. The lecturer illustrated his remarks by a large number of specimens of work, finished articles of the Sheraton and Chippendale periods, and examples of early Victorian, these last chiefly as specimens of what to avoid in design and construction. Mr. Scott dwelt on the importance of allowing sufficient time in which to execute an order, reminding his hearers that there was no such thing as timber over 3in. thick seasoned fit for immediate conversion into articles of furniture. Hence, he said, architects should design so as to admit of small scantlings being used, and, if necessary, built up to avoid the use of great masses of solid wood. The lecturer strongly advocated the great utility of dowelling as opposed to tenoning for indoor joinery.—Mr. Moore proposed a vote of thanks, saying he had often been troubled to get a tenon in

certain bits of construction which would really hold the work together without cutting away all the stuff, and said dowelling appeared to afford a valuable method of dealing with certain problems.—Mr. R. M. Butler, in seconding the vote of thanks, said it was oftentimes a source of difficulty for an architect to know the very best method of construction in every handicraft, and one felt small if some shop foreman pointed out utter impracticabilities in a working drawing. Lectures like Mr. Scott's would do much to tell the members many things that could not be learnt from books.—Mr. George Sheridan and Mr. Holloway also spoke.—The President, in putting the motion, said many theorists said an architect should first be a craftsman then a designer. He supposed one should first spend a year or two in a carpenter's shop, then in a forge, another year at a cabinet maker's, another at a stained glass works, and yet another at a foundry; and if the architect then had any spare time he might devote it to picking up something of Architecture; but he thought the nearest thing to such a course in these times were lectures like these.—It was announced that Mr. A. W. Moore had been appointed joint-secretary in the room of Mr. Gleave resigned, and that Mr. George Sheridan, A.R.I.B.A., had been co-opted a member of the committee, to fill the vacancy created by Mr. Moore's appointment, and Mr. Joseph Geoghegan had been appointed honorary librarian in the room of Mr. Frederick Hicks resigned.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The first meeting of the Session 1897-8 was held at 32, Sackville Street, Piccadilly, Mr. Thomas Blashill, in the chair.—The Rev. J. Cave Brown, M.A., exhibited an elegantly-shaped vase of terra-cotta of mediæval date, and found in the neighbourhood of Maidstone.—Mr. J. Chalkley Gould submitted several good examples of James II. base coinage, 6d., 1s., 2s. 6d., and 5s., respectively, known as "Irish Gun Money," and read some notes descriptive of them, partly derived from Gill's "Manual of English, Scotch, and Irish Coins." This "gun money" was issued by James II. after his landing in Ireland in 1689 with 5000 followers, in order to obtain the necessary funds for the prosecution of the war he had commenced for the recovery of his throne and dominions. His first step was the issuing of a proclamation increasing the value of English coins in circulation, which was soon followed by the manufacture of this "gun money," consisting of six different pieces, made of copper or brass and baser metals, the materials being obtained by the melting down of old copper pots and kettles and old brass cannons. Another coinage of this period was that of pennies and halfpennies of tin or white metal, having a plug of "Prince Rupert's" metal inserted. Mr. Gould also exhibited some examples of James's British pewter coins, which circulated also in Ireland, having a plug of copper or mixed metal in the centre of each.—Mr. C. H. Compton, V.P., read a paper on Rhuddlan, a village in Flintshire, where are the ruins of a castle, which were formerly a hospital, a priory, and a preceptory of Knights Templars. The earliest record of the place occurs in A.D. 795, when a battle was fought between the Saxons and Welsh, in which Caradoc, King of North Wales, Meredyth, King of Dyvid, and Offa, King of Mercia, were slain. Very little is known of the hospital; it most probably merged into the priory, which lasted till the dissolution, when it was granted to Henry ap Harry, 32 Henry VIII. The castle is said to have been built by Llewelyn ap Silto Yllt in A.D. 1015, and after frequently changing hands between the English and Welsh, it was held by King Edward I., when he conquered the Welsh on the death of Llewelyn in 1282, and it was here that the terms of the Welsh Capitulation, known as the Statute of Rhuddlan, was signed on the Sunday in Mid-Lent in 1184.—The Chairman made some observations descriptive of the formation of the castle, and Mr. Worsfold, Mr. Patrick, and others took part in the discussion.

Correspondence.

SANTA SOPHIA.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—It is, perhaps, due to your readers that I should be permitted to add a postscript to the article on the Dome of Sta. Sophia which appeared last week.

In speaking of the methods adopted for graduating the vaulting, it is implied that of the vertical faces of the supporting arches for the pendentives, only a few inches are exposed. This is not, of course, strictly correct, for they are really much deeper. It does not, however, affect the principle so manifest in the vaulting of this building, viz., of producing as gradual a transition as possible in the various surfaces; for probably one of the most striking instances of its application is presented in these very arches, which, on the east and west, are almost deprived of their identity by being merged into the semi-domes of the main extension.—Yours faithfully,

JOHN A. MARSHALL.

Nov. 8th, 1897.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

A POINT OF LAW.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will you kindly give me your legal opinion on the following case:—In the year 1882 A buys an estate (No. 1), and to drain it buys a second (No. 2); he afterwards sells No. 2 to B. B sells to C, who now wants to erect new offices, but is prevented by local

authorities on account of the sewer running under proposed new buildings. Can C cut off the drain or claim damages, or what is his best remedy? No mention is made of the drain running through the land in conveyance from A to B or B to C. QUERY.

We have laid your enquiry before our solicitor, who has taken counsel's opinion on the point. The opinion is as follows:—"Assuming the facts to be as stated in the question, and that there are no other material facts undisclosed, I am of opinion that C can cut off the drain which passes from A's land under C's land. A is committing a trespass, and has no right to do so, even for sanitary purposes."

The galvanised iron buildings at the South Kensington Museum, which have for the past forty years disfigured the Cromwell Road, Kensington, have now been entirely removed.

Trade and Craft.

THE DURESCO WATER PAINT.

The Silicate Paint Company is the manufacturer of the Duresco water paint, which, for the last twenty years, has been employed as a substitute for paperhangings and other decorative work. It is not a distemper, as some would believe, but a preparation of ingredients which produces a textile-like surface in varied and beautiful tints. Its advantages over distempers and paperhangings are unique. Duresco being the same depth of colour, wet or dry, and, possessing hardening qualities, it can be thoroughly washed repeatedly with soap and water without any danger of injurious effects. Further, it is said to be impervious to damp or any climatic changes, hence its value from a sanitary point of view, whilst it does not scale off when once applied, and thus obviates the expense and trouble of having to be washed and scraped, as is the case with ordinary wall-papers. Amongst other qualities, Duresco is said to be so durable that it hardens and petrifies soft or poor plaster, and can be used as a fireproof paint on woodwork, interior and exterior, and on painted and unpainted surfaces. It is also considered to be cheaper than oil paint for smoke or water-stained ceilings before distempering, as it dries in a few hours, thus allowing the work to be finished in a day. Messrs. John Line and Sons, of London and Reading, have been appointed sole wholesale agents by Messrs. J. B. Orr and Co. Ltd. (proprietors of the Silicate Paint Company), and specimens of the Duresco work can be seen at their premises, 50, Berners Street, Oxford Street, W. Duresco certainly possesses qualities which claim careful attention.

THE EDISON AND SWAN UNITED ELECTRIC LIGHT COMPANY LIMITED.

An artistically-prepared "Historical Review of the Introduction of the Electric Light into England" has recently been issued by the Edison and Swan United Electric Light Company. The review details the progress made from the introduction to the present day, and by the aid of finely-printed illustrations shows the vast improvements in various kinds of lamps switches, and dynamos. The Company manufactures the High Voltage lamps, such as are now being introduced into the circuits of many of the leading electric light companies, and which require a pressure of from 200 to 250 volts. It is also the maker of the Admiralty lamps used in the Navy; the High Efficiency lamps, which consume a small amount of power for the light given; the Long Duration lamps, which last, under proper conditions, from 5000 to 10,000 hours, by using a larger amount of power; and the Standard Edison lamp, which is suitable for general use. Each of these lamps has special advantages. Provided the voltage is uniform, the High Efficiency lamp is the most economical where the Board of Trade unit of electric energy is expensive. Where the pressure is variable, and the cost of the electrical supply fairly high—for instance, sixpence per Board of Trade unit—the Standard Edison lamp is recommended; but where the electricity is supplied more cheaply, as on board ship, in factories, &c., the Long Duration lamp is said to be most economical. The Company has long since discontinued electrical installation work, but some idea of the extensive productions of its manufactories may be gathered when it is stated that it has nine different sections for making the ordinary and special lamps, fittings, holders, switches, shades, cables, wires, casings, heavy plant, instruments, and all the accessories for electric lighting. The Company is the inventor of one of the latest forms for advertising, the Edison Patent Kaleidoscope Sign, the revolution of colours being produced by an electric motor. Amongst other specialities of the Company is the Anti-Shock Tumbler Switch, strongly recommended for use on high voltage circuits. It is fitted with a special enamelled iron liner or cover, which envelopes the working parts of the switch,

thus preventing contact between the outside and the live contacts. The Ediswan Quick Break Chopper Main Switch is one of the latest switches introduced, and it is capable of shutting off all circuits from 12 to 200 amperes with remarkable rapidity. Of dynamos, one of this Company's most improved pattern is the Ediswan Continuous Current Dynamo, which is stated to be able to work at a very high speed without any undue wear and tear or vibration.

DEN ANKERSKE MARMORFORRETNING.

Some interesting particulars of the marble industry of Norway are given in a circular issued by this Norwegian-Danish Society. In Norway, marble is found in many districts, partly as calcareous spar marble and partly as dolomite marble, of varied colours and of different physical and chemical qualities. From ancient times it has been used in buildings, for walls in rough blocks, outside doorsteps, &c., but, comparatively speaking, it is only quite recently that it has been employed in the construction of buildings. The quarries in Nordland were not worked till 1882, but from that date, first by private enterprise and now on a larger scale by the above Society, the workings have extended into a great industry, in fact, sufficiently large to warrant exportation. The Society's head manufactory is at Fredrikshald, and it has a branch at Copenhagen. The productive machinery at the quarries having been enlarged, it can now deliver more than 6000 cubic metres a year, but this production can be increased to any quantity, as this Society possesses the title to many inexhaustible quarries throughout Norway. At present seventeen kinds of marble are manufactured by the Society, one of the principal being the white Furuli marble, which has been employed with good effect upon several buildings (notably at the Opera House, Stockholm), the marble being in demand on account of its pure, warm, and white colour, as well as its suitable corn. Of the seventeen kinds referred to, four white ones are dolomite marble, viz.:—Blanc Statuaire Furuli, a pure white statue marble; Blanc Furuli, a pure white dolomite marble; Blanc Furuli 00, a white with blue gray veins and streaks; and Blanc Furuli 000, a white with blue gray bands. The others are all calcareous marbles, but still there will be found in the red Breccies some white fragments of dolomite. The dolomite is of a heavier specific weight (2.87) than the calcareous marble (2.72) and of a greater hardness, 3.4 to 4, against 3 for calcareous, and at the same time it offers a better resistance to chemical influence. It has been proved that the white dolomite marble from Fauske, even in London, has preserved its fine white colour for several years, while Italian calcareous marble, after a short period, even in a comparatively clean atmosphere, gets darker, and assumes a gray, plain-looking exterior, caused, it seems, by a sort of oxidation on the surface. The solidity of the Norwegian dolomite, as to pressure, is unusually high, according to the tests applied, and thus the white Furuli marble is considered to be of good use for building purposes. Like all other materials, the marble gets blackened by downrunning dirty and sooty water, on account of which cornices and bands ought to be well furnished with water noses. On the building belonging to the Standard Life Insurance Company, Copenhagen, the front, from the socle to the top, is made exclusively of white Furuli marble, and the cornices and bands have, for protection in this respect, been covered with projecting slabs of slate, which, by their black edges, show very effectively the lines of the front. This marble has also proved to be extremely good for sculpture, but being much harder than the calcareous marble, the tools must be harder steel for turning and planing. The Society can also supply several kinds of coloured marble, all nicely tinted and streaked.

At a recent meeting of the City Commission of Sewers at the Guildhall, an arrangement was adopted for acquiring the freehold of No. 97, Fleet Street, for £5000, with a view to the widening now in progress there.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARKING.—For the supply and erection of twenty cast-iron and five welded steel ventilation columns, &c., for the Urban District Council. Mr. C. J. Dawson, Surveyor to the Council, Barking:—

Columns.—D. T. Dawson, Barking*	£100 0
Nine Manholes.—D. T. Dawson, Barking*	95 0
Cast Iron Columns only.—Falkirk Iron Company	52 0
Both Kinds.—Bird and Co.	37 5
Steel Ventilators only.—Pigott & Co., Limited	142 15

* Accepted for both.

BEXLEY (Kent).—For the erection of a block of three houses in the main road. Mr. St. Pierre Harris, architect, 8, Ironmonger Lane, E.C., and Orpington:—

R. Butler	£1,040 0	S. A. G. Elms	£895 16 10
F. Wood	1,027 0 0	J. Lonsdale	833 0 0
T. Knight	989 0 0	Stebbins and Pannett*	748 0 0

* Accepted.

BOURNEMOUTH.—For alterations, additions, and painting at the Sanitary Hospital, Boscombe, Bournemouth, and other works in connection therewith. Mr. F. W. Lacey, borough engineer and surveyor:—

F. Hoare and Sons	£267 10	Jenkins and Sons	£279 0
J. Miller and Sons	612 0	J. McWilliam & Son*	545 0

* Accepted.

BRISTOL.—For the erection of a new girls' school (to accommodate 420), and for enlargements and alterations to the present infants' school, Summerhill, for the St. George's School Board. Mr. F. Bligh Bond, architect, 51, Cornstreet, Bristol:—

	For Contract 1.	For Contract 2.

AND MOST SUCCESSFUL PASSENGER LIFTS IN THE WORLD

Surveying and Sanitary SUPPLEMENT.

NOVEMBER 17TH, 1897.

Practical Carpentry and Joinery.*

By GEO. ELLIS.

(Continued from page 264.)

THE MANSARD ROOF (Fig 39), called after a French architect who popularised it in the seventeenth century, is formed by framing a king-post truss over a queen-post truss of different pitch, they are designed to utilise the roof space as a room, and also to reduce the height of the roof. The lower tie beam having to carry a floor and ceiling, and the queens not being in the best position to support it, must be of greater depth than would be required for an ordinary queen truss of the same span. There are several methods of describing the outlines of these roofs, that shown in Fig. 39 is a favourite method. Describe a semi-circle on the upper edge of the tie beam with radius equal to half its length. Divide the curve into five equal parts. Draw the top edge of the upper tie beam at the height of the first division, a perpendicular through the centre will locate the apex, and these three points joined by straight lines on either side will give the outline of the roof.

HAMMER BEAM ROOFS, of which those of Westminster and Hampton Court Halls are splendid examples, depend for their rigidity upon the strength of the walls supporting them, as, having no tie beams, the tendency of the rafters is to spread at the bottom. The thrust, however, is not great when a true pitch is used—i.e., the length of the rafter to equal the span, the outline of the roof forming an equilateral triangle. The one at Westminster nearly approaches this; but Hampton Court is a Mansard, which, probably, has something to do with the symptoms of failure now apparent, although erected nearly 200 years later than the other. A collar beam is usually introduced to stiffen the upper part, the weight passing down the hammer post to the outer end of the hammer beam, from whence it is carried by an angle stay, frequently a curved rib, to a corbel placed some distance down the wall. The collar beam is supported by ribs or brackets springing from the hammer beam, and also by a king-post, or puncheon, suspended from the heads of the principal rafters; the feet of the rafters are framed into the horizontal hammer beam, setting up a counterpoise to the leverage effect of the upper part, acting through the ribs and hammer post; and any sliding tendency is effectually checked by an iron bolt tying them to the bracket or wall piece. It will be noticed that the strength of these roofs lie rather in the exquisite balancing of the thrusts, than in the proportions of the

component timbers, which seem to have been determined more by the nature of the ornamentation than the requirements of the construction. Fig. 40 represents in outline the roof of Westminster Hall; R, is the principal rafter; P, the puncheon, or king-

post and hammer block and continued to the wall piece; W is the wall plate; W B, wind brace. The spandrels are filled in with pierced tracery, and all the members richly ornamented with mouldings and carving. Fig. 41 is a sketch of the foot of

FIG. 40. OUTLINES OF WESTMINSTER HALL ROOF.

post; H, the hammer beam; H P, the hammer post; H R, hammer rib or bracket; F, the flying rib; M, the main rib (this is in two pieces, notched over the principal members, and is evidently used as a brace); C, the collar beam; S, straining beams; I, struts; Pu, purlins; L, the corbel; K, the wall piece; N, the hammer block; Co, counter rafter, framed into

a hammer beam truss, of small span, drawn to larger scale than the previous example, and showing clearly the mode of construction. The foot of the wall piece, K, should be dowelled to the corbel, and a short strut, S, is framed between the front wall plate and the common rafters, C R, to take the weight of the gutter, G, is a snow grating.

FIG. 39. A MANSARD TRUSS.

DETAILS OF ROOFS.—*Hip rafters* are used at the intersection of the inclined sides and ends of a roof, and are necessarily deeper than the common rafters, as they are of less inclination and longer span; they exert considerable pressure at the junction of the wall plates, and to withstand this it is usual to frame them into a dragging or dragon tie (Fig. 42). The wall plates are dovetail halved, at the angle, and about 2ft. to 4ft. from the end, are crossed by the angle-brace, A, notched down on the plates; one end of the dragon beam is tusk-tenoned into this, the other end being notched over the angle of the wall plate; the end of the hip is butt-tenoned into a mortice in the dragon beam. *Valley rafters* are those at the re-entrant angles of a roof. They do not need any tie at the foot. Valleys are usually boarded and covered with lead to form a gutter. When the intersecting roofs are not of the same height, the higher one is continued through, and 1in. by 9in. valley boards are nailed up the rafters on either side, in the position that would be occupied by valley rafters. Upon these are fixed the feet of the jack rafters of the subordinate roof. The short, common rafters, cut by the hips and valleys, are termed *jacks*. Fig. 38 is a diagram of a hipped roof, showing the position of the various parts, and the methods of finding the lengths of common, hip, and jack rafters, with the bevels and backing of the hip. To find the length of the hip rafter, erect a perpendicular from the point of plan where the hip meets the ridge. Set off the vertical height on this, obtained from the transverse section; join this point to the end

FIG. 41. A HAMMER BEAM TRUSS.

of the rafter in plan, and the line will be the true length of hip; the angles at each end of the hypotenuse of the triangle thus formed will give the side bevels for the hip rafter. To find the length of jack rafter, draw a line perpendicular to the plan of the hip from the point where it is cut by the plan of the jack, produce it till it cuts the elevation of the hip, found as described in the previous paragraph, with this distance as radius, describe an arc cutting a perpendicular drawn from the plan of the jack. Draw a line from the intersection to the foot of the jack in plan, which will be its true length. To find the backing of the hip, from any

point in the elevation of the hip draw a perpendicular cutting the plan as at C in the diagram; from this point, with the line as radius, describe an arc cutting the plan. From this point draw lines to points on the wall plates, intersected by a line through C at right angles to the plan of hip; this will discover the dihedral angle of the roof, usually called the hip backing.

GUTTERS are named either from their section or position, as angle (Fig. 43), box or trough (Fig. 44), parapet (Fig. 39), OG or eaves gutter (Fig. 32), V-gutter (Fig. 31), half-round (Fig. 41), secret (Fig. 45). The trough, half-round, angle, and secret, are parallel in plan, the others are tapering, due to their rise up the sides of the roof, and should have a step or "drip" of 2in. every 8ft. or 10ft. where joins in the sheets of lead are made. Each of these sections should have a fall of at least 1 $\frac{1}{2}$ in. to give impetus to the water; and a cesspool should be provided at the lowest point, about 12in. by width of the gutter, to collect the water and discharge it with force to the Hopper head, or down-pipe. The lead linings of the cesspools should be bossed up in the solid, and not soldered at the angles, and a wire cover should be placed over the outlet to prevent leaves, &c., passing down into the trap. All wide gutters should be fitted with snow gratings, of which Fig. 46 is a section, to prevent snow choking the waterway and causing an overflow under the slates; they are also useful to prevent the wearing of the lead by workmen repairing the roof, &c. The battens should be nailed to the arched bearers about $\frac{1}{4}$ in. apart, if wider, the snow will fall through and freeze, and they should not be more than 10ft. long or they become unwieldy. The secret gutter formed in the back of a hip rafter (see Fig. 45) is used where rolls or purpose-made ridge slates would be undesirable, a groove 2in. by 1in. is made in the edge of the rafter and lead dressed in and over the edges, the slates abutting over with a very slight joint. Fillets must be nailed at the sides of the hip to carry the jack rafters. *Lead flats* are subject to the same rules as gutters in respect of fall and drips; the sheets of lead are jointed at the sides by turning them over 2in. wood rolls fixed to the boarding spaced about 2ft. 10in. apart (the average width of sheet lead). The boarding should be laid in the direction of the fall, so that in case of an edge lifting it will not cause an obstruction; as a further precaution the boards should be laid with their heartsides upwards, for reasons refer to article on timber on page 123 (No. 136). All the sharp arrises must be taken off and the edges of the drips rounded to prevent the cutting of the lead.

At a sale of timber on the Troston estate in Suffolk, one of the lots was a fine oak, which was brought by Messrs. Rattee and Kett, of Cambridge. It was 24ft. in length, with a girth of 48ft. 6in. It weighed 15 tons, and was drawn upon a drag to which ten horses were attached. Mr. J. Baker, of Peterborough, was the haulier. This is said to be the biggest oak ever cut in Suffolk.

THE OPEN-CHANNEL IN SANITARY DRAINAGE.

By C. E. GRITTON, A.M. Inst. C.E.

THE open-channel, straight and curved, both semi-circular and three-quarter round in section, as now made in beautiful glazed ware, is of the greatest value both for the bottoms of manholes to convey sewage, and also above ground for rain-water and clean waste conduits. But directly it is used above ground for carrying greasy or impure wastes, as from urinals, it becomes an intolerable nuisance, only rendered less in degree by constant attention and cleansing, in itself an insanitary and disagreeable operation. The leading feature in all true sanitary work is to reduce all fouled surfaces as much as possible, and the man who makes a scullery or pantry sink or a urinal discharge into a long open-channel which in

FIG. 42. A DRAGON TIE.

turn discharges into a gully, shows either his ignorance of or contempt for the above enunciated canon of sanitation. Curiously enough this insanitary practice is asked for in two such dissimilar and divergent districts as Croydon — which owes so much of its healthfulness and repute to sanitation — and Cambridge, which, to put it mildly, does not come up to the Croydon standard! It is too often overlooked that this bad custom is simply a relic of barbarism. In the days of our grandfathers such waste pipes were either directly connected to drains or made to discharge untrapped over traps (too frequently "bell traps.") Any smell arising in or from the trap is then promptly passed up the waste-pipe. In these more civilized days a smooth drawn lead trap is fixed immediately under the fitting, the waste-pipe of which then discharges into a self-cleansing circular

gully outside the house. No smell from the gully can pass up the waste-pipe, and the introduction of a long or short open channel with the object of preventing a thing which is already impossible is a work of supererogation, as well as an evil. Recently I have had to alter the drainage of an important Institution where a tremendous amount of cooking

FIG. 43. ANGLE GUTTER.

is done, and consequently a vast quantity of grease accumulates, or I may now say used to accumulate. I found the scullery sinks discharging into glazed open-channels with much splashing and fouling of channels, walls, &c. Not satisfied with this large and entirely unnecessary fouled area, the authors of the scheme had caused these channels to discharge their offensive contents into large rectangular grease-traps which retained the grease upon the premises, and the sour smell of the putrifying grease in these channels and traps pervaded the place, the grease offending the eyes, and the stench the nose, in fact sickness and sore throats were attributed—no doubt justly—to the horrid effluvia. All this has been swept away. The sinks now discharge properly through ventilated and trapped lead waste-pipes (with expansion joints) into circular flushing-rim gullies in the open air, and large automatic flush-tanks discharge through flushing-pipes of ample area into these gullies

FIG. 44. TROUGH GUTTER.

at sufficiently frequent intervals to break up all the grease and sweep it through and out of the drainage system without trouble or attention. All smell has been removed simply by reducing fouled surfaces to a minimum. This is only another proof—among many—that this old-fashioned and sanitarily bad requirement should be removed from Sanitary Bye-laws.

Surveying and Sanitary Notes.

Writing on the sanitation of Gibraltar, a Daily Telegraph correspondent says: "In consequence of the construction of new docks, the existing sewer will be cut off at the New Mole, and a new sewerage tunnel, from the market place to Europa Lighthouse, commenced in 1896, will soon be completed, under the supervision of the resident engineer, Mr. Rowland Brotherhood, appointed by Major Tulloch, R.E., C.B. All drains and sewers along the route will be connected to it, and the sewerage of those on a lower level will be lifted into it by ejectors. Up to the present, 13,000ft. of tunnel have been finished, leaving only 3000ft. to finish the work. The tunnel is high enough for a man to walk through upright, and, when finished, as it will be in about six months' time, will be one of the finest concrete sewers in Europe. The system is, doubtless, a good one. The tunnel, which has a gradient of one in 1200, will be flushed from the highest point from a reservoir holding 20,000 gallons of sea water, lifted from the sea by centrifugal pumps. At equal distances flushing gates are fixed. The immense force of water thus sent through the sewer will carry all impurities before it straight out into the Mediterranean, where the tides will carry it to sea. At Camp Bay there is another reservoir to be constructed, for use in the dry season. Endless difficulties have had to be overcome in boring nearly the whole length of the rock, just below the level. The work reflects great credit on those concerned, and the present comparatively low death-rate may safely be predicted as being considerably reduced when the new scheme is in working order, and the further health of our soldiers and sailors insured.

ASTONISHING is the rapidity with which houses are being erected in Aldrington and north of the railway line at Hove. The Portland Road Board School was, but a few months since, in a comparatively isolated position, but it will, in a week or two, be surrounded by half-a-dozen new streets. Habitations are, in fact, being run up in the neighbourhood as if by magic. To the west of Rutland Road and north of Portland Road, several of the new rows of dwellings have been nearly completed, and when all have been finished some 350 homes, intended chiefly for the working classes, will have been added to the available dwellings in Aldrington. Houses are, in fact, being built from Glebe Villas and Portland Villas to within close proximity and north of the old parish church at Aldrington, and some substantial shops will shortly occupy positions on the north side of Station Road, Portslade, near to the railway station.

An interesting conference of the members of the North-Western and Midland Sanitary Inspectors' Association was recently held at the Birmingham Council House. Mr. W.

Urquhart (Crewe) presided. Mr. W. Wilkinson (Derby) opened with a speech on "Should sanitary inspectors be under local or State control?" He claimed for the officers absolute security of tenure of office, and urged the need of a central controlling authority, to which sanitary inspectors might have the right of appeal before dismissal. There were numberless cases in which sanitary inspectors had suffered appreciably from the fearless discharge of their duties, and they asked for some guarantee that men placed in such a responsible position should not be liable to dismissal without an impartial inquiry,

FIG. 45. SECRET GUTTER.

removed from local and vested interests. A resolution was passed suggesting reforms in sanitary legislation, which, amongst other items, was in favour of a National Board of Health, its president to have a seat in the Cabinet, and the certification of all inspectors. Mr. J. Hughes. (Rhyl), in seconding the proposition, observed that if the authorities at Maidstone had awakened to the real responsibilities of sanitary administration, there would have been no risk of a secondary outbreak of typhoid fever. A resolution was passed in favour of the superannuation of sanitary engineers and in favour of introducing a special Bill into Parliament. The conference discussed the question of unity of action, and visited the corporation interception department and sewage farm.

In connection with the important sewerage scheme for Armagh, the Sanitary Committee has selected a piece of ground in the townland of Drumcaine, which, it is understood, is

FIG. 46. SNOW GRATING.

admirably adapted for the purpose, and is approved of by Mr. J. Finlay Peddie, C.E., from an engineering point of view. The next step will be to obtain the approval of the site by Mr. Parry, C.E., consulting engineer, and when this has been obtained the provisional order to secure the usual rights will be applied for by the Board.

An Architectural Causerie.

Surbiton! PLEASANT Surbiton upon the Thames, not to be behind-

hand, has duly aspired to a place in the annals of architectural hocus-pocus; and has found it. The precise details of these last junkettings of District Councillors will be found stated in another page; here one has particularly to complain of local big-wigs, and the ponderous nature of their big-wiggedness. If, as seems now pretty well established, public competitions are to be instituted and conducted by men who keep one eye shut and their tongue in their cheek, throughout their transaction with architects, one feels entitled to ask and expect that they shall put a little originality and brightness into their enterprise. As it is, the thing is growing wearisome; it begins to pall. The gull is always on the same monotonous lines; the bunkum is in all cases of the same matter and quality. The tale is always the same, and it is now grown tedious to hear by repetition. With all the practice they have had in the art of "houssing," the Town Councillor of England should be able to show a little more briskness and daring. "Tottenham" truly was refreshing, and promised well; it was a thought sordid, but it promised well. "Let us wash our hands of the whole competition and have another" was good; and "Dear Sir,—The Board have decided to return the designs to the various competitors, and to have a fresh competition" is even better; but now comes "Surbiton" on the old dull, humdrum lines, with the same dingy, uninspired old tale again re-told, and hardly an incident by which one can identify it in the future, or an episode by which one can distinguish it in the present from the vulgar crowd of municipal architectural competitions in general. In the whole narrative there are but one or two incidents which stand out from the dullness of the bulk, and linger fleetingly in the mind. The most remarkable of these is the fact that the Council dissented from its assessor's decision before the sealed envelopes were opened. This is a quaint and curious irregularity on the part of a District Council. It is usually only after the contents of the envelopes have been revealed, that the town councillor attains to that confidence in his discretion and taste that braces him to oppose the award of the assessor. It would seem as though the act of breaking those seals freed a talisman, which instantly cleared the councillor from perplexity and doubt on every question of Architecture, and yielded him instantly an assurance of view upon debatable points, that the best qualified specialist might envy. Since, by his own showing, the opening of a sealed envelope qualifies a town councillor, beyond all question or doubt, in the issues and technicalities of plan and elevation, why is it that he pays a heavy fee to a professional assessor? This strikes one as an interesting speculation. It would hardly seem possible that the town councillor employs the assessor because, as an inducement to intending competitors, he has promised to do so in the "Conditions of Competition." There is no evidence to lead one to suppose that an ordinary Municipal Council recog-

nised any such obligation. Another particular in which the story of Surbiton wins one's appreciation relies on the fact that it has afforded the public the pleasure of an introduction to the idiosyncrasies of Mr. Palmer. Mr. Palmer has made a most plucky attempt to embalm himself in the amber of the architectural world's derision. One is inclined to believe that he has succeeded. Standing officially before his fellow councillors he is reported, in the Surrey Comet, to have broken breath in saying that "he objected to his responsibility, as a member of the Council, being thrown on the shoulders of the assessor. He did not think they should take too much notice of specialists or experts, for they were dangerous people to follow.

Councillors" of remoter Britain. Probably this is the solution. Mr. Palmer does well to guard his common sense; it constitutes a proud prerogative. When one comes to consider, not the moral obligations of the case, but the mere literal rights and titles of the municipal representatives of Surbiton, the matter seems to focuss in the wording of "clauses 1, 4, and 5 of the conditions of competition." They are as follows: "1. The Council have appointed Mr. E. W. Mountford, F.R.I.B.A., to act as Professional Assessor in advising as to the conduct of the competition and selection of designs." "4. The author of the selected design will be employed to carry out the work, subject to the condition that he be a bona-fide architect," &c., &c. "5. If

"BLEAK HOUSE" GATE. FROM A PHOTOGRAPH.

They should use their own common sense." One is glad Mr. Palmer has recommended his terms as being those of common sense. One might otherwise have overlooked it. Even now it is hard to realise that Mr. Palmer's sense is really at all common; nothing is, in reality, so uncommon as common sense. No doubt, however, it is as he states. One is therefore sorry to have to say that Mr. Mountford (the assessor) does not agree with Mr. Palmer on the subject of plans. It is another fond belief shattered; hitherto one had been convinced that Mr. Mountford was an adept among adepts in planning. One had, however, reckoned without one's Mr. Palmer. Perhaps a man may be an adept among adepts and yet not be an adept among the "District

by any sufficient reason the design placed first be not carried out, then the design placed next in order by the assessor shall have priority of consideration, and failing that also, the next, and so on." One has added the italics here to emphasise the terms particularly bearing on the case. The word "advising" in Clause 1, though its literal value indicates that the Council was not bound to hold by any award of the assessor, is no more than the "approval of Council" with which every committee must, in reason, protect itself. The statement as to winner of the award carrying out the work is explicit. The words any sufficient reason, in Clause 5, one cannot think were fairly interpreted to cover the unsubstantiated caprice of the Plans-Sub-Committee—cer-

tainly not the common sense of Mr. Palmer. The general dissatisfaction of the twenty-six firms who competed establishes that the conditions were not interpreted in the sense in which they were read—or, one would venture, written. On the whole, however, one does not deplore the inequitable proceedings of the ordinary Town Council so much as the fatuity of architects in submitting to it. To sell one's birthright for a mess of pottage is justly considered to be the height of folly. One observes, however, that the architect also enters in competition, though he voluntarily sells his birthright—in yielding up his title to payment for the work he does—yet very rarely ever gets the mess of pottage for which he sells it. B. C.

An Artistic Architect and his Office.

TAKEN altogether, he was not a half bad chap; he was not really an architect, however, except from a courtesy he habitually extended towards himself, but which an erring public failed to follow up with the alacrity he would have desired. His limited correspondence came to an office located on the topmost floor of a large block of flats in Devonshire Avenue, and here, when saner people were at rest, he might have been found at work forming a number of pigeon-holes, which, except by mistake, he never used, or drawing plans suitable for the ideal client that only existed in his vivid imagination. The office was fairly roomy, about twenty by twelve, probably, and was entered from a doorway on one of its shorter sides; at the further and opposite end was a window occupying nearly the whole width, below it was the architect's drawing table. A bookcase, reaching from the floor to about 7ft. high, filled in one of the long sides, that opposite being partly monopolised by the fireplace; on either side were hung portraits of Thoreau and Ibsen, and over the mantelpiece Mary Woolstonecroft and Karl Marx. The books that lined the dusty shelves of his deal bookcase indicated his limitations. Whitman was the only poet adequately represented. In addition to the works of Whitman was a small volume of poems by Shelley squeezed in between "Das Kapital" and Schopenhauer's "Counsels and Maxims," but it had been purchased out of curiosity rather than from a real interest, previous to a lecture by a woman friend who regarded Shelley in the light of a second saviour of mankind. The volume had been religiously studied, but without any result further than to excite his anger that a man should have written such sentimental twaddle, as he called it—a habit of mind common to others besides this artistic architect, when they fail to comprehend. Buckle's "History of Civilisation," ten or twelve volumes of the social science series, several books by Hardy and Meredith, a well-thumbed Bible, and a volume or so of Zola, showed his predilections in literature. His architectural books were numerous, and ranged from "Egypt under the Pharaohs," by Brugsch, to "Town Life in the Middle Ages," by Green. Copies also of Shaw and Nesfield's sketches on the Continent, a few architectural plates, illustrating modern work, by Webb, Shaw, Sedding, and McClaren, and one drawing of a beautiful little girl, designed by Chas. E. Dawson, pinned against the wall. To enter his office and fail to offer up incense to these illustrations was considered nothing short of an insult, and it was not infrequent for the artistic one to drive an inoffensive visitor from the room down the long flights of stone steps, sending after him a storm of coarse invective that might have been equalled, but seldom surpassed, by a bargee or navvy. No visitors had as yet come to see him this evening, and since the

departure of the little office boy with red hair, who had a passion for doing enormous perspectives, its occupant had sat more or less idly next the drawing-board on a stool somewhat out of repair. The lamp on his right, turned low to prevent its smoking, burned dimly, and the fire in the grate suffered from lack of coal and a want of attention. His receding forehead and chin, outlined against a sheet of drawing-paper on the left wall, seemed to emphasise and illustrate the Darwinian theory; doubtless at some remote period his ancestors were intelligent members of the simian tribe. This curious facial relationship was a subject for amusement among his friends, and was not so irritating to himself as might have been supposed—a certain aloofness of mind, combined with some sense of grim humour, enabled him to trace this resemblance in company with his amiable friends. His likeness to Amenophis IV., an Egyptian king, was unmistakable, and like him also, he was subject to attacks of the revolutionary spirit; a weakness which in the king's case was traced by his contemporaries to a feeble digestion and immoral tendencies, became in the architect merely a fondness for mild tea and vegetables, interspersed with an occasional orgie of sausages and mashed—sure and certain signs of a revolutionary bias. A sound of footsteps and laughter on the stairs brought him out of an idle reverie; another moment and the office door was pushed ajar unceremoniously, and the opening was partly screened by the spare figure of a woman. A face intellectual, a small mouth just now quivering with suppressed laughter, and a pair of eyes of uncertain colour, took in the whole of the room before the other fighting women—for such they were—could gain an entrance. The architect's office was now invaded by five women. The owner's melancholia and bored expression vanished, and although he simulated an indifferent air to prevent any too sudden and startling endearments, he was inwardly chortling over their temerity and the unbusinesslike atmosphere of his room. That his cigarettes should be purloined, and his drawing den turned into a smoking room by a group of enterprising Socialist women was not altogether displeasing to this whimsical young man. The smallest of them, the possessor of a fair and open face, sneaked his lamp, another coolly tickled him, and the others occupied their time by upsetting his bookshelves. It was now late, and wishing to work at a design for some embroidery, he turned them out without apology, not, however, before giving them an invitation to come and see him again, and also a design for a very impossible house for a client that had not yet arrived upon the scene.

G. LL. M.

The Illuminated Address.

If there be any occasion in which a written communication calls for good decorative treatment in its accessories, it is surely when it takes the form of an official address stalking through its phrases with the stately pomp and circumstance, warranted by centuries of use, that we consider the proper form in which to congratulate those in high places. More especially when such an one is the actual head of the realm might we expect to see our very best put into the arrangement and decoration of the address. One recurs to one's favourite page of the Kelmscott quarto lying on the table or to the book-plates of a discriminative friend, or is, perhaps, reminded by the poster at the corner of the street how far we have attained in the possibility of setting forth some simple statement in a manner that imparts to it an interest it otherwise lacks; then, letting one's

imagination dwell on the subject, mental pictures rise up of compositions endowed with all the beauties of gracious line and glowing colour—compositions in which fine massive colouring gives an excuse for decorative accessories full and rich in tone and massed so as to add dignity to the inscription. Alas for our ideals! one brief visit to the Imperial Institute dispels them all; here, if anywhere, would surely be found the best that the nation can do; here should we see some, if only a few, that rise to a high pitch of decorative interest. Down the interminable row one goes, hoping to the last that somewhere will be found a work rising above mediocrity. No, not one, while the great majority are of a class beneath criticism. Here, for instance, is an example bearing the initials of a celebrated R.A., whose conception of a suitable decoration for the purpose consists in placing a parti-coloured angel at the top, from whom meander pink ribbons that wobble aimlessly down each side of the inscription. Near at hand may be seen another displaying originality of a no less meretricious order; a third, from one of our seats of learning, is saved by the omission of ornament altogether, and is consequently at least as satisfactory as a well-engrossed mortgage deed. These, however, are the exceptions. In nine cases out of ten these documents display not the semblance of an idea of any artistic value. Their designers seem to have been trained, Heaven knows where, in the fixed idea that such things must be, above all things, mediæval, and that the mediæval could be very easily rendered by the use of straggling ornament of certain stock forms depicted in such lovely colours as vermilion, emerald green, ultramarine, &c., &c. It is an extraordinary thing that out of the enormous number of addresses sent up from all parts of the country, not one should have fallen to the lot of someone who could handle it in a manner representative of the time, and that, consequently, the three or four contributed from Germany, though not treated in a particularly appropriate way, are undoubtedly far superior to those of our own country. To anyone judging by these works only, it could not but appear that we had reached the very lowest depths of artistic degradation, and that we have, moreover, in some insidious way, destroyed all the vigour in the formerly very individual work of our Indian Empire. It is not encouraging, when one reckons up all that has contributed to our celebrations during the present year, how infinitesimally small a portion belongs to the various arts that are supposed to have an important place in our national life.

H. V. L.

"BLEAK HOUSE" GATE.

AT the end of a narrow alley in the purlieus of Drury Lane one may come across the door that figures in our front-page illustration. There would be but little to notice in it but for the fact that it is the gateway of the tiny graveyard to which Dickens, in his "Bleak House," makes pathetic reference, and which is brought into prominence in the transpontine melodrama founded on that novel. Dickens probably knew his London better than any other among its multitude of citizens; and that he found his way to this out-of-the-way spot, among the crowded tenements by which it was then surrounded, shows that his topographical knowledge was of no superficial character. Now the houses have gone, the weed-grown graveyard has become a well-kept playground, and the door that was formerly ruthlessly closed, swings open to admit the children from the crowded streets into the little breathing space beyond. Soon the exigencies of a more comprehensive scheme of improvement will sweep all away, and but a memory will remain of a feature that had a place in the literature of our century.

CHIMNEYS.

BY CHAS. W. T. TOMLINSON.

(Continued from page 324.)

WHETHER it is a fact or not, it is occasionally remarked that we cannot build a good chimney nowadays, and it is certain that smoky chimneys were never so common as they are to-day, and "chimney doctors," patent pots, &c., were never so much in evidence. Architects are being continually troubled with this everlasting problem of the smoky chimney, and they cannot always successfully grapple with the difficulty. The simple theory of the chimney comes to this: air, like nearly everything else, expands with heat and contracts with cold. Therefore, hot air is lighter than cold air, and has a tendency to rise. So the air gets heated in passing through the fireplaces, and rises up the flue, carrying up the smoke with it. (A fireplace opening should not be made too high, as the air might then cool before getting up the chimney.) Allowance, however, must be made for unfavourable situations. Take a case where a chimney is near to an high building—say on its west side. When a strong wind blows from the east, it will strike against the loftier building, and turn upon itself in gusts and eddies, thereby often sending a cloud of smoke down the flue. For this reason a chimney should, if possible, be carried up higher than any building near, and, on the same ground, a stack rising from the eaves of a roof should always be carried a foot or two higher than the ridge. But it is not possible, in every case, to carry a chimney stack higher than the surrounding buildings. If the case occurs as before-mentioned, of a high building next a low one, M. Viollet-le-Duc, in one of his works, says that the flue of the latter should bifurcate or divide into two, as shown in sketch. Then, he argues, when the wind happens to send a gust down one flue, it would only have the effect of forcing a big cloud of smoke out of the other, as it is hardly possible the wind would blow down both flues at the same moment.

The same author also speaks of the ordinary revolving cowl with only one opening, for, he says, a sudden gust or change of wind may blow full down it with exceedingly unpleasant results. If the cowl has two openings this would be avoided, as then the wind would blow straight through it. He cites, as a practical example of this theory, the town of Geneva, which is built against a hill side. The population are little troubled with smoky chimneys, as their flues are all fitted with cowls with double openings.

As before mentioned, it is always best for a chimney to pierce a roof at the ridge instead of the eaves. It is also much more economical as a rule, and it offers so much less resistance to the wind, being comparatively short compared to the long thin shafts we often see rising from the eaves. A wrought-iron stay-bar, fastened to a purlin, is very often required to prevent the latter type of stack from being toppled over by a strong wind.

With regard to the patent cowls, pots, &c., of to-day, their name is legion, and it is impossible to attempt any description of them. Of course, a chimney may smoke for other reasons than contrary winds; lack of draught, &c., an obstruction in the flue, though the latter rarely occurs.

There is a grain of comfort, however, in the fact that even the jerriest of all jerry-builders could not, if he tried, build a chimney that would always smoke, for in certain favourable winds even the most defective of badly-constructed flues will occasionally act properly.

With reference to the construction of tall factory or mill chimneys, this is a point which is a speciality in itself, and can hardly be considered as coming under the head of my subject, so can only just be touched upon. These chimneys need very heavy and substantial concrete foundations. They are always built with a batter or slope inwards, so as to make them more stable. Generally, the first 40ft. or 50ft. of their height is lined with fire-brick, on account of the intense heat. In a great many cases the lowest portion is

built in two parts, viz., an inner shell of fire-brick, and the outer casing or chimney proper, with an air space of perhaps 18in. between the two. The two portions usually unite at a point 50ft. or 60ft. from the ground. The thickness of the walling of a tall chimney is settled by the local bye-laws and by the Building Act, being fixed at a certain minimum thickness for the lowest 50ft. or so, then another minimum for the next portion, and so forth until the top is reached.

The subject of factory chimneys is one about which much might easily be written; in fact, Rawlinson and other eminent engineers have published large and exhaustive treatises upon their construction and design.

ARTISTIC.

Very few attempts are made to give a chimney stack an artistic appearance. Surely nothing could possibly be more unsightly, not to say hideous, than the ordinary square, heavy, brick stack, with its hard, brutal outlines and its apology for a cornice, consisting of about three courses plain oversailing. Then this most unsatisfactory object is finished with some strange-looking, almost grotesque, chimney-pots, probably one of the flues being treated to a "tall-boy" to remedy its smoking.

Surely something might be done to render these so very necessary objects a little more picturesque than they usually are, and it is gratifying to note that our leading architects do not consider the design of a chimney as a detail unworthy of their attention. An accompanying sketch represents a stack of one of the latest public buildings in Leeds, and most certainly a stack like this could not be termed an eyesore by even the severest and most fastidious of critics.

Besides being better for all practical purposes, it is certainly preferable on artistic grounds that the flues be gathered together, for it looks decidedly better to see one or two substantial stacks than to gaze upon an epidemic of single shafts breaking through the roof at all points. The effect of a chimney stack depends in a very great measure upon the plan. T or L shaped plans are more stable in character and much more pleasing in appearance than the usual type of three or four flues in a row, though hundreds of buildings are erected annually entirely destitute of any other idea of arrangement. The plan of a stack of four flues might be worked out somewhat in the manner suggested by the sketch, thus giving a little variety to the different faces.

An old brick chimney at Rye House has its plan formed of four semi-circles with angles between. In elevation the shaft is encircled spirally, each spiral performing about two and a-half revolutions. The base and cap are of cut brickwork. The total height of the chimney is about 13ft., and it is a most interesting specimen of this class of work. The Rye House is historically associated with a plot formed in the year 1678. It was termed the "Rye House Plot," and its object was to assassinate King Charles II. at the Rye House, where he was expected to tarry on his return from the Newmarket races. Fortunately the plot was discovered and frustrated.

Square chimneys set diagonally are to be found in many of the fine old brick halls of England. Exquisite examples may be seen at Severn End and Hampton Court. Hexagonal and octagonal shafts always look extremely well. Examples are shown in the illustrations of this form of treatment. It is always wise, however, to have purpose-made bricks for the angles and moulded work, &c., as a chimney shaft is, as a rule, in far too exposed a position to allow of the use of cutters or rubbers. These latter should only be used in those portions of a building which are fairly well sheltered. Special bricks, suitable for all kinds of ornamental work, are made by Jas. Brown, of Cannon Street, London, and good examples of their use may be seen in his illustrated catalogue, "Brick Ornament and its Applica-

tion." Where a chimney stack occurs at or near the eaves of a roof, the sudden break in the roof-lines often makes the shaft look taller and thinner than it really is, and in other ways jars upon the artistic temperament. When the chimney springs exactly from the eaves this break can be avoided by carrying up the brickwork and breaking it off gradually in a succession of little gables, as shown in the illustrations.

A chimney stack is often a feature in the gable of a Gothic building, and this method of treatment is much in vogue to-day. A chimney at a gable end makes a very picturesque combination by corbelling it out, say at the first floor level, and thus breaking up and giving more relief to the wall surface. A good modern example of this method of treating a shaft is to be seen at one of the gables of the

"CHIMNEYS." SKETCHED BY C. W. T. TOMLINSON.

new Sheffield Municipal Buildings, designed by E. W. Mountford.

In reference to the question of the height of a chimney stack, if an old model be followed, it should be remembered that the old bricks are much thinner than modern ones, and due allowance should be made for this in calculating the number of courses.

The above should be particularly in mind when designing the cap, as its effect depends in a great measure upon its proportions compared with the shaft. The cap, being, as is usually the case, the highest point of the building, should be designed not in elevation, but in perspective, as it would appear from the ground, and a little more height should be given to it than actually looks necessary in the geometrical elevation.

So far I have only mentioned in this section shafts of brickwork. Stone stacks should always have a plinth course, this giving them a much more stable appearance. A simple cornice (which, however, should always be weathered and well undercut) and plain stone cap is perhaps the best and neatest method or

East Bagham Hall

"CHIMNEYS."

SKETCHED BY C. W. T. TOMLINSON.

finishing the stack, though with a richly-moulded cornice, elaborately carved swags, &c., as are sometimes seen, a stone chimney-shaft may be enriched to almost any extent.

I give a sketch or two of some typical Venetian chimneys. Their appearance is most quaint, and certainly not unpleasing. They are most often built in single stacks, but sometimes in two or three. Venetian chimneys are usually built of brick, and overlaid with pinkish-white stucco. The big funnel tops shown in the first sketch will be recognised as being commonly shown in the pictures of Carpaccio, Billini, and other great Venetian painters. Perhaps, however, after all, the most picturesque chimney is the one which we sometimes come across on an old country cottage. Without any ornament or "features" whatever, some of these rustic stacks have a beauty and quaintness that is peculiarly their own, and, besides, they seem so suited to their position.

A chimney should not be masked. John Ruskin, in his "Seven Lamps of Architecture," dwells much on the lamp of Truth, and affirms that an object should indicate its own proper and legitimate use. Therefore, a chimney-shaft should not pretend to be a tower or turret. Chimneys may possibly, to many people, seem only a detail—that is, of course, with reference to their artistic treatment; but details are all important, for as "the greater includes the less," so inversely no building can possibly be satisfactory until the *total-ensemble* of the whole be made as perfect as mortal hands can make it.

Perhaps, in the dim and distant future, chimneys may be looked upon as the relics of a barbarous age, before electricity took the place of steam as the leading motive power, and chimney pots may only be seen in museums, where our posterity may observe them with as much curiosity as even we now exhibit to gaze upon an Egyptian mummy.

The fort at Coomassie is being built of granite found in the ruins of the King's palace, and of bricks made on the spot. It will be stronger than anything in the interior of West Africa.

Menelik, of Abyssinia, is going to treat himself to a new throne of sculptured oak with gold incrustations, which is being made for him in Paris, from which capital he has likewise ordered *nouveautés* in the shape of silken embroideries, and other objects of decorative art.

CHURCHES AND CHAPELS: THEIR DIFFERENCES OF OBJECT AND CONSTRUCTION.*

BY THE REV. OSWALD J. REICHEL, M.A., F.S.A.

THE difference here intended between churches and chapels is the difference between parochial and non-parochial places of worship, which hence has to do with the parochial system and its needs. Discussing the origin and use of the term "church," it is used but only in a secondary sense of a building. The primary meaning of "ecclesia," in pre-Christian times, is an assembly of the citizens duly summoned by the crier. As a matter of fact, Christians are not known to have had any special buildings for worship before the third century. Lampridius relates that in the time of Alexander Severus (A.D. 222-235) the Christians had erected a building for religious purposes on a waste piece of ground at Rome. Eusebius, the historian, speaking of the earliest Christian building which existed in Antioch, in 270 A.D., calls it "the House of the Church." The same authority states that about 285 A.D. Christians had erected spacious church buildings from the foundations in all cities, and that these were destroyed in the Diocletian persecution. He also refers to "houses of prayer," a "basilica" or Royal hall—a word used by our own Council of Chelsea in 816 A.D. Basilica, indeed, appears to have been the word most frequently used to express the fabric of a bishop's See or collegiate church. For those less than cathedral or collegiate churches there were many names. In Rome, "titles"; in the East, prophets' houses, martyrs' houses, Apostles' houses. In the West, the common name for lesser buildings, and one which was applied to all churches of private foundations, was oratory or prayer house. Cnuts law, in 1017 A.D., refers to a head church, a middling church, a lesser church that hath a burial ground, and a country church.

DISTINCTION BETWEEN PUBLIC CHURCHES AND PRIVATE CHURCHES.

Previous to the tenth century, there were, perhaps, no public buildings for religious worship which were not presided over by a staff of clergy—a college of presbyters and deacons where the services of religion were solemnly and regularly performed—and the discipline of the Church was publicly administered by competent officials. The "head churches" we shall style cathedrals, and the "middling" collegiate or prebendal churches; the "lesser" we would call chantries or chantry chapels, and the "country churches" private oratories. Mabillon relates that at Rome, in the ninth century, there were churches of four kinds, viz.: Patriarchal, Titular, Diocesan, and Oratories, or Cemeteries. Of

PATRIARCHAL CHURCHES,

there were five principal ones, viz.: The Latheran, the Vatican, St. Maria Maggiore, St. Paul without the walls, and St. Lawrence without the walls, besides three others of lesser rank, viz.: St. Croce, St. Agnese, and St. Maria dei Martiri. The twenty-eight titular churches were those to which certain priests and their attendants had not been attached. The diaconal churches were hospitals and poor houses in which service was performed; oratories and cemetery chapels were private structures, in which no regular provision of service was made by the Church. Proceeding to describe the evolution of the building: The house of a well-to-do Roman citizen in classical times consisted of an open courtyard, entered from the street, with a fountain in the centre and a covered portico running all round. At the far end the portico opened into a large hall—the basilica, properly so called—corresponding to the great hall of the mediæval English house. Adjoining it was a bath chamber, and around it numerous rooms of all

sorts. Such a house readily lent itself for Christian purposes. The open courtyard became the atrium, where gathered the penitents and hearers, such as still exists in the Church of San Clemente, at Rome; the fountain became the stoup, used to wash off all defilement before entering the large hall; the hall became the Christian basilica, the bath chamber the baptistry, and the various rooms served as a residence for the bishop and clergy, places for vestments and storerooms, for offerings and gifts, the school, the library, and the scriptorium or writing-room. The large hall was dignified into the name of the Lord's House. The arrangement of the great hall before the tenth century was usually oblong in shape, and constructed to face the East, because the East is a reminder of Christ, the True Light who brings back the day. It was divided into two sections, one for the clergy, called the presbytery or tribunal, or altar-place, the other called the body of the church, for the people. In the apsidal end of the presbytery, on a raised semi-circular dais facing the people, stood seats for the presbyters; in the centre, on a higher level, the bishop's stool. In the chord of the apse, between the seats of the presbyters and the platform, called the solium, stood the altar, separated from the rest of the building by a lattice-work screen or cancelli, the iconostasis of the Greek Church, the original mediæval rood-screen. Behind the screen were curtains, closed during Lent altogether, and at other seasons during the time of oblation. Some churches, however, were round, others octagonal, or in the form of a cross. Although there were cases of the altar being in other positions, orientation other than East was very unusual. In front of the solium rose another platform under the dome, which served as a footpace for the ambon, pulpit, or reading-desk, and on this platform the singers were located. In the

CRUCIFORM CHURCHES,

built after the tenth century, the reader and singers were placed with the other clergy in the part which forms the head of the cross, the screen being brought forward to accommodate them. This additional space was called the choir or chancel, and the tie beam, which could now be introduced into the building without spoiling the effect, was utilized to place on or suspend from it a cross, whence it was called the rood-beam. Behind it a gallery was usually constructed to serve the same purpose as the earlier platform and ambon, and from this gallery or rood-loft the epistle and gospel was read. The other section of the church was also divided into two parts, one called the body of the church, and the other the vestibule or ante-chapel, but generally the ferule or fennel rod, because discipline was there administered with a fennel rod. The vestibule was entered by the great or

principal door, but in the wall which separated the vestibule from the nave were three doors, the central one being termed the Royal door, because it opened into the Royal hall. The door which admitted from the solium to the presbytery was called the Holy door. None was admitted to the body of the church except the faithful, separate portions being set aside for men and women, for matrons and maidens, for monks and seculars. The vestibule was open to heathens, heretics, hearers, and penitents, but not to those under greater excommunication. The baptistry was originally distinct from the central hall, and consists of two parts; (1) the vestibule in which the renunciations were made, and (2) the place of the immersing basin. There were usually two vesting rooms, the larger one being the treasury, in which the vestments, vessels, and property of the church were kept, the smaller one serving for vesting. In contrast with these public churches were private prayer places—the chosen places of assembling in time of persecution, and which were the sleeping places of the dead—some called prophetries, others apostelries, others martyries. But although the object of these cemetery chapels—whether excavated in the rock underground or above ground—was private prayer and private offerings in commemoration of individual saints departed, yet in times of persecution they were often used for public services; and when persecution ended, continued to be so used. The buildings over some of them developed into great basilicas, notably the Church of the Holy Sepulchre at Jerusalem, that of the Apostles at Constantinople, and those erected by Carstantine near the oak at Mamre and at Heliopolis in Phœnicia. When Christianity was first introduced among the Saxons of this country it came as a missionary church. Canterbury, Rochester, London, and Winchester in succession to Dorchester and York, probably exhaust the list of public churches under a bishop for the first fifty years. Glastonbury, Westminster, Lindisfarne, and a few other monastic churches the list of public churches under an abbot. The earlier fabrics were no doubt of a very humble description. Baeda, writing in 730 A.D., describes one as being square. Aleuin, some sixty years later, also speaks of a square

temple. Baeda relates that Paulinus, 627 A.D., built a timber church at York, and that Finan built a church in the Isle of Lindisfarne of cleft oak, and covered it with reeds. Eadbert, bishop of that place, afterwards took off the thatch and covered it with plates of lead. It is true that here and there stone churches are heard of before the Conquest, chiefly in the south of England. For instance, Baeda mentions a stone church at Lincoln before 730 A.D., and states that King Edwin built a stone church at York in substitution for the wooden one which he had first erected. But they were in towns, and the same writer alleges that stone churches were unusual in England. Churches when not constructed of wood were most probably of wattle and dab in the East country, after the fashion of the existing church at Greenwood in Essex, or in this county (Devon) of cob, covered with thatch. It seems, however, probable that until within a century before the Conquest very few, except public churches, consisted of more than an altar with a shed over it to protect the officiating presbyter from stress of weather, or, indeed, of more than a cross erected on some open piece of ground. Writing in or about 750 A.D., the

Abbess Walpurga stated:—"It is the custom of the Saxon race that on many of the estates of nobles and of good men they are wont to have not a church, but the standard of the Holy Cross dedicated to our Lord, and revered with great honour, lifted up on high so as to be convenient for the frequency of daily prayer." This statement receives confirmation from Baeda. About a century, however, before the Conquest, there must have been a certain number of private churches, or, at least, of private chaplains ordained for conducting services regularly at particular places, who claimed in consequence to be entitled to receive the people's tithes and offerings. This is manifest from the 2nd of King Edgar's Ecclesiastical Laws in the year 958 A.D., and this was the first step to what afterwards became the parochial system.

PAROCHIAL CHURCHES.

The parochial system introduced a new kind of church and a new kind of service, churches which were private or oratories in the foundation, but were allowed some of the rights of public churches, and had a form of service which was neither a solemn service conducted by many clergy, nor yet a private service conducted by a single priest. The parish was the manor or group of manors under its ecclesiastical aspect. The origin of the parochial system is therefore contemporary with the origin of the manorial system, but although it may have existed earlier in France, in this country its beginnings date from the Norman Conquest; the system was not, however, complete before the 13th century. The Norman Conquerors of this country, although rough and ready in manners, were pious and devout in heart, and they altered things greatly to the advantage of the Church. Frequently a Norman churchman was placed at the head of the ancient minsters as Abbot, and the estates of the religious house were conferred upon him to hold by baronial tenure. Over and above this the more religious among them began to pay tithes on their newly-won estates as their ancestors had paid before them in Normandy. These tithes they sometimes bestowed on an ancient minster, but quite as frequently they gave them to the priests whom they appointed as chaplains for newly-erected

churches on their own estates. Gradually the ties were broken down which connected the villages with the ancient minsters; the newly-built village church, with its monasterium or glebe-house, became a centre of religious life, but not of discipline, save of the inner forum, and the village service ceased to be a private service, celebrated by a travelling missionary from the bishop without becoming a solemn one.

INTERMEDIATE CHARACTER OF PAROCHIAL CHURCHES.

The village church is not intended for solemn worship like a cathedral or minster, therefore, the presbytery and apse, and a detached altar standing in the chord of the apse, are not required. In it the priest is simply the public leader of the people's worship. He takes his place at their head like one of themselves, for as Micrologus says, the people are necessary to him to make up the two or three without whom there can be no public or corporate worship. The most suitable place for the altar, therefore, is against the east wall. As solemn services died out in ancient minsters, which appears to have been the case at the beginning of the thirteenth century, a straight wall was erected, even in these, against the east side of the altar; the bishops seat was removed in consequence from the east end to a place in the choir, and the presbytery converted into an ambulatory or enlarged to form a lady chapel. The village church being without a presbytery, the seats for the clergy—often one, never more than three—were placed on the south side of the altar. Owing to the same reason—the absence of solemn worship—the choir or chancel of a village church is usually found of small dimensions, and in most cases incapable of accommodating a choir, notwithstanding the modern practice of placing these. It seems, indeed, impossible that a choir could even have occupied the chancel, if any attempt were made, as no doubt it would be on great days, to celebrate the service with any degree of solemnity. A certain amount of space would be necessary for the deacon and sub-deacon to pass to and fro to the rood loft. Had a choir in the chancel been contemplated, we may be sure the chancels would have been constructed much wider than they are usually found. This view is strikingly confirmed by some of the latest pronouncements of the society of St. Osmund, who considered the west gallery the most suitable place for the choir. In a collegiate church the singers formed a semi-clerical order, who were instructed and brought up in the house of the church. In the village church there was no order of singers. The only other clerk besides the priest was the collet or parish clerk, without whose assistance both the third and fourth Lateran councils forbid any priest to offer the Eucharist. We may even go so far as to say that the existence of the nave at all in the village church appears to have been really an

afterthought. For the Saxons, as they held their shire-moats and hall-motes in the open, so, too, they themselves prayed in the open. It seems not improbable that small prayer cells, those parts of a village church, in fact, which we now call chancels, were the original buildings constructed in a number of places by

THE ANCIENT MINSTERS,

both episcopal and monastic, which took upon themselves the task of sending clergy round to minister to the people. First the clergy had ministered under the shadow of the village-cross, next they erected a small cell to protect the altar, at which they ministered when they came round, and from its entrance they read the epistle and gospel, and preached to the people who stood without in the open. The bishops' minsters and the monastic minsters built these prayer cells, and so they and their successors in title continued to maintain them; the practice has still survived even in our own day. In some cases village churches were built where no prayer cell existed before, and this probably explains the rarer cases where by custom neither rector nor incumbent repairs the chancel. In a climate like ours attending a service in the open must have been at certain seasons fairly trying, hence in Norman times the manorial lord and his yeomen constructed for their own use a nave adjoining the chancel, practically a separate structure, and maintained it until the church rates abolition, at their own separate charges. The chancel and the nave, however, appear to have always been looked upon as two separate buildings. They were entered by separate doors, and the obligation to repair them fell upon different parties. We may therefore conclude that there is no rule for the size and appointments of the nave of a village church save the number of persons to be provided for, and the funds available for the purpose. Of old, the ancient minsters, and only the ancient minsters, were supplied with baptistries, for only at these was there an adequate staff of clergy to prepare adults for baptism. To this day only one church in Florence—El Duomo, the domus or house of the church—has a baptism. All lesser churches are and were supplied with fonts for the baptism in infancy of the children of Christian parents—not for adults. In this country it is doubtful whether village churches, except, perhaps, in a few instances, had fonts before the constitutions of Langton in 1223. As to chapels which exist for the ease and convenience of parishioners who are unable to attend their parish church, or else for the commemoration of the dead, little need be said. Their object being purely private, there is no reason why they should assume one form rather than another, except to serve the purpose for which they were intended. It seems, however, hardly reasonable that they should always be built on the lines of a parish church, unless they are built as district churches, and there is a prospect of the district being erected into a distinct parish. Perhaps such buildings afford the best opportunity for the architect to strike out some new line of his own.

To sum up briefly:—

1. There is, and always has been, in the use of the term church—applied to buildings—a broad distinction between public churches and private churches.

2. Public churches or ancient minsters are those provided with a staff of clergy capable of handing down tradition and exercising public discipline. Private churches are praying places for the living, or places for commemorating the dead.

3. Intermediate between public churches and private churches are the village churches, the majority of which were originally private chapels served by itinerant clergy, but were constituted in a certain sense public churches, and endowed with tithes and lands as such by the Norman conquerors between the eleventh and thirteenth centuries in this country.

4. The intermediate character of a village church is, therefore, represented in its Architecture.

(1) Instead of a presbytery, apse, and detached altar, the altar is fixed against the north wall, and seats for one, or at most three clergy, are placed on the south side. This construction of a village church has reacted on the construction of the cathedrals.

(2) There being no body of clerical singers, the chancel is small, and the singers—not a semi-clerical body here, but a mixed body—are placed in some other part of the church. The west gallery, according to the Society of St. Osmund, seems to have been chosen for this purpose.

(3) The shadow of the cross was the earliest oratory among the Saxons. It was succeeded by the prayer cell of modest dimensions, usually constructed and maintained by one of the greater churches. When the prayer cell became a church, the body of the church was added by the people for their own use, and by the people it has ever since been maintained until the Church Rates Abolition Act was passed.

(4) Village churches, being only public churches for certain purposes, are required to have stone fonts for the baptism of children. Baptistries for the baptism of adults belong to collegiate churches, otherwise called baptismal churches.

(5) In constructing chapels, it is desirable to consider their ultimate destination, and to construct accordingly.

THE Works Committee of the Paddington Vestry has approved amended plans for the erection of a theatre on the site of Nos. 212 to 220, Harrow Road. Having regard to the associations of Mrs. Sarah Siddons with Paddington, it is suggested that the new playhouse should be named "The Siddons Theatre."

It is understood that the Lords Commissioners of the Admiralty have accepted the tender of Messrs. S. Pearson and Son, Limited, 10, Victoria Street, Westminster, London, S.W., for carrying out the Dover Harbour works, which are estimated to involve an expenditure of three and a half millions sterling, and to occupy about eight years in construction.

A NEW SCOTTISH ARCHITECTURAL ASSOCIATION.

SOME SUGGESTIONS FOR STUDENTS.

PERTH now has its Architectural Association. Mr. G. P. K. Young, A.R.I.B.A., is the president, and was in the chair at the inaugural meeting, an opening address at which was delivered by Mr. Hippolyte Blanc, R.S.A., Edinburgh. Before introducing the lecturer, the Chairman thought it better that on this occasion—the first public meeting of this Association—he should explain, in a few words, the purpose for which it had been formed. It had been originated and formed entirely by the young men in the district who were interested and actively engaged in the study of Architecture and engineering. With a view to carry out their desire of improving their knowledge in these subjects they had combined together to obtain better facilities of study. The means they proposed to adopt were, first of all, working classes, in which certain subjects would be given out for study and discussion under the guidance, it was to be hoped, of one or two of the practising architects in the city, who would assist by discussion and otherwise. The Society also proposed to give a few lectures during the season on special subjects, a course of interest to architects, and of information to the general public. It also aimed at trying to increase Architectural knowledge and

POPULARISE THE STUDY OF ARCHITECTURE

in the city. The working class had already been formed, and the attendance was good, and the enthusiasm displayed most gratifying. They hoped, by the end of the session, to hold an exhibition of the work the students had done, an exhibition which, he was sure, would be interesting to everyone.—Mr. Hippolyte Blanc said he had assented to the request to be present because he was glad of the opportunity it gave him to offer his congratulations on what he viewed as an important and valuable step on the part of local practitioners. Such a step as this was a recognition among them of the dignity of their Profession, of its claims, and of the responsibility attaching to those entering its ranks. He ventured to predict for them a share of the luck which had attended ventures in this the great year of the Jubilee. He wished them success, for the sake of those launching the Association, as well as for those who might arise to attach themselves to it. Without presumption he felt constrained to add that he was sure theirs would be cordially welcomed as an addition to the group of similar associations. There could be no doubt that the banding together of members of the same profession tended to the maintenance of professional etiquette. Yet he would remind them that with all the advantages accruing to such associations, their influence for good was weakened unless

"CHIMNEYS." SKETCHED BY C. W. T. TOMLINSON.

there was a recognised freemasonry, a fraternal and confident co-operation among its members. He wished to lay before them, as a young Society, a few thoughts upon the interests of their Profession, and indicate how best they could aid in promoting these. The past was that out of which the future grew, and any effort towards progress which did not recognise the value of that past was unreliable. He desired to impress upon them that the enthusiasm of their beginning should be maintained, as much as possible, throughout their Association; and that as life progresses the Association should be proved perennial, by a constant springing up of new actors as the old actors subsided in the restfulness of autumnal repose. Such an Association as this should be raised upon the concrete of a fraternal communion with a

SUPERSTRUCTURE OF UNAFFECTED LOVE
for the Profession. Love was their keynote. Another requisite was devoted study towards knowledge, but it must be patient, persistent, and consistent. All knowledge acquired would never make an artist, but it would at least prevent the errors and anachronisms which betrayed the untutored hand. To Ruskin's mind there were two qualities which distinguished great artists—imagination and industry. Imagination was a high gift, though it could not be boasted that many artists possessed it. But industry had promised to it great rewards, and its exercise was within the power of all. What concerned them in this Association was the manner in which it could be made helpful, primarily to young members of the architectural Profession, and also the public who interested themselves in Art matters. There was knowledge which would not be useful to the architect, but it was not intended that an architect should be expert in all. He should, however, have such experience of all branches that in the interests of the public he, calling himself an architect, should prove himself competent to design a building that would at least be sound in construction and healthful without extravagant waste of material. Architecture was a definite Art, much more so than her sister arts of painting and sculpture. It was in the decoration of the forms of the building that the Art was expressible. How were all the requirements to be most readily attained by the student? The only way was, first, by a course of well-directed study, and second, by concurrent office practice during a specified number of years. He recommended five years at least. Mr. Blanc then reviewed the system of teaching on the Continent. Looking at home they found an absence of anything like State aid, and the burden was, in consequence, laid upon communities to establish, either by private enterprise or congregated effort, the necessary ateliers and larger schools, where such instruction as was required by the architectural student might be obtained. The actual defeat of their system was the too great ease with which one could enter the Profession, take three or four years at very mechanical work in an architect's office, and, without special study of any kind, commence the commercial pursuits of an architect. With all the machinery in schools of art for training students, there was still an important requisite wanting. There should be

SOME FORM OF TEST

at the close of a youth's ordinary school education, from the result of which a direction might be given him as to that labour of life for which he indicated most fitness. An Association of this kind should exist primarily for instruction. It should be a nursery and training room for all entering the Profession. Dealing with what should be their objects of study, he said the best subjects were to be found in the past. These designs, however, should be studied, and not merely copied. Lectures, &c., should be systematically pursued; and every encouragement should be given to outside measuring and sketching. In this connection they should make the camera their friend. The student, also, must not overlook his opportunities in gaining office practice. The great difference between the British system and that pursued on the Continent, was that instead of being too academic they

joined the practical with the academic. His care in the office should be to welcome a good draughtsman. In his early years of office work he should jealously guard himself against slovenliness. In Architecture there should be a balance of light and shade, as much as in the work of the sculptor or the painter. An architect's best help towards a satisfactory design was his first carefully finished drawing. He strongly advocated a careful study of perspective. Concluding, he gave advice as to examinations, and recommended them as a matter of discipline if on no other grounds.—Mr. David Smart, architect, proposed a vote of thanks to Mr. Blanc.—Rector Chambers seconded. Mr. Blanc, he said, had uttered throughout his discourse wise sentiments which might well be applied to other arts and studies, and not merely to Architecture.—Mr. Blanc, in thanking the meeting for the compliment paid him, dwelt on the advisability of instituting a library in connection with the Association. He thought this suggestion would be far better expressed in action than in words, and he therefore took the opportunity of presenting them with Volumes I. and II. of the "Edinburgh Sketchbook," as an offering from himself for the beginning of what he hoped would be a very interesting collection.

AN OLD CITY TAVERN.

THE Blue Last, in the Broadway, Ludgate Hill, which shares with one other house in the City the distinction of bearing that sign in London, is a tavern of considerable historical importance, and, if the ground upon which it actually stands cannot claim any particular interest, the building is in the very midst of land every inch of which is eloquent of the dead past. Just without the City wall, which ran close by, stood the first Blue Last, in immediate proximity to the site of a small barbican or watch tower, protecting Lud Gate, which was only destroyed in 1760. This gate stood between the old London Coffee House, which was pulled down about forty years ago, and the church of St. Martin. In the year 1792 some workmen uncovered the remains of the small barbican which protected the gate, and shortly afterwards another defensive work was found in a line with the Old Bailey. The City wall—the last remnants of which, in this part of London, were only destroyed a few years ago for the widening of St. Martin's Court—had its south-western angle hard by Ludgate, and almost exactly on this spot the Blue Last now stands. The house is situated within the parish of St. Ann, and at scarcely a stone's throw from the site of the great monastery of the Dominicans or Black Friars. Once again it has been

IN THE HANDS OF THE BUILDERS

for extensions and alterations of considerable magnitude. The object of the extension was to increase the convenience of the house, and the great difficulty encountered by the architect was to remove practically the whole of the interior construction and fittings from the older portion in a very limited time and space, without closing or materially interfering with the continuous occupation of that portion. This has, however, been most successfully accomplished. Speaking generally, as to the construction and architectural features, it may be said that externally it was sought to make the new part accord and harmonise with the old, and internally to alter and renovate the old to match the new. The ceilings of the bar are decorated with "Salamander" asbestos plaster, which produces a very pleasing effect, whilst the walls are lined with light-coloured tiles. The new staircase is of Stuart's granolithic concrete, with wrought-iron balustrade and grilles, and the lobbies, as well as principal landing, are paved with mosaic. The walls of the smoking-room have been hung with Lincrusta, and subsequently decorated. The whole of the works have been carried out from the designs and under the superintendence of Messrs. G. Elkington and Son, of 95, Cannon Street; whilst Mr. James Carmichael, of Wandsworth, was the building contractor.

THE WOES OF THE BUILDER.

LABOUR MOVEMENT IN BIRMINGHAM.

WITHIN the past few days the Birmingham master builders have received intimation of a movement affecting wages, working hours, and working conditions on a scale altogether unprecedented in the trade. The application emanates from the Building Trades Federation, which comprises all those engaged in the building trades, with the single exception of the bricklayers, and advances are asked for no fewer than seven separate classes of workmen. The following circular has been posted to the Associated Master Builders by the secretary:—"I beg to advise you that notices have been received for important alterations of rules, reduction of working hours, and advances in wages as specified below, namely:—

Carpenters from ...	9d. to 10d. per hour.
Plasterers ...	9d. to 10d. "
Masons ...	9d. to 10d. "
Mason Fixers ...	9½d. to 10½d. "
Plumbers ...	9d. to 10d. "
Labourers (both societies) ...	6d. to 6½d. "
All scaffolders ...	6½d. to 7d. "

No notice has been received from the Bricklayers' Society. The mill sawyers ask to have rules with this society." We understand that the applications will probably be considered at the annual meeting of the Birmingham Master Builders' Association, which is fixed to take place at the Grand Hotel tomorrow, 25th inst. The claim has caused some astonishment among the master builders, some of whom state that, with an experience of fifty years, they have never known wages to ascend more than a halfpenny per hour at a time. On this occasion it will be observed five of the seven classes, practically comprising all the skilled workmen, ask for one penny. Such a concession would raise the wage rate to a standard never before realised. It would

INCREASE THE COST OF LARGE CONTRACTS

by thousands of pounds, while it would place great difficulties in the way of erection of small property. There is, no doubt, a very important item in the programme—a general eight hour movement. Hours vary in the building trade with the seasons, but the general result of the reduction, which brings the working day in winter to slightly under the eight hours day, and in summer to slightly over, will be to yield an average of eight hours per day. Prominent workmen, while admitting the entirely unprecedented character of the demand, point out that such a trade as that at present existing has never been known in Birmingham. In the carpenters' society, for instance, which comprises 2000 members, there is not a single society man out of work. This is probably true also of non-society men, but these now form so small a proportion of the whole that their organised fellow-workmen consider they may safely be left out of account in the matter. Next spring will probably see something like a boom in the building trade, and workmen will be at a premium. Under those circumstances, the men consider they will be to blame if they do not make hay while the sun shines. Several thousand workmen in Birmingham and the neighbourhood will be affected by the movement, which is undoubtedly the largest undertaken in any industry for several years past. The one element of the situation from which the employers derive comfort is that the proposed changes cannot take effect until April next, in accordance with an agreement arrived at six months ago. Six months notice must be given of any proposed change, and in the meantime the matter must come before the Board of Conciliation, which has power to settle all matters in dispute, and its decision is binding upon all parties. Obviously such an arrangement is necessary in the interests of the building trade, in view of the large contracts undertaken. The men are waiting with a good deal of interest the reply of the employers which should be to hand by December 1st. Any decision of the Board affecting wages must be arrived at by the Board not later than March 25th.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

November 24th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ARTISTICALLY inclined visitors who have been led by unfrequented paths to the Tate Gallery, will probably have been delighted with the groups of red-sailed barges which usually formed a foreground to the huge Victoria Tower, and to the peeps through arched gateways of riverside wharfs, which have called to remembrance the early Thames etchings of Mr. Whistler. If the London County Council is permitted to have its way, all this is to be done away with, and at a considerable cost for compensation for vested interests and construction. Another link in the long, uninteresting stretch of riverside embankment, which will ultimately extend from Hammersmith to London Bridge, will thus be forged. The matter has been referred to the Improvements (!) Committee.

THE Duke of Bedford proposes carrying out an improvement, by demolishing all the old unsanitary houses and stables in Little Guildford Street and Little Coram Street, and widening those streets to the extent of 40ft. throughout the entire length. The St. Pancras Vestry has agreed to pave so much of the land to be yielded to the public as lay within its district, the St. Giles's Board of Works having arrived at a similar decision with regard to the portion of the new street within its area.

WHAT may literally be called an unrivalled opportunity is open to the architects of all countries, designs being invited by the trustees of the University of California. Although this seat of learning only sprang into existence five-and-thirty years ago, it already possesses a capital fund of nearly two millions sterling, while the annual grants of public money amount to some 300,000 dols., and there are in addition the fees of 2300 students. There are practically no restrictions upon the freedom of the competitors, either as to the treatment of the building or even its cost.

ONE of the most notable street improvements undertaken of late in London is the demolition of the block of shops in front of the Hôtel Cecil, in the Strand. The site upon which these buildings stand will be utilized for the addition to the hotel of a new wing, with an arched entrance into the Strand. This will be an imposing structure, and will give a new air of dignity to a street which at present is not remarkable for its architectural features. But a more important result will be the widening of the roadway by 13ft. The line of frontage adopted will be enforced in the case of all new buildings on the same side of the street, so that it is only a question of time for the Strand to become throughout a fine, broad thoroughfare from end to end.

AMONG other items of news from Paris it is announced that the Société Nationale des Beaux Arts, which has since 1890 controlled the Salon du Champ de Mars, has decided to build a gallery in which to hold its annual exhibitions. A site in a busy quarter of the city has been secured, and the building is to be

completed in six months' time, so as to be ready for the spring show of 1898. This decision seems to imply permanent separation on the part of the new society from the Old Salon, and apparently puts a stop to the hope of ultimate reunion between the old society and the new, which has been entertained in French artistic circles ever since the original schism. In such an Art centre as Paris there is, however, ample room for two exhibitions of real importance.

An important series of tests on the durability of paints on metallic structures which are continuously exposed to the weather and coal gases, is now being made in New York by instruction of the Department of Public Works. An account of the time required for coating, the chemical analysis of the pigments, and other data connected with the work, is being carefully kept by the engineers of the Department.

THE death is announced of Mr. John Bagnold Burgess, of the Royal Academy, in his sixty-eighth year. His father was landscape painter to William IV., and for generations the family had been artists, his great-grandfather having given lessons to Gainsborough. He was educated at Brompton Grammar School. Thence he migrated to Mr. Leigh's studio, and had among his fellow-pupils Edwin Long and Philip Calderon. At an early age he carried off the first medal awarded by the Academy for drawings from the life, and shortly afterwards commenced to paint portraits. It is nearly thirty-five years ago since his first Spanish picture, "Bravo Toro!" divided attention with Frith's "Royal Marriage." From 1865, each year found Mr. Burgess in Spain, occasionally crossing the Mediterranean to depict some African scene, but, as a rule, he rested content with the churches, priests, nobles, gipsies, beggars, beauties, picadors, and matadors of Seville.

A VERY amusing instance of the way in which museums are imposed upon has just come to light. At the French Revolution, when the Cathedral of St. Denis was so mutilated, the figures which ornamented the beautiful Gothic tomb of Dagobert were thrown down and for the most part destroyed, all that remained being the body of his Queen Nantilde and the head of his son Clovis. When the restorers stepped in, subsequently, they made the best they could of the bits, putting the son's head on the mother's body and calling it the Reine Nantilde. Not very long ago more intelligent restorers put an end to this absurdity, and there are now to be seen at St. Denis two statues, on which the original portions of each are preserved. But meanwhile casts of the hybrid were taken, and they still exist in the collection of the Beaux Arts, at Paris, and in the National Bavarian Museum, at Munich, as examples to students of all that is best in Gothic Art. But this is not all. In the Great Museum at Berlin, in the sculpture department, there is a small statuette of stone, with various cracks and flaws, which give it an antique appearance, which is nothing less than a smaller and very imprudently made counterfeit of the hybrid. The forger felt the difficulty which might be raised to placing a man's head above a woman's bust, and so has modified both to a small extent; but there is not a shadow of doubt that he has succeeded in palming off a most unexpected imposition where he could little expect to.

THE increasing use of iron and steel for building purposes, says a German contemporary, makes the question of the action of lime and cement on them of some interest. Wrought-iron bedded in freshly-prepared lime is acted upon to a considerable extent; cast-iron is not so much. The action consists of a profuse rusting which extends inward; moreover, the untouched iron core seems to have its physical properties changed, becoming brittle and weaker. Another danger seems to be caused by the remarkable expansion in volume which goes hand in hand with the deterioration of iron while rusting, considerable force being exerted as a consequence; as,

indeed, it has been noticed that huge blocks of stone which had been connected by iron clamps set in lime mortar were thrust asunder and had to be rebbed. Plaster-of-Paris has a similar action on iron, though not so marked; while cement, on the contrary, seems to be an excellent protection to iron. Even under water cement prevents deterioration of iron to a great extent, and it is therefore recommended where there is any liability of moisture to be present.

MR. J. HARTREE, of Hereford, as a preliminary to the course of Oxford University Extension Lectures on Gothic Architecture, to be held in January, recently gave a lecture on "The Architecture of Ledbury Church." The lecturer, after giving a history of parish churches in general, tracing them from the Basilicas of 300 A.D., and having touched upon the various developments; made necessary by the use of a choir, &c., which tended to alter the shape of churches, also the usual ways in which they were enlarged, went on to deal with Ledbury Church, the oldest portion of which, he said, were the Norman arches in the chancel, which were part of the chancel arcade—1060 or 1070. The lecturer also spoke of the detached tower, remarking that in Herefordshire detached towers were more usual than in other counties.

THE Red Cow, one of the last remaining of the old coaching inns in the neighbourhood of London, is being demolished. The old house was of so fragile and slight a character that its destruction has offered few obstacles. Situate at Hammersmith, at the corner of St. Paul's Schools, it was probably the oldest house in that western suburb, and, being on the old Bath and Exeter roads, was a busy place in coaching times, the more especially since it was then at the end of the first stage out of London, and the inn at which the horses were changed. When the last coach was taken off the road the character of the inn changed. It was a favourite "pull up" for the carters bringing hay and garden produce to the London markets, and on certain mornings, with hay-wains standing in front, and the horses drinking from the kerbstone trough, it was picturesque enough, and resembled nothing so much as a picture by Morland come to life.

THERE is on exhibition in the Egyptian Galleries of the British Museum a very interesting statue of one of the kings of the Ptolemaic period. This statue, which is one of a number of recent additions, shows a very strong Greek influence, not only in the features, but also in the general outline of the whole. The legs are much damaged, and the feet are entirely wanting. The king is represented wearing the usual short apron fastened round the waist, and the head is covered by the familiar wig, ornamented with the Uraeus, or sacred serpent. There is no inscription to show what particular king it is supposed to represent, but its late date is well shown by the method of carving, as well as by the features, which are certainly not Egyptian.

THE Port of Antwerp has undergone successive improvements as her shipping interests have augmented. In 1886 the dock and quay accommodation was largely increased and brought up to the modern standard. Since that date, however, no further improvements have been made, and Antwerp is now finding its resources quite inadequate to the calls made upon them. Consequently, the Belgian Government has decided on a large extension of the Antwerp quay and dock accommodation. This extension is to consist: (1) In an addition 2000 metres in length to the existing quays in the southern or upper part of the port, where it is hoped, by means of a bar, to establish a permanent navigable channel accessible at all states of the tide; and (2) In the rectification of the course of the Scheldt by a new "cut," extending from a bend of the river some miles below Antwerp to a point of junction with the present river front. This new cut is to be some 8000 metres—close upon five miles—in length, and, if successfully accomplished, will

offer almost unlimited space for expansion on the right bank of the Scheldt below the town. The project is a somewhat daring one, as the courses of river currents are notoriously dangerous to interfere with, and any stoppage, even of a temporary character, of navigation on the Scheldt, from silting up or other causes, would prove disastrous to the interests of Antwerp. The most eminent hydrographical engineers are, however, in favour of the scheme, and there can be no doubt that if it be brought to a happy issue it will not only be an engineering triumph of no mean order but will open a new era of prosperity for the Port of Antwerp.

It is stated that specifications have been prepared on behalf of the Post Office authorities, and will shortly be issued, for the erection of a power station in connection with the G.P.O. A site has been acquired by buying premises from Messrs. Lalouette and others, immediately adjoining the G.P.O. in Princes Street, and here a station is to be erected, to be furnished with engines to create power for working the pneumatic system of transmitting telegrams, as well as lighting the Post Office and the Returned Letter Office in Upper O'Connell Street.

THE Union Centrale des Arts Decoratifs is to be given an opportunity to try and form a collection of examples of the applied Arts, on the same lines as that which is administered by the Science and Art Department at South Kensington. At the Louvre, too, an attempt is to be made to rival the collection of casts which is one of the most valuable features of the South Kensington Museum, and a large gallery, containing reproductions of the best antiques, is to be opened in the next few days.

THAT renowned hostelry the Greyhound, in Dulwich village, has reached its last days. For more than a year its doom has been pronounced, but now there is little time left, for such as may wish to renew their acquaintance with the old house and grounds, before the whole place is demolished, to make room for a new road of genteel villas. Dulwich has up to the present retained in a great measure its rural simplicity, and is still one of the sweetest spots of Greater London. These happy times are, however, nearer every year to their end, for leases of the many cottages and pleasant old houses are falling in, not to be renewed, and all too soon must come the end of Dulwich village. The Greyhound—last remaining of the old inns of Dulwich—is a substantial, many-windowed house standing back from the roadway, with trees and shrubs in front. In the dim and distant past there was a Green Man on the same site, and in the middle of the 18th century the Greyhound came into existence.

THE Council of Rome has secured the celebrated Villa Borghese. The finances, both of the Government and the municipality, seemed in so precarious a position that it was looked upon as very probable that the city might be for ever spoiled by the property passing into the hands of the speculative builder. The princely family of the Borghese has fallen upon such evil times that the place was going to rack and ruin. They will now receive an annuity of £6000 a year in consideration of the concession.

MR. J. A. F. ASPINALL, chief mechanical engineer to the Lancashire and Yorkshire Railway Company, has succeeded Sir A. R. Binnie as president of the Institution of Junior Engineers, and in his new capacity occupied the chair at the opening meeting of the season, the other evening, at the Westminster Palace Hotel. His address dealt chiefly with the wear and tear of materials, and he made many interesting statements as to the "life" of the different parts of a locomotive. Incidentally, too, he showed that we are becoming more and more dependent upon either our colonies or foreign countries for timber with which to construct the under frames of railway carriages and wagons. The difficulty of obtaining the best English oak for this purpose is growing greater every day, and Mr. Aspinall expressed

surprise that we should have so long delayed in following the example of many Continental railway companies, which use rolled steel or iron for under frames. The possibility of the steam locomotive being superseded by electric traction was also considered. Mr. Aspinall did not suggest that electrical working was not possible, but he was of opinion that they had not yet solved the problem of moving heavy loads at high speeds by means of electricity with sufficient economy to warrant the immediate replacement of steam locomotives with electric plant.

THE Commission of Sewers, at a meeting on Tuesday, Nov. 16th, considered a report of the Finance and Improvement Committee relative to the improvement of Lower Thames Street. The length of the street now proposed to be widened was about 315ft., and a plan and estimates prepared by the engineer, for making the same 40ft., 50ft., and 60ft. wide, at a cost of £151,500, £171,100, and £199,000 respectively, was submitted. The Committee was of opinion that the existing accommodation was inadequate to the requirements of the neighbourhood, and that it was desirable to widen Lower Thames Street between Botolph Lane and Fish Street Hill. It, however, recommended that the plan and estimates for making the portion of Lower Thames Street 40ft., 50ft., and 60ft. wide respectively, should be submitted to the London County Council first of all, and the opinion of the Council invited as to the alternative schemes, with a view to their contributing towards the cost of the one they deemed it most expedient to carry out.—The Commission agreed to this proposal.

At the last meeting of the Surrey County Council particulars of the proposed lock below Richmond were given from the scheme of Mr. E. Pritchard, C.E., the engineer appointed by the local committee. Mr. Pritchard advises the construction of the new works at a point about nine miles below Richmond Lock, and five and a half furlongs below Putney Bridge, near and to the west of the point where the River Wandle enters the Thames. The works are to comprise a steel single footbridge across the Thames, having eight arches, six of 90ft. span, and two of 60ft. span. The bridge would contain six of Stoney's patent moveable sluices (similar in kind to those at the Richmond Lock), each of 90ft. clear span and 14ft. deep, with the necessary machinery for raising and lowering the sluices. The headway of the bridge is to be 22ft. 6in. above Trinity high water mark. The sluices are designed to hold up the water 6ft. above low water of spring tides. The increased depth of water anticipated is at Kew Bridge, 4ft.; at Barnes Bridge, 4ft. 7in.; at Hammersmith Bridge, 5ft.; at Putney Bridge, 5ft. 9in. The estimated cost, with a single footbridge (there being two footbridges at Richmond Lock), is approximately £250,000, and the time required for carrying out the works between three and four years.

THE Isthmian Club has just entered into the occupation of 105, Piccadilly, which was once the residence of the late Sir Julian Goldsmid. It is not the first time that a mansion of its kind has been turned to similar uses. For example, the Naval and Military Club, within a few doors, tenants No. 94, which was erected for the Earls of Egremon, and afterwards known as Cambridge House, the Duke of Cambridge (brother of George III.) having lived in it. Lord Palmerston subsequently held it for ten years, until his death, and it was the scene of Lady Palmerston's brilliant receptions. Next door to the Isthmian Club is the St. James's Club, formerly Coventry House, and for a century the residence of the Earls of Coventry. There is a story, too, that the Turf Club, in Clarges-street, was the house which was built by the Duke of Grafton, who forgot to insert a door, and, therefore, had to buy the adjoining premises, in order to make an entrance. The name originally given to the new headquarters of the Isthmian Club was Hertford House, after the late Marquis of Hertford, who built it about 1850, from the designs of a Polish architect. The eccentric

owner, however, never lived in it, because the parishioners of St. James's refused to allow him to pave the street after a fashion of his own. In it were placed many splendid works of Art, purchased by the Marquis from the late King of Holland, and Lord Ashburnham, with several others from the Saltmarsh collection. The mansion was left to Sir Richard Wallace, who sold it to the Goldsmid family. During Sir Julian's lifetime it was a treasure-house of curiosities, and some fine tapestries adorned the magnificent staircase. The rooms, providing free circulation, were admirably adapted for entertainment of guests in large numbers, and hence, during the Diamond Jubilee, it was rented for a short time by the Right Hon. Joseph Chamberlain. The Isthmians, who are chiefly University and public-school men, are well pleased with the change, their old rooms in the Walsingham House block, which they occupied for ten years, of course bearing no comparison to the magnificent suites they now command. It is interesting to note that, in addition to the St. James's Club, they have for immediate neighbours the Junior Constitutional Club, the Badminton Club, and the Savile Club. From 98 to 107, Piccadilly, inclusive, there is now an unbroken sequence of club houses; and in all there are eleven first-class clubs commanding frontages upon the Green Park, in the one thoroughfare, where years ago, from 1807-19, Wattier's, a "subscription house," at the corner of Bolton Street, was the rather questionable resort of most of the fine gentlemen of Beau Brummell's day.

WITH reference to the paragraph appearing in our "Bricks and Mortar" columns last week, on the subject of the double glazing of windows in the winter, and in which it was stated that the proposal was "made in Germany," Messrs. E. Farrar and Co., of 69, Berners Street, Oxford Street, W., write to the effect that they have adopted the plan on several occasions with excellent results, and at the present moment have some exceptionally large windows in hand with the glazing on this principle.

To escape the charge of vandalism, the Government has named a committee to choose the plan for the future railway terminus on the Quay d'Orsay. It will include MM. Puvis de Chavannes, Bonnat, Lafenestre, Detaille, and Vaudremer, artists who are members of the Institute; M. Sauton, President of the Town Council; M. Lisch, Inspector-General of Historic Monuments, and M. Roujon, Director of Fine Arts, but there are also a number of engineers, architects, senators, and deputies. M. Dupuy is the president of this committee.

MR. E. S. PRIOR is about to write a book on English Gothic. A most interesting problem is the special one with which he proposes to deal: the evolution of an original and characteristic English style from the style which, introduced by the Normans, was for a time common to England and Northern France. Mr. Prior will show the steps by which the two styles became differentiated, and how the English Gothic became an expression of the national mind and feeling. The illustrations, taken from English and French buildings, will be executed by Mr. Gerald Horsley. The work will be published by Messrs. Bell.

Few even of the lovers of Charles Dickens are aware that a portion of the old Marshalsea Prison yet stands hidden away behind the Borough High Street and St. George's Church; but the remaining wards of the prison, which once was the home of Mr. and Mrs. Micawber, when that gentleman's affairs had arrived at a "crisis," are about to disappear. The new scheme, which has been undertaken by the L.C.C., for the continuation of Tabard Street into the High Street, past the east end of St. George's Church, will wipe into oblivion all that is left of the old Marshalsea, though the church, in which Little Dorrit spent the night when she had been "locked out," will stand as a monument of the great novelist's creations. The gateway of the prison, up a court, No. 205, High Street, stood until a few years ago,

and the new warehouse entrance—for the ward which was left was so utilised—bears an inscription: "This site was originally the Marshalsea Prison, made famous by Charles Dickens in his well-known work 'Little Dorrit.'" The windows of the prison ward can be seen from the court alluded to, which is the second court on the right hand side of the Borough High Street, going from St. George's Church towards London Bridge. Dickens was very fond of painting this district, and it was in the adjacent Lant Street that Mr. Bob Sawyer entertained Mr. Pickwick and friends.

A CURIOUS state of affairs is reported with regard to Killmallock Castle, a reputed residence of the Desmonds, which some few years ago would have been demolished but for the intervention of the county Limerick grand jury. The structure is now in a dilapidated condition, and, overhanging as it does the public road to Limerick, is dangerous to traffic. The necessary repairs, however, cannot be executed, owing to the action of a tenant who is in possession of the basement of the tower, using it as a smithy, and refusing to quit the premises unless he gets £500 compensation.

A PROPOSAL is made to complete the restoration of Stratford-on-Avon Church, in the chance of which are the grave and monument of Shakespeare. It is intended to reconstruct the organ, relay the floor of the nave, provide new heating apparatus, new oak seats in the nave, and other necessary work, at a total expenditure of £5200, towards which only about £800 has been promised. The work is to be begun in January, and it is hoped to complete it by Shakespeare's birthday next year.

THE plans for the new Coronet Theatre, Notting Hill Gate, are approved by the London County Council. Mr. W. G. R. Sprague, the architect of so many of our suburban theatres, is responsible for them. The theatre will occupy an important site in High Street, Notting Hill Gate, open on three sides, having frontages to High Street, Johnson Street, and Uxbridge Street. The frontage to the High Street and return flank to Johnson Street, about 200ft. in length, is of an exceedingly striking and bold Louis Seize character. It will be entirely of white Portland stone, a well-designed tower some 70ft. high, with a copper dome, surmounted by a figure which bears 5000 candle-power, forming a feature at the corner, where is the entry to the better parts of the theatre. The audience will enter direct from the High Street into a circular marble vestibule, and thence by a short, broad marble staircase into the dress circle, balcony, and stalls. The house is to be on the two-tier system, and is without a single column, the construction throughout being of concrete and steel, and thoroughly fireproof. On the lowest level are stalls, pit-stalls, and pit, the first circle consisting of dress circle and balcony, and second circle consisting of amphitheatre, seats and gallery. In the better seats the entries are so arranged that access is gained on both sides of the auditorium, thus saving considerable discomfort in passing and repassing between the acts. The theatre will be amply provided with retiring-rooms, and large, well-appointed saloons are arranged for each section of the auditorium. As it is the intention of Mr. E. G. Saunders, the managing director, to run the house on very first-class lines, some considerable attention has been paid by Mr. Sprague in giving rather more accommodation than is usual to the dress circle, stalls, and private boxes. The sightseeing has been most carefully studied, so that the performance will be well seen from all parts of the house. The stage is of ample dimensions, being some 40ft. deep with a width of 65ft. and a height of 55ft. to grid. A complete block of dressing-rooms is provided off the prompt side of the stage, with lavatory and bath accommodation, hot and cold water supplies and ventilation. The decoration and furnishing throughout will be in Louis XVI. style, and the electric light will be utilised to the utmost in creating a most artistic and dainty effect throughout

the interior. Gas is laid on everywhere as a stand-by, in case of temporary failure of the electric light. Every possible precaution has been taken against fire, numerous hydrants being provided at every available point, while the double asbestos and steel-framed curtain can be lowered by one man in twenty seconds. The heating is by low pressure hot-water pipes and radiators, and the ventilation, sanitation, &c., have all been arranged on the most modern principles. The theatre will be able to accommodate some 2000 persons, and will be ready for opening early next autumn. The cost will be about £25,000.

THE New Burlington Art Gallery, the latest addition to our too numerous metropolitan picture galleries, opens at 15, New Burlington Street with a varied collection of oil and water-colour paintings, mostly in sketch stage. They are by young men who, though still rising, have already so far risen that their names are familiar as exhibitors at many important London galleries. Who is there does not know and appreciate the variety of subject and treatment given by the hand of Mr. Haité, President of the Langham Club? Other of these earnest student artists of the Langham are also seen in their strength; for the two-hour time sketches, executed periodically, are voluble of craftsmanship, power of speedy invention, and instructive feeling for composition. A drawing which shows all this at its best is Mr. Almond's "The Prisoner"; but Mr. Almond has other vigorous work, as well as an oil painting, of scrupulous finish, that has been seen at the Academy. A name not so well known as most of the others is S. R. Sime, but, if prophecy may be permitted, we predict that it will soon carry as much weight as any of them. Mr. Dudley Hardy (not in flippant mood), Mr. Breakspeare, Mr. Reginald Jones, Mr. Walter Bayes, Mr. Walter Fowler, and Mr. David Green are others who afford greatest interest.

THE Midland Railway Company has under consideration a scheme for the construction of a central station in Sheffield. The Company fully recognise the necessity of the proposed station, the only difficulty being the enormous expense which would be involved. The enlargement of the present station and the doubling of the main line for several miles, cannot, however, be delayed any longer.

THE panels for the decoration of the gigantic monument which Mr. Rhodes is erecting in memory of Major Alan Wilson's Shangani patrol are now being completed by Mr. Tweed, the sculptor. The first has just been cast in plaster ready for reproduction in bronze. Each member of the patrol is to have a place on the panels, and in the one completed there are eight life-size figures.

A FATALITY has occurred at Treviddo Viaduct, on the Cornwall Railway, between Liskeard and Menheniot, resulting in the loss of two lives. A new five-arch viaduct of granite is being built to take the place of the present wooden structure, and wooden ribs were being fixed, upon which the brickwork of the arch would afterwards rest. It was while one of the ribs of the fourth arch was being placed in position that the rope of 4in. manila cable, by which it was being steadily snapped, fatally precipitating two of the workmen nearly 80ft. below.

A LETTER from "A London Architect" appeared in these columns last week. "A London Builder" now writes:—"I have seen the letter in your issue signed 'A London Architect,' and I think it only fair to him that the statements which he has put forward should be either controverted or supported by the experience of a builder. It is satisfactory to know that architects are taking notice of the manner in which the men engaged in building operations are fulfilling their duties and obligations to the general public, because after all they are the employers of the workmen, architects and builders being only intermediaries, and it is some consolation to the builder to know that the undue increase of

cost of all building works will be placed to the account of the parties who are the cause of it, and not put down to the credit or discredit of the grasping employer. So far from your correspondent having underrated the case against the workmen, I am quite certain it is otherwise; and I am sure the experience of other builders will confirm what I am about to submit. That is, that on many jobs in London at the present time the bricklayers do not lay 450 bricks per day nor half that number, and I am not now referring to glazed bricks, or any special or expensive kinds of bricks, but ordinary common stocks or like quality. I do not suggest that this method of fulfilling their obligations is confined to the trades mentioned, but it is general, and the men do credit to their teachers, if not to themselves. It is not many years since they were told openly, either in Trafalgar Square or Hyde Park, at a meeting to consider the question of the number of unemployed and the remedy for it: 'You, each of you, do half the work you are doing at the present time, and there will be work for two where there is now only work for one.' It will be asked, What can this have to do with trade unionism? Well, in reply to this question the answer is that such a temporary violation of economic law can only be effected by organisation on the part of the violators—individual effort would be powerless.

"THE foregoing observation," "A London Builder" continues, "applies with equal force to the other illustrations given by your correspondent, of the numberless ways in which an employer of labour is molested and interfered with in the conduct of his business, and the absurd contentions put forward as to which and whose particular right and province it is to perform what in many instances are trivial and unimportant operations. The employers in the present dispute have made enormous sacrifices in contending for the principles that:—(1) Labour is entitled to be paid for at market rates, and, in view of the severe competition, 'free trade,' under which they obtain their orders, at a rate which will enable them to successfully compete with their competitors, and not on any sentimental standard rates which may be adopted or put forward by the men who run trade organisations, and in very many instances could not possibly keep a job where competitive merit came into play or existed. For, after all is said, the question of hours in the present dispute is a question of wages, nine hours pay for eight hours' work. (2) That the employer is to determine in what way he should conduct his own business and utilise the machinery and appliances which he has expended his capital on for the purpose. It is difficult to see how the intervention of third parties can aid the permanent settlement of a question or questions where both sides fully realise and comprehend all the points involved, and where the only solution is the surrender or abandonment of the position which has been taken up. In this instance the employers at any rate recognise that the intervention of third parties can mean only the unsatisfactory method of 'auctioneers' equity,' and they are not prepared to crown their eighteen weeks of sacrifice with such a miserable result. If this conflict results in a demonstration that there are economic laws which, as other natural laws, must be regarded and not violated, however great the sacrifices may be which have been made by both the parties, they will not have been made in vain if the principle is brought home to the minds of others engaged in industrial operations before they enter into a similar conflict."

ENQUIRY DEPARTMENT.—We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall, at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

DESIGN & DETAIL OF DOMESTIC BUILDING.

By JOHN E. NEWBERRY, A.R.I.B.A.

PRELIMINARY.

DURING the last six months a series of very instructive articles appeared in the BUILDERS' JOURNAL, by Mr. Lanchester, on "The Planning of Small Houses." The author there showed how inexpensive and conveniently arranged residences might be planned so as to profitably utilise every inch of space, and at the same time obtain a good architectural effect. It now devolves on the present writer to attempt a brief exposition of some methods of treating the various parts of a house, illustrated by practical details. I fear that much of what I have to show or say will be merely a repetition of the common practice of many of the readers of the BUILDERS' JOURNAL. I hope they will forgive my repeating what has so often been better said, and bear in mind that these papers are specially intended for students.

It seems to be a very generally received notion that it is possible to design the elevations of a house from a given plan in any style. This is, of course, absurd, for the exterior should always express as far as may be the arrangement of the interior. It is not intended to deal with any so-called "styles" in these notes, but with the current or vernacular phases of building in vogue at the present time. I feel very strongly that the best and most original work will only be produced by a careful study of good modern Architecture.

I remember Mr. Waterhouse saying, in one of his presidential addresses to students, that if we were ever to see a living Architecture grow up in our midst, we must be of one mind as to style, and each must determine to contribute his quota to the general development of our Art. And this not by aiming at startling effects, but by giving to our work our best and most earnest thought.

Some admirable precepts are to be found in Mr. Beresford Pite's "Design in Drawings," in the April and May numbers of the ARCHITECTURAL REVIEW, notably his remarks on the importance of feeding the imagination with healthy, stimulating food, and cultivating a recollection of beautiful proportions and details, but always with the exercise of a discerning criticism on everything architectural. The power of being able to appreciate and differentiate good from bad work is all important, and may be acquired in a very great measure by careful study.

It is in this selection of what most appeals to one's individual taste, and in the carrying on a step farther of what someone else has well begun, that the personal idea and imagination of a man is displayed. In our daily peregrinations how rarely do we see a domestic building that gives real pleasure. The majority of small houses are too evidently built without the assistance of an architect, and are monuments (fortunately not lasting) of the vulgarity of our popular taste. The want of simplicity that is to be observed in many of our suburban houses is painful in the extreme.

It is a seeming paradox, though nevertheless true, that plain things often cost more than those that are well named "fancy articles." I would wage a crusade against the wretched little pretentious houses everywhere springing up, bedecked with what the Yankees appropriately term stone "trimmings." Instead of badly executed masonry, with incised carvings of atrocious design, framed in brick-work smothered with red-ochre and tuck pointing, one sighs for some honest, well-built, plain wall surface. And this leads to the oft-repeated axiom that breadth and simplicity, with a concentration of the interest in one or two important features, is the elemental principle of all good design. It is most difficult to obtain an effect of breadth in a small house unless it be simply roofed, and unless every atom of plain wall surface be religiously preserved.

The value of a simple and beautiful outline should also never be lost sight of, and the eye must be carefully trained and accustomed to discriminate between good and bad proportion.

Scale, or the proper proportion of the various parts, is also essential to good designing. Unnecessarily large doors and windows, and coarse detail of all kinds, destroy the scale of a house. It is an excellent reminder of the relation of parts to a whole, to sketch a human figure to scale on the elevation or section that one is designing.

It may be instructive to mention here a few of what I consider the most noticeable sins against good detail and proportion. For instance, the custom of giving too great a projection to the oversailing courses of a chimney-stack is entirely a matter of want of thought. The block of the stack is more often seen angle-wise than directly in front, and consequently the projections generally appear exaggerated, and cause a top-heavy appearance. The shape of windows is not considered sufficiently; they too often appear to have been determined on plan without a proper regard having been taken of their height. Neither do the sash-bars divide the panes into pleasant proportions.

And in internal detail we see unnecessarily huge architrave mouldings around doors and windows, deep and coarsely moulded skirtings, coved cornices spreading over the ceiling, and centre flowers plastered up with clumsily modelled ornament. These and their like destroy the apparent size of our rooms, and are meaningless repetitions of an outworn convention. Fireplaces are needlessly spoilt by the introduction of clumsy marble chimney-pieces with cast-iron grates of pretentious design. This is unpardonable nowadays, when cheap and excellently simple designs in cast-iron may be obtained from many of our best manufacturers.

The elevational treatment of a house, which should be borne in mind from the first inception of the plan, is governed in a great measure by the following considerations: (1) Whether the plan be symmetrical or otherwise; (2) The heights of the floors; (3) The materials to be employed, and the arrangement of the roofs and their pitch, the latter being dependent on the nature of the roof covering; and (4), probably the most important factor of all, viz., the form of window to be adopted. This last item I consider of so great importance that I propose to divide my articles somewhat as follows:—

1. A country cottage of red brick with tiled upper part and roof, the windows to be of wood with iron casements.
2. A brick house with sash windows, the frames of which are to be designed to show.
3. A bungalow with wood casements, rough cast walls, and a slated roof.
4. A brick and tile house, half timbered above. And
5. A stone or brick house with stone mullion windows and iron casements.

Regarding the choice of materials, I entirely agree with what Mr. Lanchester says as to the advisability of always adopting, as far as possible, local methods and products. Such buildings not only harmonise better with their surroundings, but are also generally less costly than when material has to be imported from a distance. But, whether we have to bring our materials from afar or not, a little time and trouble spent in their selection is amply repaid in the resulting building. It is here that the architect's judgment and experience is so invaluable: for well-chosen materials, properly used, will go far to redeem an otherwise commonplace design. At the same time much discretion had to be exercised in the choice of such materials, for they should not only satisfy the eye, but must also be the best that are available for their purpose.

In the next article I propose to deal with the design of a cottage for a rural district, and to give explicit details of the windows, doors, eaves, tile hanging, and chimney stacks for such a building.

(To be continued.)

OBITUARY.

SIR HENRY DOULTON.

THE Art world suffers a conspicuous loss in the death of Sir Henry Doulton. The head of the renowned firm of potters, Messrs. Doulton and Co., died a week ago to-day; he bequeaths to Art pottery the richest legacy which has, within recent years, ever tended to its development and popularisation. In his death, London loses also one of its "captains of industry." To Sir Henry was mainly due the success which his famous firm has attained, and also the artistic merits of its productions. The deceased knight had also many endearing qualities as a man and as a citizen, but his name is mostly identified in the public mind with the firm of Doulton and Co., and it is in this connection that his name will be honourably handed down through long successive years.

THE SON OF A LAMBETH POTTER,

Mr. John Doulton, Sir Henry was born at Vauxhall in 1820, and after leaving University College School joined his father's business, preferring to become a practical potter rather than accede to the desire of his parents to take Orders or to be called to the Bar. He went through every kind of work, having to turn his own footwheel, and after two years succeeded in making a twenty gallon receiver, and for some time made the whole of the large chemical ware. He constructed the first steam wheel that ever was made, with the assistance of a man named Berry. Among his early customers was John Bennet Lawes, whom he never met for fifty-five years, till one day, not long ago, at Marlborough House. When twenty-six years of age Sir Henry initiated the

MANUFACTURE OF SANITARY PIPES,

in the making of which he obtained his first great success. Twenty-four years later—in 1870—he took up and greatly developed the production of what is now known all over the world as "Doulton ware"—ornamental pottery in vases, jugs, cups, &c. A Doulton vase is generally made of a rather hard gray or brown ware, on which a sharply incised realistic design is drawn—a bird, or a group of rushes, or what not—and either a part or the whole is then richly enamelled in blue or dark brown. As is commonly the case with pottery, the originality of the firm of Doulton was not allowed to pass unchallenged; and a claim of priority was put forward for what was known as the Martin Pottery, a very similar manufacture. Rightly or wrongly, however, the great public decided to call the material by the name of Doulton ware; and as such it has long had immense vogue. Its merits are indisputable, and though it would be probably be better if it were somewhat rarer, it is honest, useful, and in good taste. Sir Henry Doulton's

ART WORKMANSHIP

revolutionised the trade, and the Council of the Society of Arts made him a vice-president, and he became a member of the Cordwainers' and Turners' Companies, a Chevalier of the Legion of Honour, and an Associate of the Institute of Civil Engineers. He took great interest in Exhibitions, from that of 1851 downwards, and the display of his goods added to his fame. In 1871 the Queen purchased some Doulton ware, and the demand rapidly grew. In 1876 a magnificent collection was sent to the Philadelphia Exhibition. But Sir Henry Doulton's energies were not wholly devoted to business; he was something more than a successful business man, and in addition to church and other work, he was Almoner of St. Thomas's Hospital. He was fond of riding and travel, and thoroughly an *amateur* with the literature of the day. Poetry was his specially favourite study, and he used often to say, when asked to lecture on Pottery, "I would rather lecture on Poetry." The head of Doulton and Co. was knighted on the occasion of the Queen's Jubilee in 1887. Latterly, Sir Henry has spent much of his time at his country house, Woolpits, Ewhurst. The funeral took place on Monday, at Norwood cemetery.

CAMPSBOURNE SCHOOLS, HORNSEY. EXTERIOR OF BOYS' AND GIRLS' DEPARTMENT.

NEW SCHOOLS AT HORNSEY.

CAMPSBOURNE SCHOOLS, which were opened recently, and of which we give illustrations, have been built upon a site acquired some time since by the Hornsey School Board, containing an area of 2a. 1r. 0p., and have the advantage of entrances from Boyton Road and Eastfield Road, with frontages to Newland Road on the north, and to the proposed extension of Nightingale Lane on the west. With so large an area, the question of the plan for a school to accommodate over 1400 children at once arose, and, under the advice of its architect, the Board decided to erect the building in two blocks, one to contain a two-story building for the Girls' and Boys' Departments, and the other a single story building for the infants. This scheme was not adopted until it had been thoroughly thought out, and as the Board was advised that such buildings would be somewhat cheaper than a three-story building, this plan was decided upon. Beyond the above two blocks, a caretaker's house has been erected at the entrance from Boyton Road, and separate buildings have been built for manual instruction and for cookery teaching. Each of the three departments is provided with a separate hall for assembling and other purposes.

THE GIRLS' DEPARTMENT

is situated on the ground floor of the two-story building, and contains accommodation for 450 scholars, in eight class-rooms, which are grouped round the central hall. This hall is 86ft. long by 28ft. wide, and 15ft. high in the clear, being well lighted from the ends as well as from borrowed lights from the class-rooms. At the south end of the hall, cloak room accommodation is provided, and at the north end a head mistress's room and lavatory. The approach to the boys' department, which is situated on the first floor, is from the north end of the building by two fireproof staircases. This department is a duplicate of the girls' department, and will contain the same number of scholars. The roof to the large hall on the boys' floor has been constructed as an open timber roof, which gives the hall increased height and character. Assistant masters' and

mistress' rooms are provided on the mezzanine floor of this building, and caretaker's store rooms.

THE INFANTS' BLOCK

provides accommodation for 510 scholars, in seven class rooms, and a large assembly hall, measuring 50ft. by 25ft., is also provided for their use, with cloak-rooms and lavatories in convenient positions. On the level of the class-rooms is a head mistress's room, and on the mezzanine floor a cheerful room has been provided for the assistant mistresses. One of the features of this department is a baby's room, fitted with circular galleries, on the lines of a theatre, to facilitate the teaching of very young children. The manual instruction room contains accommodation for twenty-four scholars, and beyond ample space for the benches a gallery is provided for teaching purposes, with a cloak-room and wood store adjacent. The cookery kitchen contains accommodation for forty scholars at a time, and a scullery has been erected adjacent to the kitchen. Cloak-room accommodation is also provided for this building. The whole of the class rooms throughout are heated with "Boyd's" patent hot-air stoves, and the halls and corridors by a low pressure hot water apparatus, worked by boilers situated in the basements of each block of buildings. All the

CLASS ROOMS

are designed so as to be lighted from the left hand, and all have full provision for fresh air inlets, and extract flues from each room. The buildings, externally, have been carried out in stock brickwork, with red brick dressings and red "material" finishings. Internally, the walls are built to a dado height in brown salt-glazed dipped bricks, and above such dados are finished with buff Gamlingay bricks. The lighting has been supplied by gas; the "Clapton" lights being used throughout. The drainage has been carried out on the most approved principles, from the architect's drawings; the closets and lavatories used being those manufactured by Messrs. Adams and Company, of Old Queen Street, Westminster. The amount of the contract for the work was £20,467, including the whole of the accessory buildings and the playground walls and finishings, which works out at the reasonable cost

of £14 10s. 3d. per scholar, and including the cost of the fine freehold site the sum is £15 18s. 8d. per scholar. Comparing this cost with that of recent Board Schools it will be seen that it is a low one, and justifies the advice given by the architect to the Board, as to erecting the buildings on the principle he advised. The whole of the works have been executed by Messrs. Kirk and Randall, of Woolwich, from designs prepared by Mr. Howard Chatfield Clarke, of 63, Bishopsgate Street Within, E.C., under whose personal direction the works have been carried out. The heating was supplied by Mr. W. J. Fox, of South Place, Finsbury, E.C. The "material" staircases and dressings were executed by the Patent Impervious Stone Company, of Victoria Street, Westminster. The lighting and the whole of the gas-fittings were carried out by Messrs. Strobe and Company, of Osna-burgh Street, N.W., and the hot air grates were supplied by Messrs. Hendry and Pattison, of Marlborough Mews, Oxford Street.

The first list of subscriptions towards the building fund of the new cathedral in Loughrea amounts to £5600. About £14,000 more will be required to complete the edifice, which will be one of imposing dimensions and great beauty.

By whose authority and for whom are certain windows in the west front of the Palace of Westminster, facing the Abbey, being disfigured by the erection of cases over the stonework, in which it is apparently intended to place sun-blinds?

It is reported that the London and North-Western Railway Company has decided to tunnel Shap Fells, Westmoreland, the climbing of which involves so much delay to through traffic. The tunnel will be over nine miles long, and will take several years to construct.

The manager of the London County Council Works Department having reported that the architect's estimate of £4170 was, in his opinion, not sufficient for the work specified for the enlargement and alteration of Hampstead Fire Station, public tenders were invited. The lowest tender was £4955, and the highest £5372.

SURBITON "MUNICIPAL OFFICES" COMPETITION.

THE awards in this competition are as follows: Selected design, with premium of £15 to No. 25, Messrs. W. W. A. Forsyth and H. Maule, 16, Great Marlborough Street, London; second, with £30 premium, No. 11, Messrs. C. W. Wimperis and H. S. East, London; third, Messrs. W. E. Hewitt and Arthur H. Ryan-Tenison. That the selected design is awarded only the second premium is due to the fact that the Council has not endorsed the assessor's award, which was made to No. 11, Messrs. Wimperis and East, but has chosen the design placed second by its assessor, Mr. E. W. Mountford, although the premiums remain as originally allotted. Twenty-six designs were sent in, from which the assessor selected the three above mentioned, and in his report Mr. Mountford spoke of them all as having particular merits to recommend them, and finally decided on No. 11 as holding the greatest advantages and being the design best fulfilling the requirements of the Council. The plans sub-committee, however, reported that it could not endorse the recommendation that No. 11 should be commissioned to carry out the work, being of opinion that No. 25 was preferable, particularly with regard to its elevation, as bearing upon the position of the site. Subsequently Mr. Mountford addressed a protest to the committee, from which the following is an extract: "The reasons for which I prefer the design I placed first to that placed second in the competition are as follows: (1) The plan is more compact, and in respect of the arrangement of the offices for the Council, clerk, and surveyor respectively, is distinctly better than the other; (2) as regards architectural merit, it is in every respect superior, showing far more originality and knowledge of detail; (3) owing to its simplicity, it is distinctly less costly to build; (4) for the same reason the cost of future maintenance will be less." The Council, however, after some discussion, approved the vote of its sub-committee, and the awards have been granted as above stated. The whole of the designs submitted are now on view at the Gables Theatre, opposite Surbiton Station.

THE BOROUGH POLYTECHNIC.

WELL-DESERVED gratulation took place on the occasion of the annual prize-giving at the Borough Polytechnic, on Monday week. The ceremony was performed by Professor Stuart, M.P. Previous to the distribution our representative visited the workshops and laboratories, which, in some instances, though cramped for room, turn out some really good work. The engineers' shop is one of the best in the metropolis, being ample in dimensions and well appointed with apparatus. In the bricklayers' and masons' shops several arches for windows and doors were in process of construction, the finish of which was all that could be desired, while an examination of the working drawings revealed that they were very clearly made out. In the carpenters' shop, again, much good work was shown, while in the drawing office of the engineering section every attention appeared to be shown to ensure the proficiency and comfort of the students, a remark which also applies to the Art school, while the work shown in the sections which are not within the pervue of this journal were equally satisfactory, demonstrating beyond all question that the Borough Polytechnic must exercise a vast power for good in its district. In the course of his opening address, Mr. Edna Bayley, L.C.C., said that while last year they had a total of 2400 students in all the classes, they had this year already entered no fewer than 2700, and he anticipated that they would have half as many again before the books were closed. Since the Polytechnic was opened in September, 1892, more than 10,000 students had passed through its classes. This year they had gained 23 exhibitions given by the London County Council, as against seven last year. From the profit—£2500—which they made out of the Jubilee seats, and from other sums which had since come in, they proposed to erect a gymnasium, workshops, physical drill rooms, a laboratory, and cookery class rooms, and, as an evidence that their classes reached the people for whom they were intended, he pointed out that in their trade classes there were over 650 actual workers in the several trades for which classes were held, and 90 per cent. of the students

attending the Science and Art classes were workers in various trades and industries. In only one class had there been a falling off, viz., in letterpress printing, which had dropped from 60 last year to 7 this. Having alluded to the establishment of University Extension lectures and a day continuation school for boys, Mr. Bayley called upon Mr. Mellis to read the report, the principal points in which are appended:—In the City and Guilds of London Institute examinations, 354 papers were worked and 194 passes gained; in the Science and Art Department examinations, 159 papers were worked and 107 passes gained; in the Society of Arts examinations, 75 papers were worked and 64 passes gained; in the National Health Society's examinations, 35 papers were worked and 31 passes gained, the total being 620 papers worked with 396 successes. For carpentry and joinery, A. Watson took second honours, £5, and a bronze medal; for painter's oils, colours, and varnishes, J. T. Keep took second ordinary, £1, and a bronze medal, and C. R. F. Strube a first ordinary, £1, and a silver medal; and for metal plate work, G. H. J. Denman took a bronze medal, with a third ordinary, and S. Pairblort a first ordinary, £2, and a silver medal, the Polytechnic taking altogether thirteen medals, the largest number gained by any corresponding institute in the United Kingdom. During the past session there has been a steady growth in the number of students attending the trade classes, and the number of medals gained is in itself evidence of sound work, because they have been won by students who have done good work for two or three years, and are thus the result of continuity of study. In conclusion, it may be noted that of the holders of the twenty-three Technical Education Board's evening exhibitions they are all engaged in some trade. Professor Stuart, M.P., delivered a short address, in the course of which he remarked that prizes fell to few, but the prize of education, and the ability to face the world, was open to every intelligent worker. The students of the Borough Polytechnic were engaged rather with the scientific than the literary side of education, though the latter was certainly not neglected, for there were libraries opened, and lectures delivered. The object of their literary train-

CAMPSBOURNE SCHOOLS, HORNSEY. EXTERIOR OF INFANTS' DEPARTMENT.

ing was to impart a capacity to read books, and listen to discourses with the greatest possible advantage. With this purpose in view a student, after hearing a lecture, should try and think it over in his mind from the beginning, and this would impress it on his memory. Similarly, in reading a book one should, before going to sleep, mentally repeat all he had read that day, and make a *précis* of it in writing. As regards the scientific side of their work, he was glad to see the practical training united with the theoretical; such a union greatly heightened the value of their work. All scientific and technical education consisted of three portions—observation, reasoning, and experiment—and the opportunities for attempting these three things lay ready to everybody's hand. Many failures in life resulted from neglect to seize such opportunities, and it was the great aim of polytechnics to provide working men with fair opportunities, and to see that they took advantage of them.

STATION IMPROVEMENTS AT LEEDS.

CONSIDERING its size and importance, Leeds cannot greatly boast of its railway station accommodation. Something, however, has been done of late to improve matters. What the North-Eastern has accomplished in respect of extension, the Great Northern and Lancashire and Yorkshire Railway Companies have now effected in respect of rearrangement. The change may be regarded as a notable one, seeing that space is limited. Certainly everybody who is in the habit of travelling to and from the Central Station will appreciate the efforts made to meet their convenience and comfort. Broadly speaking, the alterations are as follows: The roof has been raised to the extent of 6ft., the station space, apart from the platforms, has been considerably enlarged, the arrival platform has been widened, a spacious new cloak-room has been provided, the booking halls have been rendered much more commodious, the waiting-room accommodation has been and is being increased—the work is not quite complete—the parcels-office has been removed to a more convenient quarter, and the public will no longer be incommoded by goods of various kinds awaiting transference to train or van when the station is being entered. The most difficult undertaking was the raising of the old portion of the roof. A large quantity of glass has been inserted in the new roof, the old cast-iron girders have been taken out and truss girders inserted, thus giving the overhead arrangement a lighter appearance as well as brightening the station below. To furnish more space for people who throng the station at certain times—especially on Saturday evenings—the barriers at the head of the platforms have been set nearer the trains; moreover, the area available is further cleared by the provision of a fine cloak-room near the steps, piles of commercial luggage that formerly adorned the open space being thus removed under cover. This alteration has meant the erection of a new structure on one side of the station front. The edifice extends to Wellington Street, and covers the steps by which so many passengers prefer to leave the premises when they arrive by train. The Lancashire and Yorkshire portion of the building, immediately adjoining, has also been improved; the booking and parcels offices are both enlarged and rearranged. The site of the joint refreshment department, too, has been changed. Refreshments may now be obtained in rooms situated almost where the old cloak-room stood, on the left as one passes through the G.N. booking hall, while the G.N. parcels office is transferred from the old corner to a position higher up the yard on the hotel side, where, under a new verandah, away from anxious passengers, business may be carried out with greater facility and despatch. Close by, but in the station itself, new ladies' waiting-rooms are rapidly approaching completion. Again, by setting back and lengthening the waiting-rooms on the arrival platform, another desirable improvement has been brought about.

Professional Items.

BARCALDINE.—The work in connection with the restoration of the ancient and historic Barcaldine Castle is being rapidly proceeded with, under the direction of Mr. Butler, architect, Perth. The castle, which is situated near the highway between Connell Ferry and Shian Ferry, is a rare example of ancient Scottish Architecture, and was built in the sixteenth century by Sir Donald Campbell of Glenorchy. It has been roofless for many years, but since coming into the possession of the present owner the work of restoration has been gradually proceeded with. The roof is now complete.

DERBY.—The brewing firm of Offilers Ltd. are now erecting spacious offices at their establishment in Ambrose Street. The ground floor will be devoted to the clerical staff. The first floor comprises a handsome board room for the Directors, having a fireproof floor. The walls will be covered with massive moulded panelling, all in pitch pine. The other offices are fitted with every modern convenience. The building is constructed in red bricks, with stone dressings to the doors and windows. Mr. Geo. Yates Mills, of Old Bank Chambers, is the architect, Mr. George Durant, Grange Street, Derby, being the builder.

DOVER.—A conference has taken place at Dover between the head officials of the London, Chatham, and Dover Railway and the Dover Harbour Board. The railway company is endeavouring to develop a scheme for a new joint station, which is to be erected at a cost of £100,000. The matter has been talked of for years, but is only now taking practical shape. The railway company intends to apply for powers to close a crossing known as the Crosswall. To carry out this scheme a portion of the electrical tramline will have to be diverted. The company intends also, it is stated, to widen and strengthen two of its bridges in the town, thus facilitating vehicular traffic.

DUBLIN.—The heavy-looking sombre structure, in Burgh Street, which has figured in history as Conciliation Hall, and later on as a corn store, has now been transformed into a place of entertainment, as the Grand Lyric Music Hall. The first thing that strikes the visitor is the new façade, painted in light, well-chosen colours, surmounted by an emblematic figure. The various entrances are under the shelter of a glass and wrought-iron verandah. The work has been executed by the firm of Messrs. Meade and Son, working from the plans of Mr. W. H. Byrne. The verandah was supplied by Mr. M'Loughlin, Brunswick Street. The interior of the hall is handsome and roomy. The proscenium opening is a notable piece of work; it is surmounted with a large figure of Music, flanked by two winged figures with trumpets, the sides being supported by two half figures, heroic size, and draped with festoons. The platform is semi-circular, and the roof coved so as to throw the voice of the artists out into the auditorium. At the back is a balustrade, from which rise pilasters that in turn support a highly ornamented cornice and the roof. Paintings of landscapes will be introduced between these pillars to give an idea of depth. The lighting of the stage has been a subject of careful consideration between the architect and the contractors. The ceiling is a strikingly successful example of elaborate ornamentation, and the same expression fairly describes the scroll work in front of the balconies, the cornices round the hall, and the decorations of the many panels throughout the building.

The erection of the new premises in Dublin of the National Telephone Company, facing Temple Bar and Crown Alley, and directly in rear of the Exchange, has almost been completed. The new structure measures about 85ft. by 65ft., and it has a height of about 76ft., while directly to the eastward of it is a cleared space extending for at least 80ft. on which the Company intend to build in continuation of

the great structure now approaching completion. In the frontage Portmarnock brick, with granite dressings, has been used, while inside the brick used has been obtained from Kingscourt and Harold's Cross.

DUFFIELD.—The Church of All Saints, Duffield, has been reopened after being closed for a considerable period for extensive alterations and renovation of the fabric, which have been carried out on an extensive scale at a cost of about £4300. The church itself is not, from an exterior view at any rate, an attractive building, being a combination of styles without any distinct character. It has weathered the storms of several centuries, and fifty years ago it was found necessary to effect its complete restoration, and an elaborate scheme was prepared and subsequently carried out. The building is especially interesting to archaeologists on account of its historic associations, portions of the original structure being yet traceable. Few additions have been made of any material consequence since 1847, and it was deemed expedient, as on that occasion the structural alterations were only such as were absolutely essential, to modernise the fabric of the church to some extent. The improvements made include a new chancel screen and pulpit of carved oak, and three beautiful stained glass windows in the chancel. In addition to these a handsome screen of carved oak has been placed at the west entrance to the church, and the choir stalls have been superseded by similar material. The flooring has been taken up, and black and white marble substituted, with red marble steps in the approach to the chancel, and Hopton's stone paving introduced in the paving of the body of the church, with a mixture of red marble. An entirely new high-pressure heating apparatus has been fixed, and a quantity of plaster has been removed, so as to bring into view the fine old timber roof of the chancel. A new system of gas lighting has also been adopted, and a beautiful stained east window from the study of Mr. C. E. Kemp, and a reredos and altar and rails of carved oak, are innovations greatly welcomed. The whole of the work has been carried out by Mr. Robert Bridgman, of Lichfield, the architectural matter receiving the attention of Mr. J. A. Scott, son of the late Sir Gilbert Scott.

ERDINGTON.—The foundation-stone of a boys' new department, which is being erected in connection with Erdington Board Schools, has been laid, and at the same time a medallion of the Queen, which has been let into the wall in commemoration of her Majesty's Diamond Jubilee, was unveiled. Mr. C. Whitwell is the architect. The buildings in course of erection comprise a boys' department to contain 310 scholars, a large room or workshop for manual instruction, and a cookery centre. As soon as these are ready for occupation the present boys' school is to be extended so as to accommodate 120 additional scholars, and it will then be used as a girls' school. New teachers' rooms are also to be added and additional cloak-rooms formed. The amount of the builder's contract (inclusive of boundary walls, outbuildings, forming playground, warming, &c.) is £5629.

FORT AUGUSTUS.—The inhabitants of the picturesque village of Fort Augustus have just erected a drinking fountain in honour of the Jubilee. The fountain stands on a commanding site near the top lock of the canal, is about 6ft. in height, and is surmounted by a powerful lamp. The design of the fountain is by Messrs. Walter Macfarlane and Co., Glasgow.

HAMPSTEAD.—The Central Public Library in Finchley Road, Hampstead, was opened a few days since, the foundation stone having been laid exactly a year ago. The architect was Mr. A. S. Tayler. The Central Library is a two-story building of the domestic Tudor style, built of Cranleigh red brick, with dressings and mullions of Portland stone. It stands at the junction of Arkwright Road and Finchley Road, with a frontage to both thoroughfares, being in almost the centre of the parish. The

upper ground floor comprises the reference library and reading-rooms, the lower floor accommodating the lending library, with various stores and offices. The reading-room is light and lofty, and will be devoted to newspapers and railway time-tables. The reference library, the finest room in the building, is 50ft. long, 30ft. wide, proportionately high, and lighted by windows on every side. The building contract was for £4954, a sum more than paid by Sir Henry Harben's gift of £5000. About one third of the site is left for future treatment.

IPSWICH.—The Ipswich Dock Commission has decided to construct the following contingent and other works, viz.:—(1) Swing bridge over new entrance lock. (2) Pier or jetty from south end of promenade—both these works to be in substitution for the somewhat similar works authorised by the Act of 1877. (3) A quay or landing stage on the north-west side of the dock, with necessary buildings, cranes, and appliances. (4) A swing bridge over the old entrance lock, with any necessary alterations to such lock. (5) Continuations of the tramway from the South-east Road of the Dock, along the South Road across the swing bridge to a junction with the proposed dam, and with a reclamation of sufficient of the south-east corner of the dock to obtain the required curves; also continuation of such tramway along the Ballast Wharf, across the swing bridge over the old entrance lock, to a junction with the tramway in the East Road; also continuation of the tramway along West Road of New Cut from termination of present Griffin tramway, with all necessary doublings, crossings, and sidings.

LAXEY, ISLE OF MAN.—In a limited competition for the Primitive Methodist New School Chapel, the design of Mr. T. Taliesin Rees, Birkenhead, was selected. The building is planned with a central hall and five class rooms, divided by means of folding glazed screens, so that the whole can be converted into one large room capable of accommodating 500 persons. In the rear are kitchen, lavatory, committee room, heating chamber, &c. The materials will be local stone, finished in cement, and pitch pine, varnished, for internal woodwork; heating by low pressure hot water. The style is late Gothic, with traceried windows, filled in with leaded lights.

LISKEARD.—The Borough Surveyor (Mr. T. McMeikan), in accordance with the directions of the Town Council, has made a careful inspection of the tower of the parish church, and handed in a written report, in which he stated that several cracks are apparent in different parts of the masonry, due, doubtless, to the defective foundations, this being particularly noticeable in the north and south walls, which were bulging seriously. A considerable portion of the masonry is of a very poor character, and portions may fall at any time; and the stability of the tower had been so seriously interfered with as to render it dangerous to persons in the immediate vicinity, more especially in the west end of the church itself. A copy of the report has been sent to the vicar and churchwardens, with a request for a reply.

NEWCASTLE.—The Tyne Improvement Commissioners have decided that the portion of the north pier at the mouth of the river, destroyed by the gales last winter, should be rebuilt at an estimated cost of £300,000, the work to be done by contract. They have appointed Sir J. Wolfe Barry and Messrs. Coode, Son, and Matthews, London, as their engineers for carrying out this work.

PRESTON.—The award in the arbitration which took place a few weeks ago, in the case of the London and North-Western and Lancashire and Yorkshire Railway Companies and Messrs. William Harding and Co. Limited, Fishergate, has just been received. The companies proposed to take a piece of land

occupied by Messrs. Harding and Co., which at present causes an awkward curve in the line, and in the vicinity of which several accidents have taken place. The companies propose to straighten and widen the line, and to enable them to do this they sought to acquire the property in Fishergate. Mr. Daniel Watney, of London, who was the arbitrator, has sent in his award as follows:—The companies to pay £23,264, the front portion to be taken over on December 1st, and the rest on June 1st.

RHYL.—Plans have been approved for the erection of an arcade containing some forty shops and a theatre, constructed on the latest principles, at a total estimated cost of about £20,000. The arcade will extend from the Parade at a point near the Queen's Hotel to Sussex Street. The present Queen's Hotel will be extended over the entrance to the arcade, thus adding about forty additional bedrooms to the accommodation of the hotel. The extension will be carried out in character with the imposing Architecture of the existing building. The theatre will be capable of holding from 1500 to 2000 people, and will be one of the most modern and compact in the provinces. Messrs. Darbyshire and Smith, of Manchester, are the architects. The arcade, which together with the theatre will be lit throughout with electric light, will be roofed with glass, and so arranged and constructed as to make it a fashionable promenade. This ambitious project is the undertaking of Councillor J. S. Greenhalgh, of Rhyl and Rochdale.

SHEFFIELD.—At Carver Street Wesleyan Chapel, the foundation stones have been laid of a building which is to contain new schools and a lecture hall. The scheme involves an outlay of something like £4500. The new buildings are being erected upon a plot of land adjoining the present schools and fronting to Rockingham Street. On the ground floor, entered by a large central doorway in Rockingham Street, there will be two large meeting-rooms and four classrooms, with a central hall available for physical exercises. In the centre opposite the front entrance there will be a wide stone staircase, which extends to the top of the building. The lecture hall, on the first floor, will be 50ft. square, lighted on three sides by large circular-headed windows, and fitted with a handsome rostrum. The walls, to a height of 5ft., will be finished in Keen's cement, and the ceiling will be panelled and moulded in pitch pine. Over the lecture hall will be the boys' and girls' school, consisting of a central hall, size 50ft. by 25ft. by 27ft. high, lighted at each end by large arched windows, proposed to be filled in with cathedral-tinted glass. On each side of this central hall provision is made for eight classrooms, four being on the hall floor and four on the gallery floor, approached by two staircases and balconies. Alterations and additions are to be made to the old buildings. Both new and old buildings are to be heated on the low-pressure water system. The new buildings are to be of special red brick, relieved with pilasters and moulded and arched panels, and by brick and stone cornices and strings. The contractors for the mason and bricklayers' work are Messrs. Malthouse and Ward, for the joinery work Mr. Enos Moore, for slating Messrs. Stanforth and Lee, for plastering Messrs. Hudson and Dore, for plumbing Mr. Hickson, for heating Messrs. Newton and Chambers, for furnishing Messrs. Redmayne, May, and Co., and for lighting the Gas Company, all of Sheffield. The architect is Mr. Herbert W. Lockwood, of Pinstone Street.

A special course of ten lectures on Architecture are to be given by Mr. Hugh Stannus, F.R.I.B.A. (teacher of architectural modelling at the Royal Academy, lecturer at the Royal College of Art, South Kensington, &c.), commencing to-day, the 24th. Each will comprise three parts, viz., half an hour for examination of work, an hour for the lecture, and another half an hour for conversation on the subject of the lecture. They have been arranged entirely by the Sheffield Society of Architects and Surveyors.

Trade and Craft.

MESSRS. EASTWOOD AND CO. LIMITED.

The offices of this firm, situated at Belvedere Road, Lambeth, are being rebuilt, and, consequently, the firm has temporarily removed to 61, Temple Chambers, Temple Avenue, Victoria Embankment, E.C., where, for the present, all communications should be addressed.

THE KRONAND METAL COMPANY.

The Kronand Metal Company Limited is showing, at the Stanley Show held at the Agricultural Hall, a large assortment of non-rusting hubs, pedals, tubes, rims, spokes, lamp brackets, &c., manufactured of its well-known Kronand metal. The metal polishing, equal to silver, wears white throughout, and requires no plating. Although since the introduction of this metal at the last Stanley Show many other alloys have been placed upon the market, claiming the same qualities as the celebrated Kronand, this Company maintains that Kronand is still the whitest and strongest white metal. The Company, being proprietor of one of the most complete works in Birmingham, is able to manipulate the metal from the ingot to the finished article. The works of the Kronand Metal Company Limited, at Nechells, Birmingham, are now nearly completed, and comprise rolling mills, tube and wire drawing plant, stamping, casting, and finishing shops, with the latest up-to-date machinery, covering in all more than three acres.

THE CONDUIT AND INSULATION COMPANY LTD.

One of the principal productions of this Company, whose offices are at Ormond House, 63, Queen Victoria Street, E.C., is the Steel-Armoured Insulating Conduit, which is made under the Johnson patents. It is described as the latest result of the gradual development of the "Interior Conduit" system of electric wiring, and is a great improvement upon the iron-armoured conduit first put on the market, as both the insulating lining and the steel armouring are considerably reduced in thickness, but without any decrease of efficiency. The outside diameter of the Insulated Conduit is the standard for gas piping, so that the same tools and standard sizes of pipe hooks, saddles, &c., obtainable from all ironmongers, can be employed; it has however been found desirable to alter the standard gas thread, and one has been adopted which is suited to the thinner steel armour and better fitted to electrical requirements, the screw thread used in these "electrical pipes" being based on that employed in connection with brass work, which is lighter in cut and contains more threads to the inch than that used for iron. This lighter and longer thread has the advantage of making the coupling sockets connecting the lengths more watertight. Moreover, in the case of the larger sizes of conduits, it reduces the labour of thread cutting, so that one man with ordinary tools can quickly and easily cut and thread all sizes of conduit necessary upon an installation. A special die plate, to cut the lighter thread, can be purchased at a moderate sum, and it can be used in the standard die stock already possessed by those installing gas or water-pipe systems. The Steel Armoured Insulating Conduit is further recommended for its labour advantages over gas and water piping in respect to handling and bending. All the sizes (from $\frac{1}{2}$ in. to $1\frac{1}{2}$ in.) are manufactured in 10ft. lengths, each end is reamed and threaded, and one coupling is supplied with every length. Another special feature of the Steel Armoured Insulating Conduit is its applicability to all systems of electrical distribution—continuous and alternating; and it is further recommended for durability, safety, convenience, and economy. The insulating lining is a non-conductor of heat, is not affected by climatic changes, and is waterproof. The Company manufactures all the necessary fittings, which are made under the improved method.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BARNES (Surrey).—For the erection of six shops and dwelling-houses on the Elm Grove Estate, Rocks-lane, Barnes. Messrs. F. and W. Stocker, surveyors, 90 and 91, Queen-street, Chiswick.

J. Watt ... £6,125 J. Edwards ... £5,535
W. Watson ... 5,975 C. R. Gurr, Chiswick ... 5,150
* Accepted.

BELFAST.—For the erection of a new City Hall, for the Corporation. Messrs. E. Thomas and Sons, architects, 7, Queen Anne's-gate, Westminster. Quantities by Mr. W. H. Stephens, 13, Donegall-square, N. Belfast.

H. and J. Martin, Limited, Ormeau-road, Belfast. £154,864
* Accepted.

BIRMINGHAM.—For erecting new dining-hall and stores at the Workhouse, for the Guardians. Mr. W. H. Ward, architect, Paradise-street, Birmingham. Quantities by Messrs. Harris and Harris, Bennett Hill, Birmingham.

F. Nicholls ... £2,735 H. Vickers ... £2,325
W. J. Whittall ... 2,725 J. Atkinson ... 2,363
R. Fenwick ... 2,690 W. Nicholls ... 2,377
T. H. Whittaker & Co. 2,600 Smith & Pitts, 420 and
W. Bishop ... 2,545 421, Mosely-road* ... 2,277
* Accepted.

BOURNMOUTH WEST.—For the erection of a building for Mr. J. Passmore Edwards, Mr. Frederick Warman, architect, Spencer House, Highbury-corner, N.

McCormick and Son ... £2,030 W. E. Jones and Son £1,738
George and Harding ... 1,842 McWilliam and Son* 1,650
W. Hoare ... 1,776
Jenkins and Sons ... 1,776
* Accepted.

BRISTOL.—For the erection of school buildings, Westbury Park, for the Bristol School Board. Messrs. La Trobe and Weston, architects, 20, Clare-street, Bristol. Quantities by Mr. W. L. Bernard.

H. A. Clark ... £2,700 F. Walters ... £2,470
H. A. Clark ... 2,595 H. Hughes and Weeks ... 2,470
Wilkins and Goshing ... 2,590 E. Love* ... 2,439
Cowlin and Sons ... 2,480
* Reduced to £2,179 ss. 9d. and accepted.

BRISTOL.—For the erection of a laundry at the infirmary, St. John's Hill, West Wansborough, for the Guardians of the Poor of the Wandsworth and Clapham Union. Mr. T. W. Aldwinckle, architect. Quantities by Mr. W. G. Edwards.

W. Whiteley ... £6,068 Kirk and Randall ... £5,535
E. P. Bullard and Son ... 6,122 W. Norton ... 5,380
S. Dockerill and Son ... 5,815 H. Wall and Co. ... 5,388
E. Triggs ... 5,780 W. Johnson & Co., Ltd.* 5,250
* Accepted.

LONDON.—For the erection of a factory at Southwark Bridge-road, for Messrs. Cropper and Co. Messrs. Cropper and Bolton, architects. Quantities by Mr. J. Rookwood, Bloomsbury, W.C.

Mattock Bros. ... £8,897 Edwards and Medway £7,933
Colls and Sons ... 8,440 S. Powell ... 7,960
Lascelles and Co. ... 8,387 Turtle and Appleton ... 7,906
F. G. Hoskins ... 8,380 E. Hoskins ... 8,470
Dove Bros. ... 7,955 F. T. Chinchin ... 7,747
* Accepted.

LONDON.—For rebuilding the girls' offices, adapting the existing offices for new urinal, improving the lavatories, and providing part new drainage scheme for old school, at the Creek-road Schools, for the London School Board. Mr. T. J. Bailey, architect.

S. Mason, Ltd. ... £1,703 5 1 G. Parker ... £1,039
J. Garrett & Son ... 1,400 0 E. Triggs and Co. ... 1,017
F. G. Minter ... 1,116 0 E. Triggs* ... 935
W. V. Goad ... 1,697 0
* Accepted.

LONDON.—For refitting girls' offices, constructing infants' urinal, altering boys' urinal, and refitting offices, and providing part new drainage scheme, at the Gloucester-grove East Schools, for the London School Board. Mr. T. J. Bailey, architect.

S. Mason, Ltd. ... £1,836 4 2 Lathey Bros. ... £1,301
F. G. Minter ... 1,395 0 0 E. Triggs ... 1,285
Stimpson & Son ... 1,390 0 0 Cowley and Drake* ... 1,257
* Accepted.

LONDON.—For enlargement and improvements. The revised accommodation of the whole school on the completion of the enlargement and improvements now proposed will be for boys, 448; girls, 448; infants, 508; total, 1,404, at the Marlborough-street School, Blackfriars, for the London School Board. Mr. T. J. Bailey, architect.

T. and H. F. Higgs ... £19,118 ... £283
B. E. Nightingale ... 18,923 ... 270
Kilby and Gayford ... 18,787 ... 220
E. Lawrence and Sons ... 18,387 ... 245
W. Smith ... 18,126 ... 264
Lathey Bros. ... 17,884 ... 261
Leslie and Co., Limited ... 17,033 ... 18

LONDON.—For erecting offices for boys, adapting boys' old offices for girls, and providing part new drainage scheme at the "Whittington" School, for the London School Board. Mr. T. J. Bailey, architect.

Samuel Mason, Ltd. ... £1,396 17 5 Stevens Bros. ... £1,227 0 0
J. Willmott & Sons ... 1,490 0 0 G. S. Williams and Son ... 1,200 0 0
R. A. Yerbury and Sons ... 1,350 0 0 Drake* ... 1,140 0 0
E. Lawrence & Sons ... 1,235 0 5
* Recommended for acceptance.

LONDON.—For improvements, &c., at the Stephen-street schools, for the London School Board. The revised accommodation consequent upon the proposed improvements will be: Boys, 330; girls, 334; infants, 400; total, 1,064 (involving a reduction of 79 places over the old school, viz.: Boys, 34; girls, 41; infants, 4). Mr. T. J. Bailey, architect.

W. Scrivener and Co. ... £16,466 ... £165
G. S. Williams and Son ... 16,330 ... 160
D. Charteris ... 16,308 ... 159
E. Lawrence and Sons ... 15,223 ... 150
Treasure and Son ... 15,267 ... 143
J. Chessum and Sons ... 14,462 ... 170
J. Simpson and Son ... 13,398 ... 145
R. A. Yerbury and Sons ... 13,455 ... 143
Leslie and Co., Ltd.* ... 13,224 ... 100
* Recommended for acceptance.

LONDON.—For erecting manual training centre for forty boys and enclosing, draining, and tar-paving the additional land at Northey-street Schools, for the London School Board. Mr. T. J. Bailey, architect.

Staines and Son ... £1,420 0 0 ... £230 0
J. Willmott and Sons ... 1,316 8 8 ... 30 0
W. Sturmar ... 1,221 0 0 ... 26 0
Johnson and Co. ... 1,213 16 0 ... 28 16
J. Grover and Son ... 1,194 0 0 ... 28 0
W. MacCormick and Sons ... 1,158 0 0 ... 27 0
F. and F. J. Wood ... 1,080 0 0 ... 33 0
J. T. Robey ... 1,084 17 0 ... 26 16

LONDON.—For the erection of four semi-detached houses, to be erected in Wiverton-road, Sydenham, for Mr. Harry Francis. Messrs. Douglas Young and Co., architects, 51, Coleman-street, City.

James Smith and Sons ... £2,600 E. J. Taylor ... £1,970
W. V. Goad ... 2,600 Newmans, Limited ... 4,968
T. R. Roberts and Co. 2,566 G. J. Kick* ... 1,878
* Accepted at £1,840.

LONDON.—For the erection of shop premises at Ladywell-road, Lewisham, for Messrs. Longstaff and Co. Mr. Alfred Roberts, architect, 18, Nelson-street, Greenwich, S.E.

R. Eke ... £1,700 R. Soper ... £1,325
A. Marsh ... 1,620 Jones and Groves ... 1,264
Kennard ... 1,600 Gerrard & Sons, Lewis-
W. Mills ... 1,449 ham (accepted). ... 1,225

LONDON.—Accepted for the erection of a new vestry, with furnace-room under, at St. John's Church, Putney. Messrs. Lee and Pain, architects, 63, Lincoln's-inn-fields, W.C.

Adamson and Sons ... £90
LONDON.—For the erection of new billiard saloon and sundry alterations to "The Northumberland Arms," Northumberland Park, Tottenham, N. Mr. J. W. Brooker, architect, 13, Railway-approach, London Bridge, for Mr. Harvey-Burman.

£2,370 Edwards and Medway £2,437
£2,340 Hibberd Bros., Ltd.* ... 2,015
* Accepted.

LONDON.—For the erection of new billiard saloon, and sundry alterations to "The Royal Albert" tavern, St. Stephen's-terrace, South Lambeth. Mr. J. W. Brooker, architect, Railway-approach, London Bridge, for Mrs. Butlin.

Edwards and Medway ... £1,393 Hibberd Bros., Ltd.* ... £1,350
Maxwell Bros. ... 1,360 Burman ... 1,335
* Accepted.

LONDON.—For the reconstruction of a pavilion and for the reconstruction of the system of drainage at the South Western Hospital, Stockwell, for the Metropolitan Asylums Board. Mr. T. W. Aldwinckle, architect. Quantities by Mr. W. T. Farthing.

Kirk and Randall ... £17,723 H. Wall and Co. ... £15,554
F. and H. F. Higgs ... 16,215 W. Johnson and Co., Ltd.* ... 15,330
E. P. Bullard and Co. ... 16,135
T. Adams ... 15,870 J. Hayward ... 15,280
* Accepted.

LONDON.—For the erection of a laundry at the infirmary, St. John's Hill, West Wansborough, for the Guardians of the Poor of the Wandsworth and Clapham Union. Mr. T. W. Aldwinckle, architect. Quantities by Mr. W. G. Edwards.

W. Whiteley ... £6,068 Kirk and Randall ... £5,535
E. P. Bullard and Son ... 6,122 W. Norton ... 5,380
S. Dockerill and Son ... 5,815 H. Wall and Co. ... 5,388
E. Triggs ... 5,780 W. Johnson & Co., Ltd.* 5,250
* Accepted.

LONDON.—For refitting girls' offices, constructing infants' urinal, altering boys' urinal, and refitting offices, and providing part new drainage scheme, at the Gloucester-grove East Schools, for the London School Board. Mr. T. J. Bailey, architect.

S. Mason, Ltd. ... £1,703 5 1 G. Parker ... £1,039

J. P. White ... 1,173 0 0 Verdon, 247, Bat-
J. Darvall ... 1,150 0 0 tarsea Park-rd.
T. F. Bros. ... 1,097 0 0 London, S.W.* ... 82 12 7
W. B. Neal ... 1,090 0 0
* Accepted, subject to modification.

WESTON-SUPER-MARE.—For erecting two pairs of cottages, Uphill Drive-road, Weston-super-mare, for Mr. E. M. Whiting, Mr. S. J. Wilde, architect, Boulevard Chambers, Weston-super-mare.

J. Solway ... £1,310 W. M. Dubin ... £1,164
Keen and Keen ... 1,590 E. and C. Stradling ... 1,100
R. Wilkins and Son ... 1,450 Antice-terrace, Wes-
G. Sprake ... 1,440 ton-super-mare* ... 1,100
J. Wilcox ... 1,310
* Accepted.

PAINTING and artistic DECORATION
WANTED. Contract or other. Town or country.
—E. HANSELL, 3, Muschamp-road, East Dulwich, S.E.

ASSISTANCE rendered by ARCHITECT.
A smart draughtsman, at his own Office. Working drawings, surveys, perspectives, &c. Terms moderate.
—7, London-road, St. Albans.

R. I. B. A. SOCIETY OF ARCHITECTS,
and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparations by correspondence or in residence. Fourteen first places.—G. A. T. MIDDLETON, 19, Craven-street, Strand, W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by Correspondence. No looks are required. For particulars and testimonials apply CERTIFIED COACH, 31, Herbert-road, Plumstead, S.E.

TO LOCAL SURVEYORS.—ASSISTANCE
in the preparation of Sanitary, Engineering, and Architectural Drawings, Quantities, Estimates, Surveys, Reports, &c., by a Firm holding public appointment, and certificated by the Association of Municipal and County Engineers and Sanitary Institute.—Address, Box 508, Office of BUILDERS' JOURNAL.

R. I. B. A. EXAMS. PREPARATION
personally or by correspondence. Any subject taken separately if desired. Exceptional arrangements for Resident Students. Architectural Lending Library, Catalogues 6d. each.—Apply to Mr. W. CHURCH HOWGATE, A.R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to British Museum).

TO ART STUDENTS.
A Travelling STUDENTSHIP of £50 is OFFERED by the PAINTERS' COMPANY for the encouragement of the Study of DECORATION.
The Studentship is open to competition by Students between the ages of 20 and 25 in any recognized School of Art, or other Institution devoted to the study of applied Art in any form and situate within the limit of the larger Metropolitan Postal area.—For particulars apply to the CLERKS, Painters' Hall, 9, Little Trinity-lane, E.C.

THE DUBLIN PORT AND DOCKS
BOARD are prepared to receive PROPOSALS to SUPPLY the undermentioned ARTICLE, from January 1st next to December 31st, 1898: CORDAGE.
Securities will be required. The lowest tender or any will not necessarily be accepted.
Tenders, addressed to the undersigned, sealed, and endorsed "Tender for —," naming the article, will be received at this office up to WEDNESDAY, the 8th day of DECEMBER, 1897.
Forms of proposal may be had at the office between the hours of Eleven and One o'clock.
By order,
N. PROUD, Secretary.

Port and Docks Office, Dublin,
November 13th, 1897.

APPOINTMENTS WANTED.
The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A.,
DESIRES TO ASSIST others
in the
PREPARATION OF DRAWINGS
at his own office.
G. SCORER, 28, Newman-street, W.

Surveying and Sanitary SUPPLEMENT.

NOVEMBER 24TH, 1897.

SEA DEFENCES.*

By RICHARD F. GRANTHAM,
M.Inst.C.E., F.G.S.

IN view of the rapid extension of seaside watering-places, and the large sums of money spent on their protection from the sea, as well as of the importance to owners of land and houses by the sea, of the protection of their property, the principles upon which such works should be constructed appear to the author to be worthy of the fullest consideration of engineers, and particularly when one remembers the diversity of opinion as to the forms which they should take. That the conditions of any one part of the coast differ from those of any other is not a sufficient explanation of the variety of forms of defence which are to be found along the sea frontage.

More than fifty years ago, at the reading of papers before the Institution of Civil Engineers, upon the question of the best form of sea walls, opinion was divided on the respective merits of upright walls, and of long stone pitched slopes following the natural inclination of the shore. The late Mr. John Scott Russell expressed the opinion that, for the purpose of reflecting waves and not breaking them, "with the best materials, best foundation, the most perfect workmanship and constant care, there is no doubt that the shape in which the smallest quantity of material will most completely resist the action of the sea is the vertical wall," and he goes on to explain that an angle of 45deg. for the outer slope of the wall would bring it within the scope of his definition of a vertical wall, and would give "the advantage that it combines in the highest degree the action of weight of each of the stones with their pressure on each other."

The form of wall more recently constructed at various points on the coast coincides with this view, although, perhaps, its suitability as a support to an esplanade may have to some extent determined it.

* A paper read before the Society of Engineers.

The rate of loss ascertained by the author at various points on the coast is as follows:—

	Feet per annum.	
Between Westgate and Margate, chalk cliffs, 30ft. to 40ft. high above sea level	2	0
St. Margaret's Bay, near Dover, loam and gravel, about 5ft. to 6ft. above sea level	4	6
New Romney Level, sandhills varying in height	8	0
Lancing Village, Sussex, ridge of shingle protecting low-lying land swept back by the sea. Average about	18	0

Other observers have found the rate of erosion to be:—

	Feet per annum.
Easton Bavent Cliff, north of Southwold, light coloured sands, laminated clay, and shelly sands 11ft. high	21 to 30
Between Eastbourne and Langley Point, rubble clay gravel	3
Between Hengistbury Head and Boscombe Chine, east of Bournemouth, light coloured sands and dark clay from 30ft. to 77ft. high	10
Yaverland and Redcliff, Isle of Wight, about	3

FIG. 1. ESTUARY OF THE NENE.

Elmer, Middleton, Sussex, part ridge of shingle, part loamy clay cliff, about 6ft. above sea level	3	0
Bracklesham to East Wittering, west of Selsea Bill, loamy clay with some gravel	5 to 8	
East Wittering to mouth of Chichester Harbour, loamy clay and gravel, from 10ft. to 20ft. above sea level	10 to 15	
Highcliff, east of Christchurch, Hants, slipping cliff about 100ft. above sea level. Sharp gravel and sand, 13ft. to 18ft. thick, overlying Barton clay	3	0

Mr. Robert Pickwell stated that the average rate of loss of land between Flamborough Head and Spurn Point must considerably exceed 2½ yards per annum.

Lyme Regis, Lower, lias clay on limestone	3	
Bridport Harbour, East Cliff, sands and calcareous sandstone	1	
Bridport, West Cliff, clays and marls Westward Ho, for about a mile in length, about	1 to 3	
Watchet, cliff, about 56ft. high, red and grey marls (Rhoetic)	30	
	4	

This loss produces littoral drift, the subject of a recent paper by Mr. W. H. Wheeler, M.Inst.C.E. The author, however, from his experience, shares the opinion expressed by other engineers, that the movement of this drift is due to the waves created by the prevailing wind of the locality, and not to the wave action of the flood tide, although in most cases its direction coincides with that of the flood tide.

Fig 2

FRONT WALL, CANVEY ISLAND.

FIG. 5. HOVE SEA WALL.

Now, the sand and shingle thus transported are the most important elements in the protection of the coast. In ordinary times, they in some degree prevent the constant fretting away of the foot of the exposed cliffs, or, when piled up in a ridge on low-lying land, check the advance of the sea. Clearly, then, the removal of this sand and shingle in large quantities weakens the natural defence of the coast line, and ought in all cases to be stopped. Thus, the author found that west of Selsea Bill, shingle was being taken for repairing the parish roads, and that barges were removing 100 tons of shingle per week from the Spit at the mouth of Chichester Harbour. By the advice of the author, the Lords of the Manor prohibited the practice. A similar custom prevailed on the Yorkshire coast, and the trade in shingle was largely developed by the opening of the Hull and Holderness railway. The Board of Trade put a stop to it, the late Sir John Coode's evidence being that "if the shingle continued to be removed the port of Hull would be endangered, and that materially so."

The artificial defences against the sea are:—

- I. The embankments which protect the low-lying and reclaimed lands, generally of earth with pitched slopes.
- II. Upright stone or concrete walls, some of which have groynes in front of them.
- III. Groynes of timber, stone, or concrete.

I. **Embankments.**—The most familiar forms of these (see Fig. 1) have, where exposed, a front slope of 4 and 5 to 1, a back slope of $1\frac{1}{2}$ and 2 to 1, and a height of from 6 to 16ft. above high water spring tides. The front slopes are sometimes pitched with chalk or stone, or, as in Holland, are protected by fagotting. The walls of the Canvey Island in the estuary of the Thames, 4 miles west of Southend, have for some years been under the charge of the author, and are typical of this kind of defence. In 1881 the sea broke into the island—its surface being about 2 and 3ft. below H.W.O.S.T.—and flooded about 1500 acres. The top level of the walls, which are 16 miles in length, at that time was about 15ft. above Ordnance Datum, and the width 3ft. The outer slope of the wall, which is 4 miles long, fronting the Thames, is faced with Kentish ragstone pitching, about 40ft. wide in the most exposed parts (Fig. 2). The author first raised the front walls to a height of 18ft. above O.D., and the back walls to 16ft. O.D., the highest known tide being 15ft. O.D. The stone pitching of the front walls was broken up and spread as a layer 12in. thick, and upon this dry stone pitching, averaging 15in. thick, was laid.

It is not known when the island was reclaimed, but the history of the maintenance of the walls commences about the year 1620, A.D. It is not likely that the stone-pitching of the front slope was undertaken all at once. The probability is that the front wall was first formed, as is usually the case, a little distance from the margin of the saltings, the edge of which is generally broken and fretted away

by the action of the waves, a mud-covered slope being left in front. As this broken edge approached the foot of the front slope it was probably sloped back and pitched with stone with a row of oak stakes driven in at the foot. Waves rolling up and down this slope would immediately begin to scour out the mud at the foot and undermine it; the pitching would then be added downwards with another row of oak stakes at the foot. This process would be continued until the foot of the slope had reached its present level of about 8ft. below H.W.O.S.T.,

or 8ft. above L.W.S.T. The slopes now have inclinations of from $3\frac{3}{4}$ to 1 to $4\frac{1}{2}$ to 1. But in order to prevent further scour, low stone-pitched groynes were run out at right angles to the front line, and these groynes at the present time cause some small accumulation of drift, sufficient to prevent further undermining.

The well-known Dymchurch wall from its exposed situation, is an exception in its form to the class of sea defences now under consideration. It was formed at a time when the discussion already referred to, on long slopes and upright walls, was proceeding. The inclination of the sea slope was 6 to 1, 7 to 1, and 8 to 1, terminating at the upper end with a curve of 7ft. radius in an upright wall, the top of which is about 10ft. above the H.W.O.S.T. The breadth of the stone-pitching when first laid was about 130ft., the lower end being about 7ft. above L.W.S.T., or 14ft. below H.W.O.S.T. Further reference to the present state of the wall will be made under the head of groynes.

There are, so far as the author is aware, few earth embankments of reclamation areas faced with upright sea walls of any great length. Recently, however, he had to inspect and report upon the defences of the Caldicot Level, which is under the jurisdiction of the Monmouthshire Commissioners of Sewers, at the mouth of the Severn. The defences fronting the river, which is there about five miles wide, consist of the usual earth embankment faced for a continuous length of six miles with stone walls more or less upright. Owing to the circumstances in which they have been built these walls present almost every variety of profile, from a slope of 2 to 1 to the perpendicular and curved. The section varies every 200 yards, and sometimes less; some walls are from 2ft. to 3ft. higher than those adjoining them, the general height being from 12ft. to 14ft. above the shore level. The rise of spring tides is 38ft., and high-water mark is within about 3ft. of the top of the lower walls. In storms, however, the surge of the waves frequently overflows. The base of the wall is bedded on the rock of the foreshore, but although it resists scour to some extent, it has been found necessary to form a broad apron of dry pitched stone in front of the foot of the

wall to prevent undermining. The walls were much damaged by the storm of October, 1896, and again in March, 1897.

II. **Upright Walls.**—The prevailing practice at watering places in recent years, where a coast is exposed directly to the sea, has been, as already observed, to build walls more or less upright. But there is no uniformity in the profile of the face. At one place it is nearly perpendicular, at another it has a batter of one or two inches to the foot or more; sometimes it is curved more or less; and occasionally it is built up in steps. But while the form may be such as to aggravate mischief at the foundation, damage to, or the destruction of a sea wall, is not generally directly due to its form or to the want of thickness or inherent strength of the wall, but to undermining.

As soon as a wall is built on a coast exposed to heavy seas, the sea at once begins to scour out, first the drift lying upon the shore, and then the material of which the shore consists. With a perpendicular or slightly inclined face, the waves during the storms, suddenly checked in their advance, shoot up it, or over the top, volumes of water, which falling back draw with them as they recede, the sand and shingle at its foot, which are then by the following waves carried away to leeward. On a more inclined slope of 1 to 1 or 2 to 1 (see Fig. 3) the waves running up and receding scour away the materials at the top of the slope. Where there is a sharply curved face, especially when a nosing is added or the coping projects, the wave rises up and is thrown violently back on the shore at the foot of the wall. The result in each case is a general lowering of the level of the shore so that deeper water is brought up to the wall. Unless it is founded on hard rock, or protected by groynes, its foundation will be undermined, and its destruction is only a question of time.

The author's firm built a sea wall at Westgate, Kent (see Fig. 4), where the shore and cliffs are of chalk. The chalk on the shore appeared hard, and was covered with seaweed. The base of the wall was built 2ft. deep below the shore level. But in two or three years it was found that for some yards in length the foot of the wall had been undermined, and the chalk scoured out about 6in. The remaining lengths of the foundations were built 4ft. below the shore level.

Mr. Ellice-Clark mentions the case of a wall he built at Ramsgate, where the curve of the face was made too sharp, with the result that the chalk foreshore was speedily undermined. At Blackpool the cliff on the frontage was sloped down to an angle of about 50 degs. and paved with stone. Scour caused by the run of the waves up and down the slope immediately commenced, and the stonework was undermined. The foundation was carried lower down, thereby increasing the scour, and the stonework had to be carried still lower down. The result was a permanent lowering of the shore, and an increased depth of water, giving greater power to the waves.

At Brighton and at Hastings, in order to protect the front walls, the corporations have found it necessary to build large and costly concrete groynes. At Hove, too, the fine esplanade wall (see Fig. 5), built by the late Sir John Coode and Mr. Ellice-Clark, is protected by short timber groynes, without which the wall probably would not now be standing. But from the scarcity of the supply of shingle

FIG. 4. WESTGATE.

travelling along the frontage—the bulk of it having been trapped at Shoreham Harbour, and by various groynes to the westward—difficulty was experienced in keeping the bays formed by the groynes sufficiently filled.

The damage to and occasional destruction of parts of the Seabrook wall between Hythe and Sandgate arise from the same cause—the liability of the stratum in which it is bedded to scour—and the short timber groynes subsequently added have not altogether remedied the mischief.

(To be continued.)

THE new system of “septic” treatment at Exeter is described by Mr. Cameron, the city surveyor, in a paper read before the Devon and Exeter Architectural Society. It is claimed for this system that the sewage treated by this process in the tanks is brought under the influence of micro-organisms; the decomposition of the matters which would otherwise undergo putrefaction being effected by the presence of these micro-organisms, their products being ammonia and carbonic acid with some other gases. The bottom of the tanks after six months’ use, when exposed, showed only a thin layer of black earthy matter, together with mud and grit. The effluent is not offensive, and it is stated that it does not ferment. At Wolverhampton recent experiments have shown that filtering the sewage through coal-dust is an effectual way of purifying it, and that a very satisfactory effluent can be obtained by passing 200 gallons of sewage through one square yard of filtering material in 24 hours.

Not a few provincial sanitary inspectors and medical officers of health, are, says the Globe, much given to the practice of shutting the stable door after the steed has been lost. When an outbreak of some terrible epidemic occurs they are as alert and energetic as need be, but in too many cases the grossest and most palpable insanitation is ignored until then. There would be very little difficulty in citing a number of instances precisely similar to one mentioned in the last report of the Erdington Health Committee. Four deaths from diphtheria having occurred at a cottage, official inspection was at once ordered. Here is the description of the premises: “Cellar wet, spouting deficient, sink drain defective, water polluted; pigs in a filthy state, kept in out-houses against the cottage; unpaved yard occupied by a large number of fowls.” In this vile place a large family lived, without caring for the ever-present danger of death, until four of them were swept away. But, surely, with such a multitude of well-paid officials entrusted with the conservation of public health, it ought to be someone’s duty to ferret out such veritable “homes of diphtheria,” as the medical officer of health styled them.

Surveying and Sanitary Notes.

FOR some time past the contractor for the sewerage works of the East Stow Rural District Council (Mr. F. Plummer, of Rattlesden), has met with considerable difficulty in carrying the pipes of the East Stow Sewerage Disposal Works across a piece of boggy meadow land at the back of the Stowmarket Gas Works, and adjoining the Great Eastern Railway. It was proposed to erect a pumping station at this spot to carry the sewage up to the Sewage Farm, but no sooner had the foundations been dug, and the walls of the building commenced, than it was found that the water came in with great rapidity, and it became necessary to employ an engine to pump the water into the river. With great difficulty the trenches were dug, and the sections of

pipe, each weighing some 30cwt., got into position, these having to be supported on wood staging to keep them at a proper level in the bog. A strata of shifting sand was struck while the work was in progress, and in spite of strenuous efforts on the part of the contractor, the obstacle has proved too much for him; the foundation of the pumping station gave way, and the sides fell in the water, at once rising to the level of the meadow, so that trenches had to be cut, and the water and sewage matter now finds its way through an open ditch into the river. It was finally decided to suspend operations, and the engineers (Messrs. Tayler, Son, and Santo Crimp), are to decide as to the future position of the pumping station.

MR. W. H. CASMEY, in a lecture before the members of the Yorkshire College Engineering Society on “Warming and Ventilation,” said that wherever a number of people were

gathered together in a building there should be a constant flow of fresh air, in the proportion of 3700 cubic feet for each person, and it was only by such a quantity being supplied that normal death rates could be obtained. There was reason to believe that the time would come when every building throughout the kingdom would have a mechanical method of warming and ventilation. A consideration of the facts on record led him to form the opinion that the contagiousness and the non-contagiousness of pulmonary consumption varied in direct ratio to the amount of air space and of free ventilation of air in the dwellings of the people. Previous to the Army Sanitary Commission, nearly forty years ago, the cubic space per soldier in the barracks of the Foot Guards was 331 cubic feet, and the mortality from lung disease was nearly fourteen per 1000. In the Horse Guards, on the other hand, with now space per man equal to 572 cubic feet, the death rate was seven per 1000 from the same disease. The air space

Fig. 3.

had been increased to 600 cubic feet per man, and the death rate from lung disease was three per 1000. In ventilating a building care must be taken that the air introduced was properly warmed. It was impossible to either study or work to the best advantage in a low temperature, the reason being that the corporeal heat or energy, instead of being devoted to its work, was taken away by the cold. Schools, mills, and works should be properly warmed before the scholars or workpeople were allowed to enter them. If this were done a very short time would prove that the step taken was a right one. Mr. Casmey proceeded to describe the installation recently applied by the Blackman Ventilating Company to the Royal Technical Institute at Peel Park, Salford. The building contained about 1,000,000 cubic feet of air space, and the plant applied was of sufficient capacity to supply 4,000,000 cubic feet of air per hour, which was equal to supplying over 1000 students with 3700 cubic feet.

An Architectural Causerie.

Wanted—Meat. There are many unquestionable signs of a revival of Architecture. A transitional period of doubt and vacillation has just been passed through, and now the germs of a very real and active life are visible, based on a solid undergrowth—the growth of applied design—which has been the wonder and the pride of the last decade. This is exactly as it should be, as it has been in all true Architecture of the past. It is the spirit in which the Gothic and the Renaissance were alike conceived. The craftsman first—the artist in stone, or wood, or jewellery—and then the architect, applying the principles which have proved successful in the smaller crafts to great monumental works, and always, if the development has been true, with absolute success. Ten years ago the crafts were only just awakening; now they are awake and living. In all small things design is beautiful and workmanship is true; and, more than this, the design is fresh in inspiration, free from copyism, almost free from tradition, founded on broad, general principles, and its ornamentation culled from Nature by a process of investigation the most minute and painstaking. Now, at the end of this decade of apprenticeship in smaller things, the same spirit is slowly but surely, and most hopefully, creeping into Architecture, the leaven of truth in design implanted originally by Morris and his co-workers reaching last of all the great constructive Art; and rightly last, as by its aid alone can the most permanent monuments of the aspirations of our generation be handed down to posterity, and such monuments were not possible till the principles were fully understood and the details mastered. Architecture is to-day much in the position occupied by the crafts ten years ago, with this exception, that it has its natural leaders in the carefully organised societies of London and the provinces. To these leaders the appeal goes forth for help and inspiration in the great work of revival. The cry is for meat—good, wholesome food for the mind and body, and even the spirit, architectural; in response, little save dry bones are provided, the bones of archaeology and construction. At the Institute, the Association, and the Society alike the discussions and the teaching are all of what is dead, not of that which tends to life; and naturally the provincial bodies in the main follow their metropolitan leaders. Certainly Mr. Rimington at one time tried to bring the study of true principles into prominence at the Society, but that is many years ago, and he suffered the fate of most of those who are before their time. He spoke to deaf ears then, while now he would be listened to with eagerness by the many who are seeking just such inspiration as he, an artist and not an architect, was eager to instil. Are there no others to continue this much-needed work now, and show that he but sowed seed in the autumn which was to bear leaf in the spring, and fruit and flowers in the summer? If the Institute will not give what is wanted, will the Association? and if not the Association, will the Society? Programmes are not yet full.

There is yet time to provide us during this coming session with something more helpful to the growth of Architecture than accounts of the causes which led to disastrous fires in foreign capitals, or to dissertations upon the second-rate Renaissance Architecture of a solitary island. True it is that true Architecture cannot be forced, that it must grow; but in order that it shall grow healthily it must have good food, and the cry is loud for meat.

G. A. T. M.

The Site of the New Chapel.

ONE day towards the end of August the "melancholy one" strayed across the common in the direction of the large pool. It was at the further side next the village of Coothampton. After some half-hour's walk along the path, skirted by chesnut trees and undergrowth, he caught a glimpse of the shining disc of water down the vista of foliage that met overhead in close embrace. Coming into the open, the "melancholy one" stood meditatively on the upper edge of the pool, watching the

by their owners, who shrieked and yelled like so many savages as they chased each other round the grass-circled water. The "melancholy one" turned away and passed on to the oak paling that fenced off the Roman Catholic Church. Just behind the palings was a narrow plantation of cone-bearing trees, the long trunks rising almost vertically above the fence, their branches spreading and bursting out into more generous masses of dark green leaves toward the tops. Enough of the church was seen through the plantation to suggest foundation, and give reality to the airy turret, which might, if fancy led, be some dainty handiwork of fairy craftsmen hung just above the surrounding tree tops. A little to the right of the fence were a number of labourers removing the turf and bushes, a few scaffold poles and ropes near at hand suggested the erection of a new building. To find whether this was so, "the mildewed one" made a move towards the men, but noticing a sign-board upon that side of the site furthest from him, thought it possible that the board would give the information desired. With hesi-

CENTRAL SCULPTURE HALL, THE NEW NATIONAL GALLERY OF BRITISH ART. SIDNEY R. J. SMITH, ARCHITECT

swallows as they darted to and fro, mirrored in the translucent grey of the miniature lake. The ground sloped away from where he was standing to the inner edge, which rose about a foot above the water line. Midway between the water and where the grassy slope joined the common were numerous little circles of clothing dotted about, thrown off carelessly

tating footsteps, that seemed undecided as to whether their owner should speak to the men or let the board speak to him, he drew nigh. In large white letters upon a black ground were the following words: "This is the site of the New Wesleyan Chapel. Subscriptions towards the building fund will be thankfully received by the Rev. T. Priarde, D.D."

Poor "mildewed and melancholy one"; here were words that heralded the destruction of his beautiful scene which hitherto the hands of man had enhanced, but now this signboard told another tale:—"A New Methodist Chapel." It was enough. Burying his head in his hands the inexperienced youth fled, scarce heeding how he covered the ground. He stumbled; and, alas, the yawning pool at hand received his troubled spirit, for there were no friendly savages at hand to help. About fourteen months later, when the evening mists were beginning to creep across the common, and the brown leaves were still falling, faintly tapping the branches as they swayed and fluttered to the ground, another signboard might have been noticed fixed against the new chapel wall, for the building was finished, and flaunted its characterless carcass near the plantation of trees. The new signboard gave out that "To-night there would be held a tea-meeting on behalf of the debt incurred in the building of our new chapel. Tickets sixpence each. Apply to the Rev. Priarde, D.D., pastor of this church." Lights begin to flicker behind the cathedral-tinted glass, and the sound as of cups and saucers rattling came through the open portals. Truly, as the unfortunate youth foresaw, this would have been no sight for such as he who claimed acquaintance with the gods. He chose the better part—died while young, and went where chapel builders cease from troubling and pastors are at rest. G. LL. M.

Misguided Philanthropists.

ANYONE who has lately crossed Waterloo Bridge will have noticed that the proprietors of a certain brand of wine have built themselves a warehouse, close to the bridge, with a river frontage, on which is displayed a gigantic illuminated reproduction of their label or trade mark. Over this is a semi-circle of electric lamps, which are alternately extinguished and re-lit. This is the last, but by no means the least of those electric street devices with which we are becoming familiar. They beautify Charing Cross, they lend an added charm to Piccadilly Circus, they enliven the junction of Oxford Street and Tottenham Court Road. To the man of imagination they recall memories of the "Thousand Nights Entertainment," of the geni of the magic lamp, of brilliantly lighted halls, of dark flashing eyes, and the tinkle of the feet of the dancers. But when we are abroad on the serious and practical business of life, we care for none of these things. To mingle pleasure and business is against all the principles of the commercial mind; so these well-meant efforts to brighten us up are only thrown away. They are not appreciated. The Italian musician, with his reminiscences of the sunny south, grinds to unwilling ears. If the citizen wants fairy lamps, he goes to Earl's Court; if he wants fireworks, to the Crystal Palace; so why not take these illuminations, and group them artistically at one of these popular pleasure resorts? Massed together, they would have a magnificent effect. They could be switched on and off, in sections or all together, to the tune of the brass band; the little lights could run up and down, and in and out, and round about, in quite a bewildering manner. It is inspiring to think of the effects that might be produced by a skilled operator—a real artist. At the close of the evening a grand set-piece might be arranged. In a framework, giving the names of the various drinks, condiments, and quackeries, that most do comfort our souls, might well be spelled out, in the largest of letters, this single, but most appropriate word, "Philistines!" The County Council had once a word of advice to offer to certain misguided

philanthropists, who wished to relieve the bald outlines of so many of our buildings by erecting "sky-signs." Perhaps it recommended them to give the money to the hospitals, or to pay for the L.C.C.'s municipal palace; anyhow they have ceased to spend it on "sky-signs," much to our content. Cannot the same authority venture on a little paternal advice in this case? It might possibly see in it such a chance to increase its popularity as does not often come in its way. Here are certain benevolent persons who are anxious to light the streets for us. Why not let them do it and abolish the lighting rates? The movement only wants proper direction. Why not work out a grand comprehensive scheme for the lighting of London by electric glow lamps: who so fitted to direct this as the L.C.C.? There might, however, be some little difficulty in inducing our benefactors to cease their individual efforts and combine in a general scheme. Such men are always of a sensitive conscience, and their scruples must be respected. To hide their candle under a bushel in flat defiance of the commandment, however great the practical advantages, is more than they can bring themselves to do. Perhaps we ought not to ask it of them. At a time like this, when humbugs of all descriptions abound in the land, it is as well that credit should sometimes go where credit is due. If "Gaslight" soap illuminates Charing Cross, why to "Gaslight" be all the glory. But would it not be possible, without appearing ungracious, to suggest to these public-spirited men that the result of their efforts have certain disadvantages; that these alternating illuminations sometimes worry the eye and jarr on the nerves of sensitive people. That a notice in different coloured lights that jumps from red to green and from green to red at intervals of about a second and a half, with an appalling monotony—just sufficient pause between each change to make you wait nervously for the next—has something of the same effect on the brain as the continual dropping of cold water on the head. This way madness lies. Nothing grieves a philanthropist more than to find that his unselfish devotion to the public welfare has been productive of more harm than good. Considering the strain of our city life, and how greatly nerve disorders are on the increase, is it wise to put an extra burden on already overwrought nerves in a Quixotic endeavour to improve the lighting of the streets, or to amuse us when we don't want amusement, especially when the same objects could be obtained without any of the present disadvantages? If these benevolent people would only consent to sink their sense of abstract justice and unite in a common effort for the public good, surely it would be accounted to them for righteousness. Charity covers a multitude of sins. How restful the effect of a simple line down the street compared with these conflicting and irritating spots of light; and if it is desired, as doubtless it is, to lighten our spiritual as well as our earthly footsteps, how much better than the present hieroglyphics—to which the mind can attach no moral—would be the high-toned sentiment which seems to have inspired this unselfish action, "Let your light so shine before men that they may see your good works"—a command which we are all of us just now rather too apt to forget. But should this be considered a counsel of perfection, which, by aiming too high, will miss the mark, why not the mingled wit and wisdom of this, one of those pithy, homely proverbs which have made us what we are: "Early to bed and early to rise, is no use unless you advertise?" The L.C.C., ere it hurries to the annihilation so benevolently predicted for it by Lord Salisbury—ere its own light flickers out—might try to bring about the same result in these flagrant instances of the abuse of advertising. A. R. J.

THE LONDON BUILDING ACT.

IMPORTANT AMENDMENTS.

THE London County Council has determined, upon the recommendation of its Building Act Committee, to apply to Parliament next session for some important amendments in the London Building Act, 1894. In a report upon the matter the Committee point out that recent decisions in the High Court, as to the construction to be put upon certain sections of the Act, are such as appear to render the working of the Act as it stands very difficult. The first point in which amendment is desired is with reference to the procedure in the case of dangerous structures. Some delay appears to have occurred, owing to a recent decision of one of the magistrates, as to the service of the necessary summonses, in which he held that service by affixing a copy upon the premises was not sufficient unless the Council had, after some reasonable inquiry, failed to find the owner. The High Court, when applied to for a *mandamus* to the magistrate to hear the summons with which he had declined to proceed, decided that if the Council made reasonable inquiry, and could not discover the owner, a summons could be served by affixing a copy on the premises, but discharged the *mandamus* on the technical ground that no evidence was given before the magistrate that such inquiry had been made. The Committee think that that decision will put

A SERIOUS DIFFICULTY

in the way of proceedings, as it must involve in each case a search for documentary proof of the ownership of premises before a summons can be taken out, as without evidence of ownership—to get which evidence must, in many cases, be impossible—the case might be dismissed, with costs against the Council. They consider it essential that structures certified to be in a dangerous state should be dealt with with the utmost promptitude, and this will, they say, be impossible if such inquiries, which have never hitherto been required, have to be made. In illustration of the necessity for swift action, they state that only a very short time since, owing to a magistrate having refused to adjudicate upon a case, in consequence of a point raised as to the service of the summons, two men narrowly escaped being crushed through the falling down of part of a structure certified to be dangerous. The Committee are of opinion that the section of the London Building Act dealing with the matter should be so amended as to make it clear that in all cases of dangerous structures all documents in proceedings may always be served on some person on the premises to whom such documents relate, or, if no person be found on the premises, by affixing such documents thereto. An amendment of Section 14 of the Act is also to be asked for, in order to make it clear that no part of any new building shall be erected with its boundary fence or wall at less than the prescribed distance from the centre of the road. An amendment of another section is desired to make it clear that no working class dwelling shall be erected within 20ft. from the centre of the street or way on which it abuts. Amendments are also to be asked for in relation to the clauses providing that penalties for certain offences under the Act can only be enforced when an order of the magistrates is not complied with.

SIR ALFRED MILNER has laid the foundation stone of the new public library of Bulawayo.

For the construction of the new Wesleyan chapel about to be erected at Bournemouth, according to the designs of Mr. R. Curwen, Hamilton House, Bishopsgate Street Without, the tender of Messrs. F. Hoare and Sons, at £2268 10s., has been accepted.

The Midland Railway Company has under consideration a scheme for the construction of a central station in Sheffield. The enlargement of the present Midland station, and the doubling of the main line for several miles, cannot, however, be delayed any longer.

Men Who Build.

No. 51.

MR. SIDNEY R. J. SMITH, F.R.I.B.A.

IN continuation of our series of "Men Who Build," we now propose to consider the work of Mr. Sidney R. J. Smith, F.R.I.B.A., whose name has become familiar to most of us as the architect of the noble pile of buildings which, owing to the munificence of Mr. Tate, have been erected on the site of the Millbank Penitentiary, and on July 21st last were handed over by the Prince of Wales to the British Public for ever.

Mr. Smith's offices are situate in York Buildings, Adelphi, in an ideal position overlooking the Embankment Gardens, a quiet spot within a stone's throw of York Stairs—that fine old relic of the art of Inigo Jones, which is now being used by an ever economical County Council as a storage place for gardener's tools. The Adelphi has of recent years become quite a rendezvous for the architectural profession, who are gradually taking the place of their legal brethren.

Many years have now elapsed since Mr. Smith commenced his professional career in the office of Messrs. Coe and Robinson, whose practice was at that time a very extensive one, including the carrying out of the vast building operations at Olympia, several hospital works, and buildings at Rugby School and Wellington College. On the decease of the senior partner, Mr. Smith, who had previously been associated with Mr. Coe in many works, added to and completed the large Poor Law Schools at Norwood.

In these days, Mr. Smith was an ever enthusiastic and diligent student of Architecture, and still recalls with much pleasure his many travels both in England and abroad in search of beautiful buildings, the fruits of which study are very apparent in the many works on which we find him engaged to-day. Architectural students had not then nearly so many facilities for study that they possess now; true, the Architectural Association was in existence 20 years since, but it was a very different institution, being conducted more on a system of mutual help than one of instruction by professors; and Mr. Smith was, at one time, the secretary of the Colour Decoration Class, a branch of work in which he still takes a great interest, and the knowledge gained from the study of colour he has been enabled to put to some use, subsequently, in the decoration of St. James' Church,

Kennington. During his student days he was the fortunate recipient of many prizes at the Architectural Association.

Mr. Smith's practice has been principally one of public buildings, although domestic buildings form by no means a small item in the list of works he has executed. Besides the Poor Law Schools at Norwood, he was architect for an infirmary, probation wards, lodges, &c., for the Lambeth Board of Guardians at Norwood, and outdoor relief stations at Stockwell, Kennington, and Norwood.

Mr. Smith can certainly not complain of any lack of variety in the work which it has fallen to his lot to execute. He has had a hand in many branches of Architecture. Of churches we have several examples from his hand, notably St. James's Church, Kennington, Worthing Church, St. Crispin's Church and vicarage, Bermondsey, Studley Road and Stamford Street Chapels, and another—the new Church of St. Thomas, Telford Park—is shortly to be commenced. Mr. Smith has had some considerable experience in the planning of libraries. The first one designed by him was that at Norwood, erected in 1890, to be followed by those at Kennington, South Lambeth, Brixton, Streatham, and Balham, this latter being now in progress. The libraries at Kennington, South Lambeth, and Brixton were the gift of Mr. Tate. In the competition for the Cripplegate Institution, Mr. Smith was, on the recommendation of the assessor, Mr. Macvicar Anderson, awarded the premier place, and we hope the day is not far distant when we shall have the pleasure of seeing this building completed.

It is, however, as we have previously mentioned, in the Tate Gallery that we may see Mr. Smith's principal work, and this we now propose to briefly consider.

The building was a gift to the nation by Mr. Henry Tate, J.P., and it is perhaps within the memory of most of us the many difficulties about the site which so nearly caused

the donor to reconsider his gift. After having prepared several designs, the building was commenced about September, 1893. Extensions of the galleries are now being carried out, which, when completed, will more than double the present hanging space. The architectural style of the building is free Classic, with a Greek feeling as to the mouldings and ornamentation. The chief feature of the front elevation is the lofty central portico of six Corinthian columns, with pediment over. This portion projects some distance beyond the main face of the building, and has a bold flight of steps up to the entrances. At the extreme ends of this front elevation are two pavilions, each having an order of Corinthian pilasters raised on pedestals, between which are deep niches with an Ionic order of columns and pilasters supporting entablatures with semi-circular arches over. Considerable relief is given to the front elevation by the plain ashlar wall-space intervening between the end pavilion and the central portico. A rusticated basement running entirely round the building supports a pedestal treatment, from which the various orders of columns and pilasters spring. The whole of the ornamentation was modelled *in situ*, a plan which, where practicable, is of undoubted value. At the top of the main pediment is a figure of Britannia, whilst on either side rests a lion and unicorn.

In the interior are seven picture galleries, the largest of which is about 60ft. by 32ft.; the two flanking pavilions are treated internally as octagons. The entrance leads to a rectangular vestibule, with an Ionic order of columns running round the sides, with banded rustication between them; the ceiling is a plaster barrel vault, with panelled stone ribs springing from the Ionic entablature over the coupled columns. From the vestibule is entered a corridor which surrounds the central octagonal sculpture hall. A very pleasing feature is a circular Belvedere, with central fountain and drinking fountain on either side. We are enabled to give several illustrations of the building which have not hitherto been published.

Mr. Smith is now carrying out several houses in Park Lane, W., and close by, in Green Street, Park Lane, he is erecting a large Georgian town residence for the Right Honourable Lord Ribblesdale.

TATE LIBRARY, STREATHAM. SIDNEY R. J. SMITH, ARCHITECT.

REPAIR AND RESTORATION.*

BY THACKERAY TURNER.

MY chief object will be to try and explain to you what I have gathered about the different methods of repairing buildings whilst working for the Society for the Protection of Ancient Buildings. At the same time I am fully aware that words are of little value, and if I could but show you some actual work going on, it would be far more useful to you than anything I can say. Indeed, I should like to go a step further, and say that anyone actually carrying out a piece of work of repair would learn more than any amount of papers and examples could teach him. We cannot discuss the subject of restoration without considering what the word seems generally to mean. I take it that restoration means making new work to take the place of old, that is to take the place of existing old work which is partly

craze for restoration? The restorers often say to me, "We are only doing exactly what the old builders would have done." But did the old builders ever restore? I think it will be found that if work of a previous generation was in their way they chopped it out of their way, and had no hesitation in putting up their new-fashioned work cheek by jowl with the work of their forefathers, but the work which they did leave they left entirely untouched. The restorers leave nothing untouched—they go over the whole. How strange it seems that the architects of this century, if I may say so, seem to be fully convinced that they can greatly improve any mediæval building that is entrusted to their charge. It is quite appalling to go over a house or a church with the owner or the parson. Scarce ever do you find them admiring their possession with a reverent wonder, but always asking themselves and you how it can be improved. I am quite sure of one thing, which is that if you wish

restored building is better than an entirely new building accurately copied from what is called the old design. You certainly will never get the human quality in a work which is a mere copy. I do not believe that mediæval buildings were merely a kind of happy accident, but the men who made them did not work with the sole idea of being accurate, and, therefore, the workmanship of every part is full of interest. They were skilled workmen, who took a pleasure in their work, and thoroughly understood what it was they were making. The workman had a choice as to how he should work, and, supposing it were stonework, he could work half-a-dozen stones, each of which would be different, and yet anyone of the six fit for an intended place. Not so our workmen, who must work from moulds and templates, and who differ not greatly from good machines. Now supposing we architects take all this into consideration, I believe it will result, first of all, in our

CRIPPLEGATE INSTITUTE. SIDNEY R. J. SMITH, ARCHT.

decayed, or to take the place of old work which is supposed to have existed. If restorers act truly to their principles, this is what they do; but, as a matter of fact, it seems they allow themselves a far greater latitude. They design new seats and roofs, pulpits and altar rails, add vestries and organ-chambers, and call it all "restoration." The only true restoration possible is when a thing which actually exists is put back into its original place. Therefore, we will confine the word "restoration" to this meaning, and speak of our work as repairs and additions, and these works should be done in an entirely different spirit from that in which the restorers work. Here, perhaps, we may make a digression, and ask the question how it comes about that in our days there is this

work to be appreciated you should go to the men who make it. Perhaps another reason for the existence of restoration is that architects and those interested in their work have looked upon Architecture merely as a matter of design and composition. They have failed to find out one of the elements in mediæval Architecture which gives it its charm—namely, what may be called, for want of a better term, the human quality. Perhaps the best way to suggest to you what this quality is will be to ask you whether you find the reproduction of a Gothic design gives you the same pleasure as a veritable mediæval building? I feel sure you will say a restored building—that is, one which has had some defective stones replaced by new stones, and all incomplete designs completed in new work, has less interest than the unrestored building, but, to my mind, even this comparatively uninteresting

paying special attention to the texture and colour, or, in other words, materials; that we shall refuse merely to copy, and that we shall make it our aim to build well, and to the point, giving others working under us and with us as much liberty as possible. The final result of this course will, I believe, be that the love of restoration will die a natural death. Indeed, it is by some such course as this alone that our salvation in Architecture can come. The question of restoration appears to me to be mixed up so closely with the carrying out of new buildings that one cannot be considered without the other. There has been such a demand for restoration that it has naturally led us to concentrate our attention upon mediæval work, and necessarily to study it from an archaeological point of view. It has, in fact, trained us to be copyists. Now copying, except in the intelligent way of study,

* A paper read before the Birmingham Architectural Society on Friday, November 26th, 1897.

is fatal to Art; and it must be so, for a copyist does not surpass the work he copies, and if you could have a copy of a copy, of a copy it would certainly retain but few of the merits possessed by the original. It is impossible for us archi-

those working on the building, or the majority of them, are interested in the work. I felt this very strongly a short time ago when superintending the erection of two buildings not far apart. In the one case a clerk of

place by being told to speak to the foreman. And if I spoke to the foreman of the special trade, the head foreman seemed to consider I was unduly interfering, and in every case the clerk of works seemed to think his authority

NEW NATIONAL GALLERY OF BRITISH ART. SIDNEY R. J. SMITH, ARCHITECT.

itects to produce fine work merely by producing fine drawings, no matter if all the details are drawn full size. The human quality, which is absolutely essential if the building is to be of any interest, cannot be obtained unless all

works was employed, and then there was the builder's general foreman on the job, under whom there was a foreman for each of the trades, and if I spoke to any of the men, who were in fact simply hands, I was put in my

was being weakened by my not expressing my wishes to him. A more hopeless state of affairs could not well exist. It was like a dumb and blind man having to build by the aid of an interpreter. In the case of the other

ENTRANCE VESTIBULE, NEW BRITISH ART GALLERY. SIDNEY R. J. SMITH, ARCHITECT.

building everything was different. I got to know most of the men, and could talk to them about the work and about outside matters, and a joke did not come amiss. The workmen themselves made suggestions, and everyone seemed interested in the building. This, of itself, has a most stimulating effect on one. Having a key of the hoarding, I could study the building during non-working hours, and on a bright winter Sunday morning, upon slipping in to have a quiet look over the work with a good light, whom should I find there but the foreman who lived many miles out of town, and had come up on purpose with the same object as myself. Mistakes were made in this building, and we all know they must be made, but the overcoming of the mistakes led to deviations which I think in themselves proved of interest. But I will not weary you by pressing this point further, but will turn to the subject of repairing buildings. What I have said already directly bears upon this question, for a building cannot be repaired by drawings and specifications alone. The individual skill of the workmen largely comes in, and, indeed, drawings and specifications are of but little use, except in so far as they make you think the matter out beforehand, and explain the general drift of the way in which you intend to attack the building, to those whose skill has to carry out the work. We will now take into consideration the question of how repairs can and should be executed. The action which my Society took with regard to Peterborough Cathedral has been so publicly discussed, that I think it would be unreasonable for me to ignore it, and now the heat of the battle has passed, I may be allowed to speak about it without exciting

strong feelings. You are doubtless aware of the method which was laid before the authorities for rendering the structure secure, and I will therefore describe in detail how a building in a most critical condition has been dealt with in a similar way and made absolutely secure, quite recently. When I was first called in to inspect this building by the owner, I confess that it seemed to me a very bad case. Of this you can judge for yourselves when I tell you that, owing to sand being unobtainable in the neighbourhood, the mortar appeared to have been made simply of chalk. Be this as it may, it was found that wherever we could get at the core of the wall (and this could be done with safety at the window-sills) the stones could be lifted out and the so-called mortar could be bailed out with the hands. But this is not all, for the outer face of the wall was built of chequers of stone filled in with flints, but the stone chequers did not bond over one another more than an inch, and in many cases they did not bond at all. To add to this there seemed to be distinct signs of failure in the foundations. The method of arresting the disintegration of the walls up to the present time had been to put iron plates on the inside and outside, and bolt them together with small iron rods, but this was not proving successful, and the core of the wall was far too rotten to make the method safe. Fortunately the owner was a man who had had

PRACTICAL EXPERIENCE OF BUILDING

all his life, and could follow the explanation of the proposed method. He saw, moreover, that the only alternative to the proposal was to pull the walls down and rebuild them, and

then, of course, the chequered face work could never be rebuilt as the old builders had left it, and yet it was the antiquity of this magnificent old Elizabethan house which had been one of the great inducements which had led him to buy the property. You will gather that he decided to follow our recommendation, and as I had the privilege of being allowed to see the work whenever I liked, I will do my best to describe it to you. The foundations have been made substantial and sound by the old method of underpinning, and the walls of the basement, ground, and first floors have also been made thoroughly substantial and sound, and only the top floor remains to be done. In coming to details, we will leave the underpinning of the foundations, which was skilfully done (because everyone knows, or should know, about underpinning), and describe to you the first piece of work which I saw done. There was a pier between the entrance door to the cellar and a window, over which the dining-room chimney stack rose, and therefore, as you can imagine, there was considerable weight upon it. Before attacking this pier the core of the walls on either side had been renewed. This, it must be remembered, is an important point when carrying out this method of repair. You must not cut into the weakest part of the building, but begin at the sounder part and gradually grow up to it with sound work. The pier I have instanced was strutted up wherever a good hold could be obtained without cutting into it, and what seems to me important is that the face of the wall was supported by planks at intervals with shores up against them. The men began from inside at the bottom and slowly removed

THE CORE OF THE WALL

up to the stone jamb, and back to the external facing, and where a stone toothed well into the core they took the opportunity of temporarily supporting it by bricks set dry and wedged up. The hole made went right through to the back of the outer facing flints, and, what is very important, the flints and all surrounding work within the cavity was scraped and brushed clean of decayed mortar and dust. But when one saw it in this condition and saw all the temporary support given, obviously it was not dangerous. The excavation, although big enough for a man to work in, was after all small compared with the whole mass. The filling up of the cavity was carried out on the same scheme which applied to the whole building—viz., to level up the bottom of the cavity with concrete, and then to bed three courses of hard paving bricks on the concrete, skilfully bonding the outer face stones and the flint, as well as the stones of the door jambs, into the brickwork, leaving a toothing on the side opposite the door jamb to be picked up when an excavation on that side should come to be made. On this brickwork came a layer of concrete, followed by another layer of brickwork, eventually leaving the inside of the walls composed of bands of brickwork sandwiched in between beds of concrete. This is as clear a description as I can give you, but I must supplement it by saying that the work was done by an experienced hand, and many contrivances were used, such as arches spanning wide openings and corbellings to carry floor timbers, and in one case an arch laid horizontally to guard against special strain.

(To be continued.)

THE foundation stone of a new infirmary for males in connection with the Kingston-on-Thames Workhouse has been laid. The infirmary, with a nurse's home and other buildings, is to be erected at a cost of over £18,000.

THE Cardiff Corporation intends to erect, at a cost of £12,500, a fish and general huckster's market, on a site which it has acquired between The Hayes and the Glamorganshire Canal. The building will be constructed of brick, with stone dressings, and will consist of two storeys, independent of the basement. The building has been laid out by the borough engineer, Mr. W. Harpur.

BRECHIN CATHEDRAL.

A PROPOSAL has been made for the restoration of Brechin Cathedral, a venerable pile with an interesting history. The date of the Cathedral is generally given about 1156, the earliest portions standing belonging either to the latter part of the twelfth or the early part of the thirteenth century. Shortly after the introduction of Christianity by St. Columba, the Culdees founded one of their missionary centres at Brechin, and built a college in which to train preachers for the work of evangelising the people. Of the buildings erected by the Culdees during their time no trace now remains, with the single exception of the Round Tower, but all around they have left traces of their presence. Gradually the power of the Culdees fell away, and the Church of Scotland, which had hitherto been independent of Rome, came under the power of the Pope, to a great extent through the influence of Queen Margaret, the final transition taking place about 1124-1153, about which latter date Brechin Cathedral was first conceived. Commenced thus early, the church appears never to have been properly completed, but to have been added to at different times as the fancy or necessity of the Cathedral authorities dictated. Indeed, judging from the different styles of work, it appears to have had a somewhat chequered career, the greater part of the west gable and the south bays of the nave having been apparently rebuilt, as the result of some accident to the original building, about the middle of the fifteenth century. The church, which was dedicated to the Holy Trinity,

IN ITS ORIGINAL STATE

consisted of a choir without aisles, and a nave with five bays and side aisles, which were narrower than the present aisles, while its length would be about 84ft. A curious question raised by the proposed restoration is in regard to the transepts, which, it is believed, formed no part of the original plan of the church. That transepts—or, at any rate, a north transept—were attached to the building prior to 1806 is indisputable, as receipts granted by tradesmen for payments received on account of repairs done to the north transept are in existence, while old engravings also show the transepts. A feature in these engravings that points to the transepts being no part of the first plan, is the fact that their erection has closed the clerestory window in the east end of the nave, while the apparent narrowness of the openings that had connected them with the main body of the church seems to preclude the idea of their having been used by the worshippers in the ordinary services. So far as is known the Cathedral did not suffer any serious damage at the Reformation, the inhabitants having been rather cold in the matter, and not by any means fired with the iconoclastic spirit that animated their countrymen at that time; and the vandals of a later age must bear the shame. Tradition lays the blame on the soldiers of Cromwell, with what justification is doubtful. What is more probable is that the building suffered more through that spirit of indifference with which for a long time such relics were regarded, and that once the seeds of decay had set in, the work was helped forward, as it has been in too many cases, by using the stones of the decaying part for the erection of other buildings. The greatest damage was, however, done in 1806, when the church was reconstructed. To undo the damage then done is almost impossible. Nothing was too sacred to escape the destructive energy of those engaged in the work. Even

THE ROUND TOWER

itself had a narrow escape, a proposal having been made by the architect to demolish it and use the stones in the reconstruction, on the score of economy. Fortunately this design failed, a threat from a neighbouring laird, that he would "hang the first rascal from the top of the tower who dared to touch a stone," having due effect. But the spirit that animated this proposal may be seen in the church as it stands to-day. The aisle walls and transepts were demolished, only the walls being rebuilt,

and these were carried up, closing the clerestory windows in the nave, the nave and aisles being enclosed under one roof. Galleries were then introduced, running right round the church, the pillars and wall of the nave being cut and broken to admit the woodwork. A plastered ceiling, which hid the roof and closed up the traceried work of the great west window, was added, while the stonework of the nave was coated with the same material. Of the original building

THE ONLY PARTS NOW VISIBLE

are the arches of the chancel and the west doorway, the latter having apparently escaped from the accident that led to the reconstruction of the west gable. The chancel, or such of it as now stands, is an ivy-covered ruin, but sufficient remains to show its original grace and beauty, and form a guide for the restoration of the remainder. The carved work of the west doorway is in a somewhat dilapidated condition, but otherwise it has escaped. Indeed, the whole west end, with the exception of the south aisle, has been practically preserved in its first condition; the doorway, great window, and tower, the latter built about the middle of the fifteenth century, having to a considerable extent escaped. The bell or square tower is 70ft. in height, with an octagonal steeple 58ft. high, giving a total height of 128ft. Entrance to the tower is had by a short flight of steps on the north side, but this entrance appears to be of recent formation, and originally the only entrance was from the church. On the ground floor there is a vaulted chamber, now used as a Session House, and which was originally the Chapter House of the Cathedral. The ribs

supporting the roof spring from corner capitals, and in three of the corners there are carvings of foliage, while in the fourth there is a dog picking a bone. The other stories in the tower are used as a belfry, and for other purposes. In the interior of the church the walls of the nave are still mainly in their original condition, the stone being, as stated, coated with plaster, and the niches are distinctly visible from the interior. The work involved in carrying out the restoration is very considerable, and it is understood that a sum of at least £10,000 will be required.

LEAP CASTLE.

NEWS comes from Birr of the discovery of a series of interesting "finds" in the historic Leap Castle. The first and most important was an eleventh century stone spiral staircase springing from the first floor level and terminating at the summit of the great tower, 100ft. high. This relic of a remote past is in a splendid state of preservation. The finely-cut stone steps are laid with mathematical accuracy, and are large, like the passage itself. The second "find" is an entrance to the guard-room cut out of the rock, and which was up to the present believed to be a mass of solid masonry. The present owner has put into a complete state of preservation the ancient chapel, an apartment 25ft. square and high, which is on the top of the tower, and here has been discovered a very large and fine Early English eastern window, which, from its great elevation, commands a view embracing eight counties.

CENTRAL ENTRANCE, TATE LIBRARY, BRIXTON. SIDNEY R. J. SMITH, ARCHITECT.

IN LIGHTER VEIN.

THE A.A.'s "BROKEN CONTRACT."

ONCE a year, at any rate, it is the custom of the Architectural Association to forsake, in its gatherings, the council chamber for the theatre, to neglect the art of the architect in favour of the art of the playwright. And, be it said, this annual diversion is invariably attended with the most successful results—though we understand there is no truth in the statement that that very staid and sober body, the Royal Institute of British Architects, has, by the attractiveness of the social functions of the more frivolous A.A., been lured into like levity. There is, we suppose, a light side to Architecture, or rather to the practice of it. If we mistake not, the vagaries and idiosyncracies of certain persons connected with this most ancient and honourable Profession have from time to time been exposed before an amused public, and it is well that the members of the A.A., relaxing their professional austerity, should come once a year to witness "a comedy of Architecture." For in its amusements, the A.A. never deserts Architecture. "The Broken Contract" was the title of the play with which the members were this year entertained, and they assembled in large numbers at the conversazione held at the Matinée Theatre, Langham Place, on Friday night. Mr. F. D. Clapham is the author of the play, and whilst it is unreasonable to hope that he has produced anything which will be handed down for the amusement of posterity, it must go to Mr. Clapham's credit, and also to the credit of Mr. Leonard Butler, who supplied the music, that jointly they succeeded in unflinchingly entertaining the A.A. If we were to venture on further criticism, we should say that there is too much of a sameness about these A.A. plays. "The Broken Contract" as the sub-title informs us, deals with "an Egyptian enigma" in two acts. The action of the piece introduces us to a group of ancient Egyptians and a band of latter-day architectural tourists, who, by the many professional allusions with which the libretto abounds, cause great merriment, and whose

"... object is to prove the tale
Of Egypt's bygone history,
And see what customs did prevail
In this strange land of mystery."

We will not recount how they set to work on their task—a task which will probably never fall to the lot of the present-day student; but the piquancy of the professional allusions is never lost, as:

"You may perhaps have noticed what a lot of things are done

By cooking, yes, by cooking,
And it may be that a competition is very often won

By cooking, yes, by cooking.
On plan you'll find there's nothing underneath
A three-foot wall,
A column in the attic perhaps has no support
at all;

You can make your elevations, too, look either
low or tall

By cooking, yes, by cooking."

And the A.A. excursion, too, proves fruitful in the librettist's hands. Its pleasures are duly extolled:

"A jolly time we spend,
Our work and pleasure blend,
So now we recommend
To each and every friend
That they come on our excursion
for next year."

Clearly the play has been written by amateurs for amateurs, but as such it deserves all praise. The piece was very adequately produced, and among the performers, the efforts of Miss Mabel Engelhardt, Mr. Alfred Stalman, Mr. Frank Collins, and Mr. S. Constanduros were particularly noticeable.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 1st, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ACCORDING to Stow, St. Giles Church, Cripplegate, which was damaged by the recent big fire, was built a quarter of a century after the Conquest. It was nearly burnt down in 1545, and rebuilt immediately afterwards. On the other hand, it escaped the great fire of 1566. Milton lies buried in the present edifice; and amongst other noteworthy personages there lie interred here Foxe, the martyrologist, Sir Martin Frobisher, who was buried in 1595, and several members of the Lucy family, whose names are associated with the boyhood of Shakespeare. The registers and plate were promptly rescued. The former are interesting, and contain the record of the marriage of Oliver Cromwell and Elizabeth Bouchier, on August 22, 1620.

THE Italian authorities are so generally careful in sanctioning restoration of public monuments that we regret to have to report an instance where a most precious example of early Italian Art is at present receiving unsatisfactory treatment. This refers to the tabernacle or high altar of Or San Michele, at Florence. It will be remembered that it was originally ornamented with mosaics in precious stones. These, it is stated, were taken out by the French about a hundred years ago, and pieces of glass with the pattern painted and gilt on the inside, were set up in place of the old work. The French method is continued, only the drawing of the ornament being more careful. But the flashy, garish effect remains, the new colour being, perhaps, even more crude than the former. Some beautiful specimens of early Florentine mosaic ornament let into stone, as in the Or San Michele altar, are to be seen on the staircase of the Museo del Duomo, and surely if the restoration was to be made it might at least have been on the old lines, of which there is such a fine example at hand.

A PLEA is being made for the provision of cloak-rooms in churches. One correspondent describes churches as "storehouses by construction of the week's fog and damp, rarely efficiently ventilated or of proper temperature." "If a theatre were to be built with a like indifference to draughts and a like disregard for the comfort of the public, we should," the same correspondent remarks, "hear denunciation throughout the land."

THE London County Council intend to introduce into Parliament in the coming session five new bills. One of these proposes to amend the London Building Act of 1894 (fully described elsewhere). Another measure provides for the admission into the main drainage system of the Council of sewage from part of Acton (payment to be made for the same), and for the reception, treatment, and disposal of the sewage by the Council. By a third measure the Council seeks power to make a short new street in Westminster, to join a new street now in course of construction on part of the site of Millbank Prison; to widen parts of York Road, Wandsworth; to

widen a street called Albert Embankment, near Vauxhall Station on the east side, between Upper Kennington Lane and Vauxhall Walk; to take down the bridge over the Regent's Canal, known as the Rosemary Branch Bridge, and to effect various other improvements at Nelson Square, Charlotte Street, Blackfriars Road, Long Street, and Shoreditch. The other bills are to authorise the laying of tramways.

It will be remembered that the enlargement of Hampstead fire station was estimated by the London County Council's architect to cost £4170, but, upon the manager of the Works Department declining to undertake the work on this estimate, public tenders were invited, the lowest being £4955. The architect now says that his estimate was made at the beginning of May last, while the tenders were received on Oct. 26. Six months had therefore elapsed, during which time the labourers' wages and the prices of certain materials had increased, while there was an unwillingness to tender under existing conditions of contract. The estimate of the manager of the Works Department for the work is £4800, and a proposal will be made in due course to entrust the work to the manager.

THE Rev. Douglas Y. Blakiston, of Chichester, writes:—"The present seems an opportune time, now that attention is called to our cathedral, to notice a most interesting wall-painting in the chapel of the Bishop's Palace, which is close to the south-west tower of the cathedral. Many years since, Bishop Durnford was so kind as to show me this chapel to view beautiful tessellated pavement, placed at his own expense to form the floor of the sanctuary. I noticed a fresco of the Virgin and Child in the south wall of the chapel, which, though the colours were faded, was not materially injured, but which might suffer from damp, &c. When attending the funeral of the noble bishop I had another opportunity of inspecting this very interesting work, which certainly had suffered more injury from damp, large black blotches appearing in the diaper of the background, &c. My old edition of Murray's Handbook to Sussex, page 348, only says: 'The chapel is late E.E. with some additions. On the wall a curious fresco head of the Virgin has been uncovered.' The fresco is painted on a circular recess (about 3ft. across), and represents in pure but faded and simple colours, the Virgin with the infant Jesus on her knees; the details (Anglo-Saxon?) and form of the chair, with terminals resembling swans heads, are most curious. Through the courtesy of the Sussex Archaeological Society, I am enabled to give a reference: 'In a volume published in 1883 . . . and entitled "A list of buildings in Great Britain and Ireland having mural and other painted decoration, &c.," by C. E. Keyser, M.A., F.S.A., it says—Chichester, Sussex, The Bishop's Palace, Domestic Chapel of the Bishops, the Virgin and Child. Time of Henry III., i.e., A.D. 1216-1272. Personally, I hope this painting will not be much 'restored,' but it might be, at little expense, protected and preserved from the further injuries of age and damp."

SOME unusually interesting wall paintings have been discovered in the remains of a Roman villa at Boscoreale, on the flanks of Vesuvius. There are decorative designs of flowers, birds, and fishes, mythological fancies, landscapes, and sea pieces. But the freshness and realism of some of the subjects is remarkable. One represents a country house on a river, with a man angling from the bridge. The place was a villa and farmstead combined. On the granary walls are writings referring to storage of beans and oats. In the wine cellar are four large wine vases. Seven skeletons have been found, and the farm people appear to have fled for shelter to the villa when destruction came upon them.

THE work of demolition in connection with the frontage of Drapers' Hall, Throgmorton Street, is proceeding, but the alteration will in no way affect the handsome courtyard, or,

indeed, the internal arrangements of the hall. The fine marble staircase has been removed, and when the new work is completed the staircase will be situated in the centre of the building. It will then be in a much more suitable position, as it will give access to all portions of the hall. The architect is Mr. T. G. Jackson, R.A., from whose plans a handsome stone building will be erected facing Throgmorton Street. The building will be let as offices.

In the corridor of the School of Art at Ghent there has for many years stood a great half-length statue, or exaggerated bust, representing Napoleon as First Consul, draped in the folds of an ample cloak. This effigy attracted but little attention, and no one seemed to know how it came there or who was its sculptor. M. Masterlinck, the custodian of the school, bethought him the other day of examining more closely the despised marble, and came to the conclusion that it was a fine work by the eminent French sculptor, Rude. He had some photographs taken, which he

admiration. In an adjoining case are some splendid specimens of carved wood, comprising portions of the frieze of a room in carved fir wood; a charming panel; a cabinet of ebony and other woods, inlaid with ivory; and a box or coffer of walnut wood, carved all over in Gothic tracery. A third case contains some interesting examples of wrought-iron work, amongst which may be mentioned an old picket candlestick bracket of quaint design; ancient locks of complicated mechanism, and enriched with foliated open work; and an old-fashioned iron knocker. On the walls is a set of photographs of different articles of carved wood, the originals of which are in Berlin, at South Kensington, or in some other museum.

An object of special beauty in the collection is a mirror frame of ebony, inlaid with foliage and figures in engraved ivory, and with shell cameo medallions of small Roman heads and zodiacal signs. There are some beautiful specimens of linen work and old damask patterns and designs. Much attention will

of Edward I. (1293), Richard II. (1394), and James I. (1623).

SIR JOHN WOLFE BARRY, president of the Institution of Civil Engineers, specially visited last week the Trades Technical School, carried on by the Company of Carpenters and other City guilds connected with the building trade, in Great Titchfield Street, Oxford Street. The fifth session of the institution has now been started, and, though the school commenced in a small way, yet the great need of the method adopted of training the craftsman was amply shown by the fact that during the previous session 378 individual students had attended the various classes. Students who go to the school go to work, none but actual craftsmen are admitted, and no social entertainments or relaxations are permitted, as is the case in other training schools. To judge the work of the student and the way he does it is believed by the managers of the school to be the only sound and true test of the capability of a student, and this is the only examination that a student in this school has to undergo.

ELEVATION TO GREEN ST

NEW RESIDENCE FOR LORD RIBBLESDALE, NORFOLK STREET, W. SIDNEY R. J. SMITH, ARCHITECT.

sent to Dijon, the sculptor's native place, and the committee of the local museum recognised the bust at once as the creation of their fellow-citizen in his best period. The citizens of Ghent are overjoyed at this discovery, and the interesting relic has been promoted to a place of honour in the gallery.

THE annual change in the Art objects lent by the authorities of the South Kensington Museum for exhibition in the Art Gallery and Museum in connection with the Belfast Free Library, has recently taken place. Among the exhibits are exquisite specimens of Wedgwood and other ware of rare and beautiful designs. The cane-coloured and delicate lilac-tinted samples are sure to be specially admired, and the frame of turquoise-blue cameos, as well as the examples of Leeds ware, will also come in for a considerable amount of attention and

doubtless be attracted by the Mohammedan prayer carpet of white cotton, quilted with white silk in diaper of scale forms, and embroidered with coloured silks in chain stitch, with sprigs of carnation symmetrically ranged over the ground, and bordered on three sides. There are also four frames of original designs for wall tiles by Sir E. J. Poynter, P.R.A., and eight pictures, amongst which may be noted "The Lake of Constance," by A. Zimmerman; "View of Old London Bridge," painted in 1650, by Claude de Jongh; and "The Pool," by W. Mulready, R.A. The other objects include beautiful architectural models in stucco of portions of the Palace of the Alhambra, Granada, and a fine photograph of a guitar inlaid with tortoiseshell mother-of-pearl and ivory. Visitors to this room should not forget to examine the ancient paymaster's money-bags, used for conveying money for paying the wages of the soldiers in the reigns

IN June last the London County Council served a notice on the "owner" of the Church of St. Mary, Charing Cross Road, that the west and south walls must be repaired. The Rev. R. Gwynne, the vicar, claimed that he was not the owner, according to the meaning of the Acts, and took no action. Eventually an order was issued upon him, specifying the repairs required by the County Council, and directing that they should be carried out at once. As nothing came of this, the County Council has stepped in and pulled down so much of the edifice as was dangerous, and the body of the old church is now open to the elements. It was in 1677 that this church was built by one Joseph Georgeirenes, Archbishop of the Island of Samos, who had been driven from his See by the tyranny of the Turks. He has recorded this in an inscription over the west door. The church has been in various hands. The French Protestants occupied it next until the year

1822, when, their lease being nearly expired, they sold the remainder of the term for £200 to a congregation of Calvinist Pædo-Baptists, who continued there till 1849. In that year the old fane was in danger of being turned into a music hall, when the Rev. Nugent Wade, rector of St. Anne's, Soho, bought in for £1500, and after being arranged for the service of the Church of England, it was in 1850 consecrated by Bishop Bloomfield, under the title of St. Mary-the-Virgin, as a chapel-of-ease to the mother church. The foundation stone of the clergy house was laid by Mrs. Gladstone in 1869; that of the chancel by Canon Liddon on April 17th, 1872. Sir Roundell Palmer (Earl of Selborne) presented the stone Greek cross over the west door. It is estimated that the cost of carrying out the improvements necessary will entail an expenditure of £1000, and a public subscription is being raised to meet that amount.

MR. CHARLES JOHN SHOPPEE, Past President of the Surveyors' Institution, and Fellow of the Royal Institution of British Architects, has just died at his residence, 41, Mecklenburg Square, in his 73rd year. Mr. Shoppee represented the Surveyors' Institution as a delegate at two Congresses of Surveyors of different nationalities, held in Paris in 1879 and 1880. He was well known as an able architect and surveyor, and had very considerable experience as an arbitrator and umpire in references and compensation cases. He served for two years as President of the Surveyors' Institution, on the Tribunal of Appeal with regard to the Metropolitan Building Act. He was the architect for the restoration of the old Hall of the Barber Surgeons Company and for the development of their estate in Monkwell Street, and represented that Company upon the Committee for the Irish Estates; he also acted for the Bakers' Company in conjunction with the late Mr. Joseph Clarke. He was chairman and treasurer of the Chromo-Lithographic Art Studio, and was an authority upon heraldry, scarce books, and prints.

It is reported from Montreal that Mr. J. I. Tarte, the Canadian Minister for Public Works, has had a new plan of harbour improvements prepared in his department, and has forwarded it to the Montreal Harbour Commissioners. The new plan provides for the construction of two piers in the centre of the harbour, with wharves of 300ft. wide and 700ft. long, with the exception of the first one, which is 600ft. on one side, on account of its being nearer the entrance to the canal. There will be over 1000ft. between the canal and wharf. The long wharf will be extended to 250ft., so that railway tracks, switches, sheds, and other facilities may be provided.

In regard to the offer of Mr. D. P. Sellar, to present to the Corporation of London some 200 Old English, Italian, and Dutch pictures, to form a nucleus for an Art Gallery at Guildhall worthy of the City, the Lord Mayor has received a letter from his predecessor, Sir G. Faudel Phillips, stating that he accompanied Sir E. J. Poynter, P.R.A., and Mr. Temple, director of the Art Gallery, to view the collection. Taking into consideration the various quality of the works—though gratefully recognising the well-intentioned offer—they could not advise the Corporation to accept the whole or any portion of them. At a meeting of the Court of Common Council, Mr. Sellar's offer was considered and rejected. At the same time the thanks of the Court were ordered to be sent to Mr. Sellar.

THE English company which works the marble quarries on Mount Pentelious, which of old furnished material for the Parthenon, has offered blocks of large size and flawless quality to be used in restoring and strengthening that edifice. The work was interrupted by the war, but the Athens Archaeological Society has decided to resume it. The western end of the Parthenon has for some time been masked by a heavy wooden staging, and last summer some blocks of new marble were lying about,

whilst one or two were in position. Their intrusion is a pity, but it is justified under the present conditions.

DURING the last session of Parliament the London County Council obtained powers to construct under the river at Greenwich a tunnel for foot passengers. The sum which the Council is authorised by the Act to expend on the work is £70,000. When the matter was before Parliament certain compensation clauses were inserted, but the estimated cost was not altered to meet the varied circumstances. The Bridges Committee of the Council have now had an amended estimate of the cost submitted to them, and they are advised that it is necessary to provide for an increased sum of £30,000. The Committee accordingly communicated with the Finance Committee on the subject, and they have suggested that the carrying out of the scheme should be postponed until Parliament has sanctioned the further expenditure, as they have been advised by the Council's Parliamentary agent that it would be more expedient to defer the work until the judgment of Parliament has been obtained on the increased estimate, and that the commencement of the work in the present circumstances involves at least the theoretical risk that large expenditure may be made and heavy liabilities incurred, while the Council has no statutory power to raise the money estimated as required to carry the work to its completion. The Bridges Committee state that the case is different from one in which, after the commencement and partial execution of the work, unforeseen difficulties occur, increasing the cost above the original estimate, and they point out that the matter does not permit of delay, as the inhabitants of Greenwich and the surrounding localities have pressed for a speedy completion of the work. Moreover, they do not think that the Council will be compromised if they proceed with so much of the work as will involve an expenditure not exceeding the sum mentioned in the Act, and in the meantime Parliamentary sanction can be obtained for the further amount of £30,000. They have reason to believe that if the work were to be advertised at an early date, the cost would be less than if the carrying out of it were postponed until the latter part of next year. The further expenditure is, in their opinion, problematical, but it has to be provided in consequence of the action of Parliament in inserting the clauses for compensation to persons interested in the existing ferry rights and ferry.—At the meeting of the Council the recommendation of the Committee was approved.

A SPLENDID font has just been dispatched for the new Cathedral at St. John's, Newfoundland. It has been designed by Mr. J. Oldrid Scott, F.S.A., under whom Newfoundland Cathedral, which was unfortunately consumed by fire a few years ago, is being rebuilt by sections as means allow. The font is in the decorated style of Gothic Architecture, and has a central shaft surrounded by columns of polished Levanto (Greek) marble, a beautiful and rare material. The bowl is circular and of the same costly and exquisitely mottled marble—it is of exceptionally large proportions, girthing over 10ft.

SYMPATHETIC pilgrims to the old prison of Chillon, on the Lake of Geneva, have no doubt gazed with reverent eyes on the track worn in the stone pavement round the pillar to which he was chained, by the unhappy Bonivard, during his three years' incarceration. This year the famous footprints mysteriously disappeared and M. Vuillet, a deputy, inquired of the Government what had become of them. Thereupon M. Vecquerat, Councillor of State, rose, and unblushingly explained that they really had never existed at all, but were artificially manufactured to satisfy the demands of a sentimental public. This year the usual repairs were done so late that there was no time to renew these venerable shams. Tell has dwindled into a myth; Rousseau's grave is untenanted, and now Bonivard will become a by-word.

MR. J. WATTS, a member of the Lee Board of Works, writes: "A speculating builder acquired a piece of land in Charlton, in what was then a good residential neighbourhood. He applied to the L.C.C., and they granted him permission to build (shops) far beyond the evident line of frontage, without consulting the Local Board at all. The board protested, and the L.C.C. discovered what a mistake they had made, but were unable to revoke their decision once given. A great deal of law followed, probably £3000 worth, but the unnecessary shops, and an abortive public-house 50ft. high, stand as the most convincing evidence of the folly of governing Charlton from Spring Gardens. No local body would have permitted a builder to build beyond the frontage clear to everybody, and defined by the architect of the L.C.C. So, as a much-injured parishioner, I acclaim Lord Salisbury's announcement, that powers which have been so ill-exercised are to be taken away, at the same time admitting that you could not expect such a centralised body to do any better."

NORMANDY and Brittany, once so popular with our painters, have of late been somewhat neglected. Mr. H. S. Hopwood, in over sixty pictures now on view at the galleries of the Fine Art Society, demonstrates that there is plenty that is picturesque and a sufficiency of eminently paintable material still remaining in the quarters alluded to. The brightness of Normandy and the more sombre mellowness of Brittany find adequate rendering in this exhibition, and the difference between those two portions of France, both as regards scenery, people, and costume, is most clearly defined. The fine colour with which he has imbued some of these picturesque, sombre interiors, shows how closely he has studied his subjects, and how cleverly he has caught and reproduced their special characteristics. None will appreciate this collection more than those who are well acquainted with the highways and byways of Normandy and Brittany.

THE Dean and Chapter of St. Paul's have decided to celebrate the bi-centenary of the opening of the Metropolitan Cathedral tomorrow (Thursday), by the holding of a special Masonic service. The service is declared officially to be in acknowledgement of the tradition that Sir Christopher Wren was a freemason, Master of the Lodge of Antiquity, and that most of the workmen were also members of the fraternity. It is proposed that the offertory shall be for the purpose of enabling Freemasons as a body to take a distinct share in the completion of Wren's great work, by decorating a panel or bay with mosaics (with an inscription to record the fact) according to the scheme now being carried out under the direction of Sir W. B. Richmond, R.A., K.C.B.

SIR JOHN WOLFE BARRY, speaking as President of the Institution of Civil Engineers, at the dinner of electrical engineers, said they were all engaged in applying the great forces of Nature for the use and convenience of man. One could not help seeing that the value of abstract science in its various applications was much more recognised now than it was twenty-five years ago. This country would be far behind if it relied entirely on practical knowledge or what was understood by the homely expression of the "rule-o'-thumb." Everybody now understood that they must go to science for new developments.

THE Municipality of Barcelona has officially announced the opening of the Fourth General Exhibition of Fine Arts and Art Industries, which will take place on April 23rd next. The Mayor of Barcelona will invite the most notable and distinguished foreign artists on behalf of the Municipality, through the respective committees, to send some of their works to the Exhibition, and all costs of transport, going and returning, will be borne by the town. The works acquired by the Municipality will be destined for the Fine Arts and Art Industries Museums.

CITY FIRES.

A CRITICISM ON THE CRIPPLEGATE CATASTROPHE.

THE Cripplegate catastrophe has naturally prompted numerous appeals for measures of various descriptions for the prevention of fire. Before dealing with these appeals, a few facts concerning City fires of the past fifteen years, with special reference to the latest disaster, may be interesting—and, perhaps, more than interesting. Whenever the seat of a fire has been in the heart of a network of courts, alleys, and narrow thoroughfares, there the greatest risk of widespread extension has always existed. The London County Council has no control over the City architect's department, and cannot be held responsible for the class of buildings which are erected in such close juxtaposition as those in the immediate neighbourhood of the General Post Office, upon a system which experience has shown to be the reverse of fireproof. Wherever iron girders, huge plate-glass windows—which, upon breaking, admit a gush of air to fan the furnace—and slender party walls, with matchboard linings, form structures with highly inflammable contents, the work of fire extinction is always difficult. It is not easy even when the firemen have ready access on all sides, and great damage may be done, as in Charterhouse Square on Christmas Day, 1889, when a corner plot, occupied with buildings of six floors, and intersected with passages, was ravaged by the flames. It was recorded at the time, says the Daily Telegraph, that, twelve minutes after the alarm was received at Whitecross Street, within a quarter of a mile, the roof having already fallen in and the floors given way, the expansion of the iron girders and pillars inside the building thrust out the walls—which were not sufficiently strong to resist the pressure—and

TREMENDOUS MASSES OF MASONRY

were projected into the square. Captain Shaw himself directed operations at the Clerkenwell fire in 1885. Thirty steamers were engaged, with three hydrants and a standpipe, and the plan of combating the flames was not dissimilar to that adopted by Commander Wells on Friday week. Where the fire had obtained hold, between Charterhouse Buildings and Foresters' Place, it was allowed to burn itself out, the efforts of the men being directed to save adjoining properties, including the Foresters' Great Hall, in which they were successful after about three hours' hard work, though the danger was not at an end until nearly five hours after the first alarm. It is

THE NARROWNESS OF CITY STREETS

which is the next great danger, after inflammable buildings and stock, that is to be feared. Fires seldom are allowed to make any difference in the lie of streets, though Wood Street, after the 1882 visitation, was slightly widened. Buildings are, as a rule, erected on the old sites, so far as these can be ascertained, and, though they may differ in construction, the public thoroughfares and the rights of way through alley and court are all preserved. It is a pity, perhaps, that the opportunity of clearance by fire is not more frequently seized to effect great improvements. What, for example, could not the Goldsmiths' Company, as the chief freeholders, do in replanning Cripplegate upon more enlightened principles? Whenever there is difficulty of access the firemen must, as they did on Friday week, play round the furnace, in the hope of checking its progress. They were happily favoured by the fall of a house in Jewin Crescent, which enabled them to meet the foe on better terms. Had not that house given them a vantage point, the area of the outbreak might have extended much further toward Australian Avenue.

THE CONDITIONS AT CRIPPLEGATE

recalled those of the Paternoster Row outbreak, which was similarly hemmed in with buildings, and they were absolutely identical with those of two fires in the immediate neighbourhood, to which the brigade succeeded in putting an effectual stop. The earliest of these outbreaks

was on February 4, 1890, in a hidden building approached from Gresham Street, Aldermanbury, and Love Lane. Iron pillars, joists, and concrete floors helped to make the fabric sound, and limited, it was supposed, the extent of the disaster. In this case Captain Shaw availed himself of a building at hand as a convenient base for effective action with the hose, and a furnace of about 15,000 square feet was confined to these bounds until sparks unfortunately ignited other premises.

THE DUTY OF ARCHITECTS.

Mr. T. R. W. Mossman, of 16, Cheriton Square, S.W., makes some very pointed comments in the Times, which deserve careful attention. In a letter he says: "I venture to hope that the great destruction caused by this fire will be the means of impressing upon architects and others the necessity of reconsidering the manner of constructing buildings of a similar class as those which have been destroyed. I admit that architects (I am one myself) are not altogether responsible for the present state of affairs as regards construction; they are too often handicapped by the question of expense, and, so long as the regulations of the Building Act and the insurance offices are complied with, things will no doubt remain pretty much as they are. But many will agree with me that our warehouse architects might very well spare a little of the money which they use for plastering a lot of meaningless detail and ornamentation on the fronts of their buildings for the better construction of the building itself. As can be seen from an inspection of the devastated region, a great deal of the usual, and of course necessary, wrought and cast iron was used in framing the floors and walls together, and the fire has treated most of it with the greatest contempt, as it always does when it has time to give it proper attention. To the failure of the stanchions, columns, and girders to withstand the great heat must be attributed a great deal of the destruction and rapidity with which the fire spread. During the fire I witnessed several ornamented cast-iron stanchions, which supported

IRON GIRDERS OVER SHOP FRONTS,

gradually buckle or bend inwards to the heat and fall away, the walls overhead collapsing almost immediately. Girders, I noticed, which had their bearings on brick piers instead of stanchions resisted the fire wonderfully well. Although unprotected, these girders must have expanded laterally to their utmost limit, but so long as there was sufficient space at their ends to allow for such expansion the walls were not bulged out. Why architects do not more often encase their stanchions and girders in brickwork, terra-cotta, or other fire-resisting material I cannot make out. Fires are always with us, and always will be, and so long as it remains the custom to leave columns, &c., unprotected, destruction to a greater extent than is necessary will follow in its wake. In my humble opinion, a deep girder of iron is preferable to a shallower one which must be supported by a column. The column being isolated, the flames can "caress" it from top to bottom, and eventually destroy it, and if it is a ground-floor column, down comes the superstructure. The great objection urged against encasing columns or stanchions is that of occupying too much space, and space in the City is valuable, as we all know; but I venture to think that business firms would prefer to give up the small amount of space required for this purpose in order that, in the event of fire, their buildings might be reinstated in as short a time as possible. Insurance companies would lower their rates, as they attach great importance to the covering up of ironwork. As regards the

FLOORS AND CEILINGS OF WAREHOUSE

and such-like buildings, these, I think, should always be made as fire-resisting as possible. Very few of the buildings destroyed in this fire had such floors, and the tremendous rapidity with which the flames demolished one building after another can easily be accounted for by facts just stated and also by the narrowness of the streets, the close proximity of one

building to another in the rear, as well as to the large quantities of the most combustible materials stored in nearly all the buildings. In conclusion, I should like to say I was much struck by the way some of the terra-cotta work had withstood the flames; it seemed none the worse. Not so the stone façades, however; they presented a sorrowful appearance, hardly a stone but what has been split. As for cornices and pediments, they are no more. A few iron doors, constructed, doubtless, according to the Building Act, will, I fear, not be of much use to any one in future; they may have stemmed the flaming tide for a few minutes, but they had to cave in soon, as is evident from their appearance. I should prefer to put my trust in a well-made, solid oak door."

A CALL TO "MODERNISE."

"When the City of London was destroyed by fire, in 1666," writes T. H. W., "Sir Christopher Wren designed a new City which, had it been built as he planned it, would have made of London the finest, the most commodious, and the safest town in the world. Funds were wanting, and the rebuilding of London was left to private enterprise—with the result that we know. Last Friday week a fire cleared 17 acres of ground in the heart of London. We have all been lamenting the disaster; but if the Corporation is alive to its duties, the conflagration may prove a blessing in disguise. The region destroyed was a region of narrow, inconvenient, and dangerous streets, unworthy of a modern capital, and entirely unequal to the volume of business which had daily to be transacted there. I venture to suggest that the Corporation has now a plain duty before it, and an opportunity of doing a service to the citizens, of conferring a benefit upon the trade of the world, and of enhancing its own reputation, which may not occur again for half a century. Let it boldly take over the whole devastated area; let it pay no regard to the old streets and landmarks; let it plan these 17 acres upon modern scientific principles; and let it make of the Jewin Street region, a noble, safe, and convenient business quarter. If five millions are required for the purpose that sum can be raised in one day by a Corporation loan carrying 2½ per cent. interest."

PRACTICAL PROPOSALS FOR ARCHITECTS.

"What is Fire Protection?" This is the subject of a pamphlet issued by the newly-formed British Fire Prevention Committee. Mr. Edwin O. Sachs is the author, and in the course of his observations, remarks:—"I consider that stability, with due attention to sanitation and fire protection, should be the essence of modern building construction. Surely inferior construction not only shortens the life of a building, but it is also in every way detrimental to the interests of a *bona fide* investor. Safe construction enhances the value of a property, and the protective measures need not occasion much additional expense. Why not consider fire protection just as much a primary necessity for building as the block-signal system is for railway construction? Is there much difference in aiding a man's death by fire and his death in a railway accident? Why consider it more legitimate to spoil your neighbour's property by fire than to steal it? Bad construction means a risk to one's neighbour's life and property as well as to one's own."

I cannot here specially refer to the risks in theatres and assembly halls, which, to my mind, require separate legislation; I simply speak of factories, offices, business premises, hotels, and tenement houses. In no case should any inmate of a building be more than 60ft. away from a staircase, and preferably there should be two

STAIRCASES

at his disposal, in the event of one being blocked. Generally, attention is only given to the construction of staircases; but it must be pointed out that their ventilation is equally important. Smoke is even a greater danger than fire, and may hamper the helpers terribly. The possibility of opening a window has saved many a life. As far as the protection of pro-

erty is concerned, the prevention of outbreaks can be influenced by the careful construction of flues, hearths, stoves, and in certain classes of buildings by the construction of floors and ceilings, the arrangement of sky-lights, shutters, and lightning conductors. Then comes the prevention of the fire spreading, first, by the division of risks; secondly, by the

MATERIALS USED IN CONSTRUCTION.

When I speak of the division of risks, the legislator's first ambition must be to prevent a fire in one house spreading to another, and a stranger's property, so to say, being endangered. This is quite possible, given good party walls carried well over the roof to a height regulated by the nature of the risk, the arrangement of shutters to windows where necessary, or the use of fire-resisting glass; again, a thoroughly good roof—or, still better, a fire-resisting attic floor—can do much.

Take a drawing-room in an ordinary well-built house. If the joists are strong and the boards grooved, if some light plugging be used and the plastering properly done, if the doors are made well-fitting and fairly strong, a very considerable amount of furniture and fittings can remain well alight for half-an-hour before there is a spread. In a warehouse or factory 'risk' the same holds good. With well-built wooden floors, thickly plugged, and the ceilings perhaps run on wire netting instead of on laths, with ordinary double-ledged doors safely hung, at the most, perhaps, lined with sheet-iron on asbestos cloth, a very stiff blaze can be imprisoned for an hour. The general mistake of using

EXPENSIVE IRON AND CONCRETE CONSTRUCTION

is its aptitude to allow some breach being made through which the fire spreads. The iron door bends, and so does girder work. Then, again, directly a fire has obtained a hold, the composite floors are much too dangerous for the firemen to work on or under. The men cannot get near enough to the actual seat of the fire. Further, there is the extra danger of a stream of water touching hot iron, or the falling of a weight causing a general collapse, and, after the fire has been extinguished, the ironwork is generally so damaged that it requires entire renewal, and the brickwork is probably so strained and bulged that the re-erection has to be commenced from the footings. The simpler forms of construction are generally the more satisfactory, and I should mostly advise it as an architect. The few iron and concrete floors, for instance, which will stand severe strains, are, to my mind, too expensive to allow their introduction for fire protection alone, and, when I speak of their cost, it must be remembered that it is not only the expense of the floors which has to be considered, but also the extra outlay for stronger supports and foundations. By-the-bye, when speaking of the separation of minor 'risks,' the

DANGEROUS LIFT WELLS, SKYLIGHTS, AND SHAFT OPENINGS

should not be forgotten. The latter should be as small as possible, well armed with shutters, the skylights should again have fire-resisting glass, and the lift not only vertical doors, but also horizontal flaps, which would cut up the well into sections. Divisions of 'risks,' common sense construction, and proper staircase accommodation, are really all that fire protection requires, and, where the special Building Act clauses have been kept within the lines I have indicated, there has been little friction and discontent. It is only when, to quote an instance which I have known, a tenement is required to have a large passageway, through which a fire-engine could gallop into a courtyard, that the property owner very rightly considers himself

HARASSED BY PROTECTIVE MEASURES.

As to the fire survey regulations, they should mainly prevent the actual outbreak of fire. In certain classes of risks fire survey can also increase the personal safety of the inmates, and the possibility of a fire spreading may be lessened. The provision of fire-escapes or ladders, and a regular inspection of their efficiency, will do much.

Professional Items.

ABERDEEN.—Steps are now in progress for the restoration of St. Mary's Chapel, under the East Parish Church—remarkable as one of the two pre-Reformation ecclesiastical buildings in Aberdeen, Greyfriars Parish Church being the other. Portions of the plaster on the walls have been broken away, revealing the remarkably interesting carved corbels from which the stone ribs of the groined ceiling rise. At a meeting of the Ecclesiological Society the Rev. Dr. Cooper drew attention to the commencement that had been made with the work. He mentioned that the several committees charged with the restoration would be called together at an early date, that plans of the proposed restoration, now that the features of the old work were coming into view, were being prepared, and would be submitted without delay to the Town Council for its approval. He thought the work of restoration would probably be in full swing by the New Year.

BLYTH.—The large new graving dock—one of the largest in the kingdom—which has been constructed on the premises of the Blyth Dry Dock Company, Limited, was opened the other day. The dock itself, according to the description officially supplied, is 480ft. in length, width at cope 89ft., width at entrance 61ft., depth of water on sill at high water 22½ft., and the depth from cope to floor 31ft. 3in. A large conduit to convey the sewage and water, 730ft. long and 5½ft. diameter, partly constructed of brick and concrete and partly of steel tubes, had first to be made along the south side of the new dock, the dock wall being afterwards built round it. An extensive coffer-dam had to be constructed to keep back the river water during the excavations and concreting inside. The dock walls and floors are composed entirely of Portland cement concrete. The engine-room is below the surface level, and is 42ft. long by 33ft. 6in. wide by 23ft. deep, and is situated between the old and the new docks; the walls and floors are also built of cement concrete. The pumping machinery has been supplied by Messrs. Gwynne and Co., engineers, London. There is also one 10in. centrifugal pump for drainage, supplied by Messrs. Tangyes, Limited, Birmingham. The gates are built entirely of steel with greenheart mitre-posts, quoins and sill pieces are hung from the sides, and are held by strong anchor bolts built into the entrance walls. The gates have been built by the Brandon Bridge Building Co., Motherwell. The engineers for the work were Messrs. J. W. Sandeman and Moncrieff, Newcastle, the resident engineer being Mr. Donald Macdonald. The contractor was Mr. D. N. Brims, Newcastle.

BRIGHTON.—A school-chapel, representing a small portion of the original plans of a new Baptist chapel erected by Mr. G. Baines, was opened a short time ago. Recently a further and most important step in advance was taken, in the laying of the memorial stones of the church itself. The church will consist of nave, aisles, and transept, and its interior of flint with terra-cotta dressing will have a very striking appearance. The length of the church will be 80ft., and its width 49ft. in the nave and 53ft. in the transept. The interior also will be very handsome, the clerestory being supported by a series of Gothic pillars of polished marble, while the lofty windows will be filled in with cathedral glass, and all the woodwork will be of the finest pitch pine. The cost of the site and of the school-chapel was about £2000, and work to the amount of over £4000 remains to be done, making a total of £6000, towards which £3000 has been promised or paid.

CARDIFF.—Under the will of the late Colonel Page, a stained glass east window has been placed in Canton Church, Cardiff. The order was given to Mr. Edward Frampton, A.R.A. The subject of the window, which consists of five lights, is the Ascension of our Lord, and

the style and manner are those of the fifteenth century, with perpendicular canopies, and bases in silvery white glass, with ruby backgrounds. In the five lights are shown the disciples of our Lord, gazing upward in various attitudes of astonishment and awe at the ascending Christ. In the centre light St. Peter and St. John are kneeling, and two angels are appearing to the disciples, with the saying on a scroll, "Ye men of Galilee," &c. The background of the lights is a varied blue, richly diapered, and the Apostles are represented in low tone blues, diversified with much white, which is diapered with golden patterns and borders. There is a large amount of foliage, shown in beautiful, varied tints of green, which breaks up the background. The figure of our Lord in the large central piece of tracery is very stately. There are angels bearing the crown and palm of glory, and the sacred monograms, I.H.S. and A.O. (Alpha and Omega), are worked in. Altogether, the window is beautifully designed and constructed.

The architect's report upon the cost of renovating the infants' block at the Workhouse states that the building was in very bad repair, and needed renovating from top to bottom. The least sum which could in justice be spent was £1419. The Building Committee have decided that it would be better to build an entirely new building, and further decided that the new buildings should be erected at Ely.

DUBLIN.—The interior of the Cathedral, Marlborough Street, is undergoing a process of restoration and improvement. The stately Doric columns have been carefully repainted, and a beautiful new altar is to be unveiled. Six new windows—three on each aisle—have been substituted in place of the previously existing unsightly ones. The new windows have been designed after a fashion eminently suited for the purpose and place which they fill. They are in white tinted glass, with ruby key-border, in strict harmony with the architectural character of the church. As a medium for ventilation they are perfect in construction, and by the simplest method air can be admitted or excluded as may be desired. The glass and wood work has been supplied by Messrs. William Martin and Son, Stephen's Green, the iron frames by Mr. Loughlin Brothers, Brunswick Street, whilst the design is from the hands of Mr. Ashlin.

DULWICH.—The Lord Chancellor has opened in Woodward's Road, Dulwich, a new free library, given to the parish of Camberwell by Mr. Passmore Edwards. The building, though not excessively ornamental without, is light, airy, spacious, and cheerful within. It has cost £5800, of which Mr. Passmore Edwards pays £5000 and the vestry the rest. The site is a gift from the Governors of Dulwich College. Camberwell, with a population of 275,000, has now a central free library and four branches.

DUNDALK.—A new High Altar has just been erected in the Dominican Chapel, St. Malachy's, at a cost of £1300. The altar is a magnificent specimen of ecclesiastical art. The general material is white Sicilian marble. The portion under the altar table is divided into three panels, filled with groups of mosaic representing the sacrifices of Abel, Melchisedech, and Abraham, separated by octagonal shafts of Sienna marble on richly moulded bases, and having foliated capitals supporting a moulded cornice and table of 10ft. in length. The Super Altar consists of candle benches with red foreign marble risers, over which are panels of mosaic with floral ornaments. The tabernacle door is of richly embossed brass work, with clusters of columns of Sienna marble supporting a very ornamentally carved and mounted arch. The rearedos consists of a range of arched canopies over groups of the "Coronation" and "Ascension" in mosaic. The centre of the altar over the tabernacle is occupied by the remonstrance throne, which is composed of Sicilian and onyx marbles. At each side rise panels of sculptured angels in adoration, over which is a groined and gabled canopy of octagonal shape, surmounted by a

spire which rises to a height of about 27ft. The marble work has been executed by Mr. George Smyth, sculptor, Dublin, from the designs and plans of Mr. G. C. Ashlin, R.H.A., Dublin.

HOLYHEAD.—At St. Cybi's Church, Holyhead, the dedication of a south chancel aisle built in memory of the Hon. William Owen Stanley and Mrs. Stanley of Penrhos, took place within the past few days. The church is of great antiquity, and occupies the site of a monastery which was founded by St. Cybi in the fourth century. It was erected in 650 A.D., the body of the church being rebuilt in the time of Henry VII. The east window of the church belongs to the time of Edward II. or Edward III. The church has been restored in recent years, and the restoration committee retained all the architectural features of the time of Henry III. Sir Gilbert Scott estimated the cost of the restoration at £5000, and the late Hon. William Owen Stanley contributed £3000. Subsequently it was found that the oak would have to be entirely renewed, and Mr. Stanley contributed another £1000 towards this improvement.

IBROX.—A large addition has been made to the Ibrox United Presbyterian Church. Accommodation is provided for about 250 additional sittings by adding transepts to the east and west sides of the church and a large chancel to the north, in which are placed the choir seats, and a double manual organ, wrought by hydraulic power. The transepts are divided from the nave of the church by Early English Gothic arches, elaborately moulded, and three light windows filled in with flamboyant tracery and glazed with cathedral-tinted glass of antique design. The roofs are treated with hammer beam couples, and the spandrels and apex filled in with carved tracery of ornate design. The chancel is divided from the nave by a richly-moulded arch springing from clustered columns, having moulded bases and capitals, resting on carved and moulded brackets. A handsome octagonal pulpit of wainscot oak has been placed on the east side of the chancel, having carved panels and string course and buttresses, resting on a corbelled pedestal, with fret rail of wainscot oak. In front of the organ are choir seats, having ornate carved and moulded haffits, with pillars and bases, richly moulded in wainscot oak. There has also been added a new communion table and chair, and a baptismal font, all in wainscot oak. The whole work has been carried out from plans prepared by Messrs. Bruce and Hay, architects, 261, West George Street, and the contractors for the various works were:—Mason work, Mr. Robert Murdoch; wright work, Messrs. Allen and Baxter; plumber work, Mr. C. Johnstone; slater work, Messrs. Hamilton and Co.; plaster work, Messrs. Alex. Calder and Son; heating, Messrs. James Cormack and Sons; painter work, Messrs. Charles Carlton and Son; and Mr. John B. Kerr, clerk of works.

LANGHOLM.—The Dumfries and Galloway Antiquarian Society has concluded a week's excavations at Raeburnfoot, in the high-lying pastoral district of Eskdalemuir, about fourteen miles from Langholm, and has thoroughly confirmed a report that there was a Roman camp there. The Society dug down about 4ft., and discovered various small articles, and also a well-defined road. Mr. Barbour, architect, Dumfries, superintended the work.

LIVERPOOL.—Recently some interesting discoveries connected with the past history of Liverpool have been made during the excavations which have been going on in the lower parts of the city. The latest have been made in Tithebarn Street, owing to the laying of the underground telephone wires, where some hollowed-out trunks of trees, supposed to be water-pipes, have been unearthed. The "pipes" are said to have been laid about 100 years ago, and are trimmed at the ends to fit into each other socket fashion, and although they have been so long underground, they are in a wonderful state of preservation.

LOWER BEBINGTON.—Some time ago the Lower Bebington District Council invited designs for a proposed new sewerage scheme, involving the diversion of the various outfalls now draining into the Bromborough Pool, offering premiums of £50, £35, and £20 for the three best schemes. The award of the assessor (Mr. H. P. Boulnois, M.Inst.C.E.) has been made, and the premiums have been awarded in the following order:—(1) Messrs. Beloe and Priest, Liverpool; (2) Mr. H. Bertram Nichols, Birmingham; and (3) Messrs. Goodison, Atkinson, and Ford, Liverpool.

OXFORD.—The court of the Drapers' Company has approved the plans of a new building at Oxford, which will be the future home of the Ratcliffe Library, if the authorities at Oxford accept them. The cost of the new structure will be £18,500. The Ratcliffe Library was founded by Dr. Ratcliffe considerably over a century ago, but the space it now occupies will be absorbed by the extension of the medical school. The Drapers' Company, in the interests of education, has undertaken to erect the new building, the plans of which have been prepared for the company by Mr. T. G. Jackson, R.A.

RIPON.—The foundation-stone has been laid of the new Infirmary which is in course of erection at the Ripon Union Workhouse. The new building is estimated to cost £2650. It has a very admirable position on the east side of the existing buildings, with a good view in the direction of Ripon railway station and the valley of the Ure. The various arrangements have been designed on the most approved scientific principles, and the plans well drawn by Mr. F. H. Hargrave, architect, of Ripon. Including provision for nurses in the centre of the building, there will be accommodation on the ground and second floors for about forty persons. In addition to the sick wards for men and women there are day and duty rooms, foal wards, lying-in ward, with separate bath-rooms and lavatories in each section. There will also be hot water apparatus for heating the building. Local bricks are used in the construction of the building, with pressed bricks for strings, and Killinghall and Pateley stone for quoins, sills, &c. The contractors are Messrs. A. Trees, stone brickwork, &c.; H. Boddy, joiners' work; W. E. Dixon, plumbing and smith's work; J. Lowley, painting.

RUMBURGH.—The quaint old monastic church of Rumburgh has just been restored. A few months ago the appearance it presented was by no means that of an ecclesiastical building; except for the gravestones around it no one could scarcely tell that it was a church. But now it is very different: walls uplifted to their original height, windows refilled with good tracery, a lead roof, wood block floor, and solid carved oak seats, have transformed it into a very handsome building.

ST. ANNE'S-ON-THE-SEA.—A new convalescent home has been recently erected at St. Anne's-on-the-Sea. The new home, which has been constructed from plans prepared by Mr. Alfred Steinthal, architect, is situated about a mile from St. Anne's railway station on the high road to Blackpool. It is amply provided with ground for future extensions, and possesses an uninterrupted view of the sea, although standing some sixty or eighty yards from the coast line. The home has accommodation for twenty-five patients, as well as for matron, two nurses, and two domestic servants.

SANDAL.—A neat and appropriate monument will shortly be erected at Sandal to indicate the spot where it is said Richard, Duke of York, fell at the Battle of Wakefield in connection with the Wars of the Roses. It is about 15ft. high, of carved Bolton Wood stone, executed from designs of Mr. Hawksley, of London, by Mr. Thresh, of St. John's, Wakefield, at a cost of about £130. The monument represents the Duke clad in armour leaning on a sheathed sword.

SHEFFIELD.—The memorial stone of the new buildings in Gleadless Road, for the Ecclesall

Industrial and Provident Society Limited, has been laid. The buildings, which are estimated to cost £3600, are being erected from the plans of Messrs. Hall and Fenton, architects. They comprise a large basement, lined with white bricks, 7ft. by 4ft., special cellars for storage purposes, and the usual separate departments for the numerous businesses of the Society. A manager's house is to be provided, and the building will be fitted with a hydraulic lift. Mr. J. Lenthal, of Attercliffe, is the contractor, and the ironwork is supplied by Mr. Charles Ross.

SOUTH SCARLE.—The church at South Scarle is in a deplorable condition, and it is proposed to make safe and repair the falling tower, replace the lost north aisle, reseal the church (preserving the old oak benches), restore the old rood screen, if possible, and repair the roof. The estimate of the architect, Mr. J. N. Cowper, was £950. The contract for the work has been let to Messrs. Sherwin, of Boston, but they will not commence until the spring.

SWANSEA.—The foundation stone of the Victoria Home for Nurses, which is being added to the Swansea Hospital, has just been laid. The new building is being built at the rear of an administrative block, and will be connected with same by a corridor. In the basement it is proposed to provide the heating apparatus. On the ground floor, accommodation is provided for eight nurses, with a sitting-room adjoining, and with the usual lavatories and bath-rooms. On the first floor, accommodation is provided for ten nurses, with the usual sanitary arrangements. This new building will in every way be in character with the general style of the Hospital. Overlooking the lawn will be a verandah, and a small tower at the corner of the building. Everything throughout the building will be of the latest improvements, special care being taken with every detail. The plans for this work have been prepared by Messrs. Wilson and Moxham, architects, who are now also carrying out the new operating theatre at the Hospital. Mr. Thomas Davies, of Francis Yard, St. Helen's Avenue, is the contractor.

TARLETON.—A new school has been erected at Tarleton. It is built of stone, and in its architectural features harmonises with the neighbouring beautiful church in the decorated Gothic style. Both structures are the designs of Mr. C. A. Basset Smith, architect, of London. The school, which is destined to accommodate over 230 scholars, is built in accordance with the latest educational requirements, and is provided with two playgrounds. The largest room is floored with wood blocks, and is furnished with a sliding screen, by the use of which one portion of the room can be partitioned off.

TUNBRIDGE WELLS.—The memorial to the late Canon Hoare, in St. John's Road, has been formally dedicated. It is erected at the junction of the St. John's and Culverton Park Roads. The structure is purely Gothic in design, and not unlike the spire of a church at the top. It rests on a granite plinth of dark pennant stone, and on the front of the memorial is inlaid a medallion representation of the well-remembered face of the late vicar of Holy Trinity. Below is a marble tablet with carved border, with parapet and band of tracery. The four angles of the monument carry figures of the evangelists on pedestals. The total height of the pretty design, which cost nearly £1000, is 40ft., and Mr. Oldrid Scott, F.S.A. (son of the late Gilbert Scott), was the architect. The erection has been the work of local builders, Messrs. Strange and Son.

WALLSEND.—There has been unveiled, in Wallsend Parish Church, a beautiful stained glass window, consisting of three lights, in each of which a saint is depicted. In the first the saint is St. Aidan, who is represented with a stag at his feet; the centre light is St. Bede, with the Gospel of St. John in his hand; and the third light shows St. Cuthbert, with a crowned head in his hand. The window has been designed by Messrs. James Bacon and Co.

THE WINTER SESSION.

"INLAY."

At a meeting of the Edinburgh Architectural Society, held within the past few days—the president, Mr. J. A. Williamson, in the chair—Mr. J. F. Matthew delivered a paper on "Inlay," which gave a historical sketch of the typical methods adopted in the different countries, Persian, Indian, Italian, Spanish, Dutch, French, etc. He described the origin, progress, and decadence of marquetry, as also the methods of executing the work. The lecture was illustrated by a large collection of woods, examples of inlay and veneering, photographs, and drawings.

EGYPTIAN ANTIQUITIES.

The second meeting of the session of the British Archaeological Association was held at the rooms in Sackville Street, Piccadilly, Mr. C. H. Compton in the chair. Mr. Earle Way brought for exhibition some antiquities from Egypt, consisting of two bronze figures representing Osiris and Isis and Horns, of about 700 B.C., also a specimen of mummy cloth from a mummy recently unrolled, and two ancient bronze sheep-bells. Mr. Way also submitted some Roman coins of Carausius, Constantius, and Constantine (found lately in excavating for a main sewer in Union Road, Southwark), and a shilling of Charles I. The paper of the evening was by Mr. Thos. Blashill, entitled "Some Illustrations of Domestic Spinning." Mr. Blashill said that spinning, except in its modern revival, was a lost art. Implements used in spinning were seen in the most ancient Egyptian sculptures, and spindles with the whorl attached were found in Egyptian excavations.

A SCHOOL OF ART.

At a meeting of the Glasgow Architectural Association—the president, Mr. Wm. T. Conner, in the chair—Mr. F. H. Newberry, head master, Glasgow School of Art, delivered a lecture entitled "A School of Art." The object of a School of Art, he said, should be to teach craftsmen how to work in any material, and to engender community of thought and criticism between the different branches of study; but everyone must have an elementary knowledge of craftsmanship. As affecting architects, he considered construction and design should be relegated to the office, and the Art part only studied in school. On the important subject of lighting, the lecturer said that on account of its steadiness the N. light was preferable for beginners, but S. light also was often required as bringing out a variety of colour. Regarding windows, he laid down the axiom "one room one window," and that in one plain, i.e., no combination of window and skylight, as thus avoiding cross or reflected lights. Mr. Newberry then took up the different rooms in detail, and specifically their particular requirements.—At the close, on the motion of Mr. P. S. Hill, a hearty vote of thanks was passed.

PETERBOROUGH AGAIN!

At the London Institution, a few days ago, Mr. Arnold Mitchell lectured on "Peterborough Cathedral." He contended that it had been absolutely necessary to restore the exquisite west front. The two piers, supporting a wall from 4ft. to 5ft. thick, were leaning forward—one being 2ft. 5½ in. out of the perpendicular. This west front had been added to the original building, and Mr. Irving had discovered that it had replaced a structure of which the two existing piers formed part. When the present front was constructed those piers were strengthened in their substance, but not in their foundation. Hence the serious "fall." The wall above had "stretched," i.e., openings had occurred between the stones. Through these openings, as the necessary "pointing" was omitted, wind, rain, and frost had found their way, reducing much of the inner masonry to rotteness and dust. No doubt the little central porch was the mediæval way of arresting the tendency of the front to fall forward. Two years ago a great gale came, and several

pinnacles were blown down. Then the Dean and Chapter sought expert opinion, which showed that the two side gables must be taken down and rebuilt. A great outcry was raised, but the course recommended had to be followed. If the outcry had not been raised, and if sufficient public support had been forthcoming, a much more drastic alteration would have been undertaken, and some thought that more drastic alteration should have been undertaken. The three gables and the tops of the arches would have been removed, and then, after slices had been taken from the backs of the piers, they would have been restored to the perpendicular by means of screw-jacks. If that were done we could hand on the front of Peterborough Cathedral for 700 years to come. Whether the present restoration would be final, he could not say. The disintegrated condition of the inner masonry (evidence of which had more particularly been forthcoming since the present works were in hand) rendered impossible the project, suggested by opponents, of replacing the inside masonry without disturbing the "skin." One gable had already been taken down and rebuilt. The 2006 stones were numbered, and 1836 of them were put back in exactly the same places that they occupied before. Only 170 had to be discarded, new ones being substituted.

Views and Reviews.

HOUSE DRAINAGE.

Of good books upon the subject of domestic sanitation there can scarcely be too many. The subject is one upon which our knowledge is extending, and it is necessary that the very latest information should be periodically put into book form, and laid before the public. For this reason we welcome the appearance of a new book by Mr. Spinks, which, while written in so easy a manner that anyone could understand it, is full of valuable information. Perhaps the most important chapters are those on portions of the subject which are but little dealt with in other works on house drainage, particularly the one upon "Setting Out and Construction," giving the proper method of keeping the level book and records of the laying of pipe drains, and another upon the disposal of sewage from isolated houses, in which all the most recent systems are described concisely and yet clearly. At the same time it seems strange that Fig. 13 should have found a place in the book at all. Elsewhere throughout the book the necessity of laying drain pipes in straight lines is consistently insisted upon, but this diagram shows all the branch drains laid to curves and tortuous windings such as no modern sanitary inspector who knew his duties would be likely to pass. A few more detailed directions as to the method of testing drains would be valuable, and the arrangement shown for the school in Fig. 18 is by no means universally approved. It is a little difficult to understand whether the author advocates a separate system of main drainage for surface water, but if so, he can scarcely have had experience of the effect in practical work, as removing uselessly that storm water which is so valuable for flushing purposes. We should have thought that the bend shown in Fig. 61 would have been liable to choke at the corners, but do not know that it has been put to practical test. The joint between lead and stoneware is at any rate wrongly shown, and for this there is little excuse now that the brass sleeve is universally adopted. The trap, too, at foot of soil pipe, and open grid directly over, is an exploded fad. Needless to say, we should not take so much trouble to point out the detailed defects of an indifferent work. The book is a good one, and we hope that it will serve its purpose and help forward the improvement which is now going on in house drainage.

"House Drainage Manual." By Wm. Spinks. A Guide to the Design and Construction of Systems of Drainage and Sewage Disposal from Houses. (Biggs and Co., Salisbury Court, Fleet Street, E.C. November, 1897.)

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

COTTAGE BUILDING.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you tell me if I can procure any publications containing drawings of cottages or lodges costing from £200 to £300; or if any have appeared in your paper? Perhaps you can refer me to the numbers.—Yours faithfully,

H. W. F.

A series of articles on the planning of small houses, by Mr. H. V. Lanchester, has recently been completed in the BUILDERS' JOURNAL. They contain much useful information, and no doubt you would find them helpful in cottage building. "A Terrace House" was dealt with in No. 105; "Terrace Houses" in No. 106; "Pair of Cottages" and "Semi-Detached Houses" in Nos. 109, 115, 119, and 124. In addition designs of cottages have occasionally appeared in the pages of The Architectural Review.

THE GROWTH OF TREES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should like to know whether you could explain to me, through your Enquiry Column, the manner in which a tree grows. The points I want cleared up are: (1) How are the cells in the new wood formed? (2) How does the sap travel?—up in the spring and down the tree in the autumn, or always up the tree? (3) How does a tree add to its height, and also to the length of the branches? By inserting an answer to this enquiry, you will greatly help others besides myself, who at present are undecided on these questions, as the text-books on the subject do not agree. Thanking you in anticipation, I am, yours truly,

November 25th, 1897.

LIGNUM.

A full answer to your queries would occupy a whole number of the Journal. The questions are still in the debatable stage, which accounts for the differences you mention in the text-books. We will, however, give a brief outline of the processes as generally accepted by the later physiologists. The cellular tissue of the wood in exogenous trees is formed and increased by the multiplication of cells around the pith, itself a mass of large thin walled cells. This multiplication is effected by internal sub-division of each cell into others precisely similar by the action of the protoplasm contained in the cell, which is fed by accretion from the sap and leaves. The cells increase vertically as well as laterally, and by this means the stem and branches are increased in length, simultaneously with the increase of diameter. Strictly speaking, that which is popularly known as sap always moves in an upward direction, from the roots towards the leaves; it is then a thin watery fluid charged with mineral salts, to be changed, when it reaches the surfaces of the leaves, by the action of air, sunlight, &c., to starchy and saccharine matter, for the food of the protoplasm, that mysterious entity that comprises the life of the tree; this travels downwards during the "fall" or autumn, by way of the exterior cambium layer, and the more solid portions pass to the interior through the horizontal strata of cells called the medullary rays. During the winter an apparent rest takes place in the formation of cells, and the movement of sap; but whether this is entire or

only comparative, is not known with certainty. Further information upon these matters should be sought in some standard work on botany, such as Professor Asa Gray's (Macmillan and Company).

CUBIC AIR SPACE FOR COWS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The Local Government Board have approved of certain model regulations as to air space in cowhouses, 800 cubic feet being allotted to each cow. In measuring the cubic contents of a cowhouse, how should the roof space be treated? Should the whole space inside from eaves to ridge be measured (i.e., width at eaves by half height from eaves to ridge to get area), or should only the air space to a height of, say, 12ft. above floor be measured? Twelve feet is usually considered a maximum of useful height in living rooms. The question is, which method would an inspector under the Dairies and Cowsheds Order use? The point is important, as it is quite possible that a cowhouse measured by the second method would be condemned as not containing sufficient air space, but if measured by the first method it would do so. For example, a cowhouse with which I am acquainted measures 40ft. long, 17ft. wide, 9ft. high to eaves, roof one-third span, say 6ft. rise for ten cows. If all air space to ridge is measured, each cow has 816 cubic feet, but if air space is measured to 3ft. above eaves (i.e., 12ft. from floor) each cow has 754 cubic feet.—Yours faithfully, W. J.

In the absence of special mention to the contrary in the regulations, the whole air space would be measured, unless this involved an absurdity, as in the case of very low eaves and a high-pitched roof, when an inspector would, doubtless, be justified in using his own discretion.

TECHNICAL WORKS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly inform me, through the medium of your Enquiry Department, of the best books (not going too much into detail) to gain a rudimentary knowledge from of: (1) The arrangement for and carrying out of small water supply schemes; (2) The arrangement for and carrying out of small gas works; (3) The arrangement for and carrying out of small sewage disposal works? From what source can information be obtained as to the planning and fitting up of slaughter-houses, and the lairage, &c., that is required in conjunction?—Yours faithfully,

"WAITING."

We do not know of any books devoted to small designs in the engineering schemes mentioned, but suggest that you consult some standard works on the respective subjects. Below are given the names of a few books which will answer your purpose: 1. "Water Engineering," by Chas. Slagg, C.E.; Crosby, Lockwood, and Son; 7s. 6d. 2. "Construction of Gasworks," by R. Marsh, C.E.; Weale's Series; Crosby, Lockwood, and Son; 5s. 6d. 3. "Sanitary Engineering," by Baldwin Latham, C.E.; E. and F. N. Spon; 30s. "Sewage Disposal Works," by W. Santo Crimp, C.E.; W. Griffen and Co.; 30s. "Drainage Work," by W. H. Maxwell; St. Bride's Press; 1s. 6d. There is no work on slaughter-houses, but Bulnois' "Municipal and Sanitary Engineer's Handbook" has a chapter on the subject, which deals with all the essential points; E. and F. N. Spon; 15s. You could obtain second-hand copies of the expensive books.

BISHOPSGATE CHAPEL, erected in 1837 for a church originally founded in 1700, has just been renovated at a cost of nearly £1000.

THE American slate industry is to receive help from English money, a Company of English capitalists having been formed to develop the trade abroad. Some members of the Company are now visiting the slate producing region of Pennsylvania in furtherance of the project.

Correspondence.

FIRE PREVENTION.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have the pleasure of handing you some particulars of the British Fire Prevention Committee, the idea for which originated in connection with the Paris Charity Bazaar fire, and the arrangement of a British representation at the impending International Fire Congress to be held in the French Capital. The encouragement the proposals of the executive received led to an extension of the Committee's programme, when the general question of fire prevention in this country was given precedence to any special question of safety at public entertainments or the representation at Paris. Thanks to the assistance of several of the members, the work could be quietly but surely mapped out, but had it not been for the serious conflagration in the City, some weeks would yet have elapsed before venturing to call your attention to the Committee's purposes.

As it is, I, however, consider the recent fire in the City a sufficient reason to inform you that active steps are being taken to deal with the question of fire protection from a more serious view than has hitherto been the case, and primarily from the aspect of fire prevention. There is no doubt that the majority of our fires could be prevented, and their extent could certainly nearly always be limited with the aid of better planning and construction, no matter how excellent and efficient the fire service is. It is quite unnecessary that we should have so many outbreaks occurring, and when they occur that we should handicap our gallant firemen in extinguishing them as we do at present. The question of fire prevention has so far been much neglected.

The objects of the Committee have been made known, but I should perhaps add that one of the principal ideas in forming the Committee was to avoid any one of the many conflicting interests being treated in a one-sided manner. This is the reason why the various vested, commercial, as well as the professional and official interests, will be represented on the Committee. The difficulty of obtaining independent opinions regarding measures, methods, or appliances for minimising fire risks, is also one of the reasons for the formation on its present lines.

Perhaps I should add that the original members already number nearly 200; that the publications of the Committee have commenced, among those in preparation being papers by the architect to the L.C.C. (Mr. Blashill), Mr. Darbyshire, F.S.A., of Manchester, Mr. Farrow, F.R.I.B.A., and Mr. Max Clarke, as well as several summaries of foreign legislation and parliamentary proceedings and extracts from the English, Continental, and American literature on the subject.

Again emphasising that this body is primarily intended for taking up the question of fire prevention as distinct from its extinction, and thinking that if the architectural circles were really to give their serious attention to the question, fire losses might materially be reduced.—I am, dear Sir, yours very truly,

EDWIN O. SACHS,

Chairman of the Executive.

Waterloo Place, Pall Mall, S.W.

Notice to London and Provincial Readers.

The Editor of the "Builders' Journal"

will at all times be pleased to receive and consider articles of a professional or technical character suitable for these pages. Papers read before Architectural bodies will also, if forwarded, receive careful consideration.

Trade and Craft.

ASPINALL'S "WAPICTI."

The name of "Aspinall" is quite a household word, and its association with the famous firm's latest decorative material, "Wapicti," promises to become just as well known as with the firm's enamel. Anything of real decorative merit which tends to the beautifying of our homes and public buildings, either internally or externally, deserves careful attention on the part of those in whose hands the beauty—or otherwise—of our buildings lay; and it is a matter of satisfaction that here, as in all Nature, we have the "survival of the fittest." Aspinall's, we doubt not, owe their popularity to this simple fact, and their "Wapicti" is the latest proof of it. Its artistic merits having been recognised, it has met with a welcome at once cordial and hearty. We have lately had the pleasure of looking at several jobs which have been done with this preparation. Amongst others, we may specially refer to 103, Cannon Street, where the whole of the outside has been done in a Portland cement colour; the effect is in every way worthy of the decorators and manufacturers. Messrs. Aspinall have a special method of preparing the material for outside work, which renders it proof against the elements. Again, at the Royal Albert Hall, "Wapicti" has been used for the re-decoration of the bays, and the result is in every way satisfactory. In this case, "Wapicti" is employed for the filling, and the firm's special decorator's enamel for the dado and skirting. As an artistic and effective wall decorator, "Wapicti" stands in the fore-front, and combining the properties of an anti-septic agent and strong disinfectant, it is the desideratum of the decorating trade. For the walls of mansions, hospitals, schools, and all large surfaces requiring to be neatly and aesthetically treated, it is especially suitable, and may be used with eminently satisfactory results. "Wapicti" can be manufactured in any tint, and is adapted for application to plaster, stucco, brick, stone, cement, wood, &c. On exterior work, it dries with an impermeable surface; the general effect is superior to that of flatted paint, and besides, it is more economical; it is about one-third cheaper. The best testimonial to "Wapicti" lies, we think, in its own application.

SANITARY BYE-LAWS AT BIRMINGHAM.

At the Birmingham Police Court recently, Stephen Blundell, builder and contractor, Blundell Road, Sparkbrook, was summoned by the Corporation for erecting houses in Charles Road, Small Heath, and neglecting and refusing to provide suitable drain-traps in the house connections with the drains; and, further, for refusing to provide at least two untrapped openings for the purpose of securing sufficient ventilation in each house, as required by the bye-laws. On January 16th last defendant submitted, by his architect (Mr. Hamblin), plans for the erection of certain houses, commencing with the thirty-fifth house in Charles Road, on the west side from Bordesley Green, and on January 19th those plans were disapproved by the Corporation on the ground of certain defects. The plans were again submitted on January 25th, and again on February 1st were disapproved. On that day, or shortly afterwards, an interview took place between the city surveyor and Mr. Hamblin, and the latter made certain alterations which justified the Corporation in approving the plans on February 5th. On February 28th the Corporation received a letter from Mr. Barber, defendant's solicitor, in which he renounced the authority of Mr. Hamblin to make the alterations in question. Mr. Barber sent to the Corporation addenda to the plans indicating the position of the drainage which he thought ought to be approved by the Corporation. On March 2nd those plans were disapproved, but in spite of this the building was commenced on March 9th. On June 6th notice was given that the drains were ready for inspection, and a visit was paid to the property. It was then found that the drainage system as laid down

was not in accordance with the plans approved by the Corporation, but in accordance with the addenda which had been disapproved by the Corporation. On August 5th fresh plans were submitted, and again disapproved; and an interview with the Health Committee failed to bring about an acceptable arrangement. For the defence, Mr. Hamblin, who acted as architect for defendant, said that up to the coming of Mr. Price the Corporation allowed blocks of houses to be drained with one trap. Mr. Price, rightly or wrongly, now insisted upon one trap for each house. Dr. Bostock Hill, also called on behalf of defendant, said that he had inspected the houses, and in his judgment, as at present erected, there was no defect in their sanitary arrangement. The Bench imposed four penalties of 20s. and costs each in respect of two houses.

ANNAN'S ANTI-ACCIDENT APPARATUS.

In these days of lofty buildings, towering blocks of flats, etc., rendered necessary by the limits of building areas, and the cost of ground in our large cities, we look to the genius of the inventor and patentee for the means whereby the safety of those on whom necessity enforces the endangerment of life and limb in the service of others may be assured. The advent of any new patent offering a safeguard against such risks should be hailed with pleasure. We have recently received a specimen of Mr. D. Y. Annan's Patent Anti-Accident apparatus, which appears to us to meet a requirement that has long been wanted. The patentee describes it as eminently suitable to all classes of existing or new windows, and as easily adaptable thereto. Another feature which recommends it is its cheapness. The apparatus is also easily removable, and applied to each window successively as required. The apparatus consists of a pair of hinged flaps of brass or other suitable metal, having two elongated slots on one leaf and one on the other. These are fixed to the inside lining or batten rod by screws. The sash is lifted sufficiently to well clear the inside bead of sill, and screws inserted in the sash opposite the single slots on the hinges into which the heads are passed. The inside bead or batten rod on the opposite side of sash frame to the hinges above mentioned is now cut diagonally across a little above the top of lower sash. The upper portion is then turned, or pivotted by inserting a screw in the centre of same. The lower portion is then fitted with screws at intervals, which are so arranged as to fit into small plates sunk flush into the wood, screwed into the end of lining and so regulated as to engage with the screws by means of the slots in same. Two screws are then inserted in any convenient position to secure the sash cords. The lower sash can then be swung inwards for cleaning. The upper sash is now lowered to the position of the lower sash, so that the top of each is level, screws are then inserted in pairs (one in each sash), and the clip plates (pivotted and slotted) are fitted to the screws and closed. Next cut the parting bead about 9in. from the top of window and fix the knuckle joint provided for the purpose. Secure the lines in similar manner to that described for the lower sash. The two sashes are now fixed together, and can be swung inwards. To refix the parting bead, a plate is inserted in the woodwork behind same, and a screw head fitted to the back of the parting bead, which engages with a slot in the plate. That portion of the parting bead above the knuckle-joint should be nailed to the framing. The invention is really in two distinct portions, viz., that which is usable for all the windows in turn, and comprises the two swinging hinges and the pivotted clips, with the cone-headed screws for same; and that portion which is a fixture for each window, comprising the slotted plates attached to the framing for engaging the parting and inside beads where cut on the right side of the window. For simplicity and efficiency we commend this ingenious apparatus as a distinct improvement on existing methods. The apparatus is procurable from the inventor, Mr. D. Y. Annan, of 42, Barrack Street, Dundee.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BRIGHTON.—For alterations and enlargement of the Queen's Park School, for the Brighton and Preston School Board, U.D. Messrs. Thomas Simpson and Son, surveyors, 16, Ship-street, Brighton:—
W. Brown and Son, £2,614 0 | W. Field and Co., £2,336 0
J. Longley and Co., 2,582 0 | G. R. Lockyer, 2,252 15
C. E. Kemp, 2,481 0 | Lattin & Evershed, 2,238 0
P. Peters and Son, 2,350 0

DEVONPORT.—For the construction of sewers, &c. Mr. John F. Burns, borough surveyor, Municipal Offices, Devonport:—
J. Shaddock, £2,227 | A. Thomas, £1,472
T. Lang and Sons, 1,825 | T. Shaddock, Ply-
mouth, 1,415
H. E. Skinner, 1,735

GREAT AYTON (Yorkshire).—For Great Ayton sewerage and sewage disposal works, for the Stokesley Rural District Council, Yorkshire. Mr. H. W. Taylor, engineer:—
Parker and Sharp, £4,942 | G. Robson, £3,881
Curry and Son, 4,449 | J. Carrick, 3,767
T. Pearson, 4,163 | T. Hunt, 3,760
F. N. Simpson, 4,101 | Cruddas and Son, 3,419
KEIGHLEY.—For the erection of store, Lawkholme-lane, for the Keighley Industrial Co-operative Society, Limited. Mr. John Haggas, architect, North-street, Keighley:—
Masonry.—Henry V. Robinson
Slating.—William Thornton
Plastering.—Joseph King
Plumbing.—J. W. Clough

LONDON.—For rebuilding stables, Nos. 12 and 15, Gower-mews, W.C., for Mr. W. H. Woods. Messrs. Clark and Hutchinson, architects, 28, John-street, Bedford-row, W.C. Quantities supplied:—
Courtney and Fairbairn, £1,717 | Alfred Bush, £1,699
John Anley, 1,714 | H. Burnham & Sons, 1,682
Patman & Fotheringham, 1,710 | William Antill & Co., 1,650

LONDON.—Accepted for alterations to No. 46, Chandos-street, Charing Cross, W.C., for the Directors of the Lyric Stage Academy, Limited. Messrs. Clark and Hutchinson, architects, 28, John-street, Bedford-row, W.C.:—
Tipton, £235
LONDON.—For electric wiring, Guildhall School of Music Extension:—
Vaughan & Brown, £750 0 0 | B. Phipps and Co., £464 0 0
Drake and Gorham, 738 18 0 | C. A. Heddingway, 405 7 6
Wenham & Waters, 579 0 0 | Gulich & Macintyre, 392 4 6
R. Dawson, 507 12 0 | Johnson & Phillips, 357 0 0
Lund Bros., 495 0 0 | Berghie & Young, 342 15 0

LONDON.—For heating, &c., Guildhall School of Music Extension:—
Rossor and Russell, £1,800 | Wenham and Waters, £1,063
Kinnel, 1,150 | Waller and Co., 980
W. J. Fraser and Co., 1,142 | Finch and Co., 797
Haden and Son, 1,076 | W. Smith, Gray & Co., 744

LONDON.—Accepted for erection of semi-detached houses in Sunray-avenue, Denmark Hill, S.E., for Messrs. Richard Ellis and Sons and others. Mr. Edward B. Ellis, architect, 18 and 19, Fenchurch-street, E.C.:—
W. D. Palmer, £5,933
ALDERBURY.—For alterations and repairs at the "Galatea," Albermarle-street, S.E., for the New Westminster Brewery Company. Mr. H. E. Budd, surveyor, 78, Vincent-square, Westminster, S.W.:—
Drew and Cadman, £268 | H. Eames, 135, Hill-
Prestage and Co., 631 | street, Peckham, S.E., £255
King and Son, 610

LONDON.—For additions to printing warehouse, Northumberland-alley, Fenchurch-street, E.C., for Messrs. Smith and Ebbs. Mr. Money Marsden, architect, 40, Great Tower-street, E.C. Quantities by the architect:—
J. Turnbull and Son, £2,260 | John Sparks & Sons, £2,075
John Outhwaite & Son, 2,100

LONDON.—For rebuilding house, High-street, Bromley, E. Messrs. Foulsham and Herbert Riches, joint architects, 3, Crooked-lane, King William-street, E.C., and Bromley-by-Bow, E.:—
J. T. Robey, £724 | Howlett and Sons, £665
S. Salt, 705 | A. J. Sheffield, 650
J. C. Edmunds, 682 | T. Osborn and Sons, 598

LONDON.—For part rebuilding and alterations to "The Seabright Arms" public-house, Hackney, N.E. Messrs. Foulsham and Herbert Riches, joint architects, 3, Crooked-lane, King William-street, E.C., and Bromley-by-Bow, E.:—
F. and F. J. Wood, £1,460 | S. E. Todd and Co., £1,367
S. R. Lamble, 1,458 | G. A. Markham & Son, 1,171
J. Anley, 1,494 | A. Hood, 1,165

LONDON.—For pulling down and rebuilding front portion, and for bar fittings &c., at "The Rose and Crown," Ilford, E. Messrs. Foulsham and Herbert Riches, joint architects, 3, Crooked-lane, King William-street, E.C., and Bromley-by-Bow, E.:—
T. E. Mitchell, £3,138 | J. and H. Cocks, £2,923
W. Shurmer, 2,890 | W. Watson (accepted), 2,870

LONDON.—For new fittings, &c., to shops, High-street, Deptford. Mr. Herbert Riches, architect, 3, Crooked-lane, King William-street, London, E.C.:—
Hall Bros., £247 | Spreckley and Co., £275
Calnan and Co., 285 | W. Peck and Co., 232

LONDON.—For new shop front to shop, Chapel-street, Islington, N. Mr. Herbert Riches, architect, 3, Crooked-lane, King William-street, London, E.C.:—
G. Lyford, £231 | W. Peck and Co., £117
Spreckley and Co., 216

LONDON.—Accepted for repairs to "The Prince of Wales," Stratford, E. Messrs. Foulsham and Herbert Riches, joint architects, 3, Crooked-lane, King William-street, E.C., and Bromley-by-Bow, E.:—
W. D. Dely, £131 12 0

LONDON.—Accepted for the erection of seven houses, Manor Park, for Mr. G. Cason. Mr. J. Walter Wyles, architect, 17, Finsbury-pavement, E.C., and Manor Park:—
J. W. Thornton, Upton Park, £1,400

LONDON.—Accepted for the erection of factory at Blenheim-road, Upper Holloway:—
A. Heard and Co., £1,728 19

LONDON.—For the erection of new stables at Horney-lane, Bermondsey, for Messrs. E. Ellis and Co.:—
Shepherd, £575 | Ellis Stanley, Guildford, £529

WELLS.—For re-constructing the male and female infants' offices, erecting closets for masters and schoolkeeper, and providing part new drainage scheme, at the London Fields Schools, for the London School Board. Mr. T. J. Bailey, architect:—
J. Wilmott and Sons, £1,772 | G. S. S. Williams and
J. Grover and Sons, 1,710 | Son, £1,359
E. Lawrence and Sons, 1,608 | Johnson and Co., 1,351
Stevens Bros., 1,628 | R. A. Yarbury & Sons, 1,281

RECOMMENDED FOR ACCEPTANCE.

MARLBOROUGH (Wiltshire).—For the erection of County Police Station, for the Standing Joint Committee. Mr. C. S. Adye, County Surveyor, County Offices, Trowbridge:—
Hughes and Weeks, £4,380 0 | Hayward & Wooster, £3,750 0
B. Hillier, 4,040 0 | W. E. Piper, Marl-
Downing & Rudman, 3,900 0 | borough*, 3,598 0
H. Hoskings, 3,890 0 | G. Moors, 3,316 10

PLYMOUTH.—For the erection of poultry, vegetable, fruit, and fish market, &c., being contracts Nos. 8 and 9 of the Plymouth Corporation Markets. Messrs. King and Lister, architects, 8, Princess-square, Plymouth. Quantities by the architects:—
J. Finch, £12,939 | A. R. Lethbridge and
A. W. Coles, 11,062 | Son, £10,519
Matcham and Co., 11,140 | Wm. Trevena, Ply-
mouth*, 10,228
J. Goad and Son, 11,149
P. Blouey, 11,063

PONTEFRAC.—Accepted for workhouse extensions, Pontefract Union, for the Board of Guardians. Messrs. J. Holmes, Greaves, and Co., architects, Leeds, Pontefract, and London:—

New Laundry Buildings.

Excavating, Bricklaying, and Masonry.—
Jackson Bros., Goole, £1,620 0 0
Carpentry and Joinery.—Jackson Bros.,
Goole, 311 0 0
Plumbing and Glazing.—G. Thompson,
Leeds, 90 0 0
Slating.—Jackson Bros., Goole, 109 10 0
Plastering.—O. Lister, Ilkley, 23 7 4
Painting.—H. Butler and Sons, Ponte-
fract, 61 5 6
Hot Water Engineering.—A. Wougill and
Co., Leeds, 51 0 0
Laundry Machinery.—T. Bradford and
Co., Manchester, 927 0 0
Ironfoundry and Smithing.—Jackson
Bros., Goole, 411 0 0
Engines, Boilers, &c.—Marsden and Co.,
Heckmondwike, 491 10 0

Male and Female Fagant Wards.

Excavating, Bricklaying, and Masonry.—
Jackson Bros., £2,751 10 0
Carpentry and Joinery.—Jackson Bros.,
Goole, 417 0 0
Plumbing and Glazing.—G. Thompson,
Leeds, 313 0 0

MODERN SANITATION.

By H. A. SAUL.

(Continued from page 287.)

V.

THE descriptions in the present series have hitherto been made to apply only to small dwellings, in order that the leading principles of Modern Sanitation might be easily explained and their application readily shown in connection with systems of drainage of a not too elaborate nature.

Plan No. 5 shows the drainage of some warehouse premises recently carried out by the author in the City of London, and has been chosen as the subject of this article on account of the more elaborate nature of the scheme and of its possessing several matters which have been untouched upon in the previous descriptions. The quality of the work, moreover, is of a better nature, and relative to the cost and manner of the building to which it appertains.

The main points in which this scheme differs from the former ones are these:—

Rain water and waste pipes do not discharge directly into gullies placed at feet of same.

The main drain is composed of heavy cast-iron pipes.

The manhole channels are of earthenware.

Soil pipes are of lead.

In town buildings of the warehouse class the only course usually possible, in dealing with

external walls as far as the ground level, where (if there are no areas) they would be taken by an easy bend to the inner face of the wall as above described.

The usual method of connecting the feet of rain water and waste pipes to ordinary gullies cannot be adopted in cases of this nature if a comparatively permanent efficiency is required, as the gully gratings would soon become broken by the heavy wear to which a warehouse basement is usually subjected, and the gullies themselves choked up with dirt in a few months, or else covered with goods to the complete detriment of ventilation. In the case under consideration all these pipes, with only one exception, have been continued beneath the ground to a small circular collecting chamber at the head of the manhole. This chamber consists of two parts, the upper constructed of brickwork faced with cement, into which the drains are taken, and the lower of a circular trapped gully similar to those used in roads, the trap of which is connected to the manhole. The chamber is fitted with a closed top, and ventilation is obtained by means of an ordinary mica flap inlet valve fixed above the floor to the nearest wall, and connected to the upper part of the chamber. Figs. 1 and 2 are a plan and section of the collecting-chamber, showing its connection with the manhole. Fig. 3 shows the means of inspection which is placed at the junction of the vertical with the horizontal pipes, and which enables a stoppage to be easily located and removed without the necessity of hacking up the floor and breaking into the drain.

The drain which runs from manhole to intercepting chamber has been constructed of heavy cast-iron pipes, jointed with lead to obviate the risk of fracture or breakage from the jar of heavy goods or the vibration of machinery immediately above it. The pipes, previous to laying, had been coated within and without with Dr. Angus Smith's solution, a preparation which renders the iron proof against rust and corrosion.

The inside walls of manhole and intercepting chamber are faced with white glazed bricks, the channels in same are of white glazed stone-ware bedded in concrete, and the bottom is finished with cement, trowelled smooth and having falls to the channels, as described in the previous description of manholes.

The soil-pipe is of drawn lead 4in. in diameter. The following table of relative sizes and weights of soil-pipes is an extract from the Bye-laws made by the London County Council, under the Public Health (London) Act of 1891, Section 39 (1):—

DIAMETER.	LEAD.	IRON.
	Weight per 10ft. length not less than	Weight per 6ft. length not less than
in.	lbs.	lbs.
3½	65	48
4	74	54
5	92	69
6	110	84

By a provision of the same Bye-laws, the trap of any water-closet, which water-closet is itself in connection with any other water-closet, must "be ventilated into the open air at a point as high as the top of the soil-pipe, or into the soil-pipe at a point above the highest water-closet connected with such soil-pipe, and so that such ventilating pipe shall have in all parts an internal diameter of not less than

2in., and shall be connected with the arm of the soil-pipe at a point not less than 3in. and not more than 12in. from the highest part of the trap, and on that side of the water seal which is nearest to the soil-pipe." This matter will be dealt with in full in the next article in connection with the subject of anti-siphonage.

the vertical draining pipes, is to carry them down upon the inner face of the basement walls, there to be connected to the manholes constructed in the floor of the basement itself; in fact the process consists of turning the formerly described methods inside out, or more properly speaking, outside in. Where possible all vertical pipes, especially soil-pipes, should be run upon the outside faces of the

SURVEYORS' INSTITUTION.*

PRESIDENT'S ANNUAL REVIEW.

THERE has been very little legislation in the past session affecting our Profession. The Extraordinary Tithe Act, 1897, settles two doubts which had arisen under the Extraordinary Tithe Redemption Act, 1886, and enacts that any rent-charge certified by the Land Commissioners or the Board of Agriculture shall be a charge on the whole farm or parcel of land described in their certificate; and also enacts that any such rent-charge may be apportioned in the same way as ordinary tithe rent-charge, and when apportioned, any part may be separately redeemed. The Market Gardeners' Compensation (Scotland) Act, 1897, applies the Market Gardeners' Compensation (England) Act, 1895, to Scotland. The County Dublin Surveyors' Act, 1897, refers only to the appointment of the county or district surveyor and his assistant surveyors. The Public Offices (Whitehall) Site Act, 1897, authorises the purchase for the site of a new War Office of the block of buildings north of the vacant land on which Lord Carington's house formerly stood, including several houses in Whitehall and the south side of Whitehall Place. This clearance, in addition to the removal of the west side of Parliament Street now in progress, will tend to increase the difficulty and the cost of obtaining professional offices in Westminster.

THE AGRICULTURAL RATES ACT, 1896,

has given rise to many difficult points, and to much recent discussion thereon. These, I think, will have to be dealt with chiefly by local rating and other surveyors. The main question seems to be, when is "agricultural land" not "agricultural land" as it is defined in Section 9 of the Act? According to the latest decision, it appears that market gardens and nursery grounds covered with glass are still "agricultural land" and not buildings, but this question may yet come before the House of Lords. Tithe rent-charge does not get the benefit of this Act, which seems to be a great hardship on the clergy, as tithe issues out of and is really a part of land. I trust I may be excused for referring to a most interesting and instructive book published this year, and written by our distinguished honorary member, the Duke of Bedford, called "The Story of a Great Agricultural Estate." The result

* Extracts from the opening address of the session, delivered by Mr. Christopher Oakley, at the opening meeting of the Surveyors' Institution.

of the figures therein made public is surprising, namely, that as to the

WOBBURN OR BEDS AND BUCKS ESTATE,

comprising over 32,000 acres, the expenditure thereon in seven years (including the last three years) out of the twenty years between 1876 and 1895 exceeded the income by a total of £38,954, and that in the Thorney estate, during the same time, the expenditure exceeded the income in five years (including the last two), showing a total deficit of £9899. But I refer to this book chiefly to point out that it seems to me to be a complete answer to those who advocate the breaking up of large estates into numerous small ones for the benefit of the community at large. It is beyond question that no small landowners could have spent anything like the sums on their property which the Dukes of Bedford have expended during the last century. This vast outlay is spent in the district in which the estates are situated, and must tend to the advantage, comfort, and well-being of all living thereon and the tradesmen of the locality generally. It may be interesting to many to inquire how agricultural depression has affected the sale and price of land. With that object in view, the secretary of the Estate Exchange has been good enough to get out for me the following figures from the register kept of sales. These figures are in continuation of those given by my predecessors, Mr. Beadle in 1886, and Mr. Watney in 1895, in their opening addresses. Return of sales of landed property of 100 acres and upwards outside the Metropolis (taking a radius of fifteen miles) showing the total acreage, total price realised, and price per acre:—

Year.	Total Acres Sold.	Total Price. £	Price per Acre. £ s. d.
1875	95,894	4,969,783	52 0
1885	31,070	986,253	32 0
1894	11,518	283,201	24 10
1895	36,291	683,104	19 0
1896	77,696	2,327,616	30 0

These figures show a very large increase of acreage sold in 1895 and 1896 compared with 1894, the total for 1895 being more than three times that for 1894, and the total for 1896 being more than double that for 1895. The

FIG. 1

price per acre in 1895 is about 20 per cent. below that for 1894, and on the other hand the price per acre in 1896 is more than 50 per cent. above that for 1895. This large increase, must, I think, be partly due to some sales of land, not strictly agricultural, being included in the return, as the value of land has not increased by one-half. I find it includes the Trafford Park Estate at Manchester. If that is omitted, the £30 per acre will be reduced to about £25, or an increase over 1895 of about 31 per cent. The following table gives the sales of ground rents registered in 1875, 1885, 1894, 1895, and 1896, and shows that though the amount sold has very largely increased, the price realised has increased from 26½ to 33½ years' purchase.

FREEHOLD GROUND RENTS.

Year.	Amount. £ s. d.	Sold for. £	Years' Purchase.
1875	9,498 19 2	251,686	26½
1885	12,298 9 6	342,478	27½
1894	13,518 4 6	376,700	28
1895	18,149 0 0	551,378	30½
1896	24,826 0 0	832,584	33½

The total amount of all sales registered at the Estate Exchange in 1896, for London and the country, both auction and private contract, was £10,554,263. For the first nine months of this year the total is about 6 per cent. larger than for the same period in 1896. I observe that several of my predecessors have dealt in their opening addresses with the "Betterment" question in the various phases it has assumed from time to time. The subject has become somewhat stale, but it may be well just to state how the matter stands at the present moment. The London County Council appear to have got three schemes through Parliament in connection with their Improvements Act, 1897. These three schemes are as follows:—1. The construction of a new street, about 300 yards long, connecting the northern approach to the Tower Bridge, opposite the entrance to the Royal Mint, with Great Prescott Street; 2, the

WIDENING OF THE STRAND

by the removal of the block of buildings forming the south side of Holywell Street; and 3, the widening of the southern end of Tottenham Court Road by the removal of the block of houses forming the east side of Bozier's Court. The conditions as regards "betterment" imposed by the Tower Bridge Southern Approach Act of 1895, i.e.—(a) the confining of "worsenment" to the same area as "betterment," (b) the right of compelling purchase by the Council to be exercisable by the owner within three months of the Council's assessment only, and (c) the consideration of all matters to be left to the arbitrator without the right of going to a jury—apply to all three schemes, but they stand on a somewhat different footing from each other as regards what is known as the

"IMPROVEMENT AREA."

An addition to the Standing Orders of the House of Commons, known as 45B, stipulates that, in the case of Bills containing power to impose an improvement charge, the distance

on each side from the centre line of the new street to which the improvement rate shall apply shall not exceed three times the breadth of the new street (as shown on the plans). In the exercise of its discretion Parliament has allowed the full distance of three times the width of the new street in the case of the northern approach to the Tower Bridge, but in the case of the Strand has strictly confined the improvement area to the houses forming the north side of Holywell Street, and in the Tottenham Court Road improvement, to the houses forming the west side of Bozier's Court, with a few additional houses between the northern end of that court and Hanway Street. The only other cases in which betterment has been sanctioned by Parliament are the County Council's Act for the southern approach to the Tower Bridge, and an Act of 1894 of the Manchester Corporation for certain

IMPROVEMENTS IN THEIR CITY.

In both these cases our member, Mr. James Green, has been appointed arbitrator, and has held various meetings and deposited his valuations. Not less than one nor more than three years after the completion of any of these improvements the Council has to fix the amounts and areas of the charges which they claim, and if they are disputed another valuation has to be made, and the charges for betterment (or worsement if any such claims are made) have to be settled by an arbitrator. Till this has been done, probably five or six years hence, it cannot be known what the practical result of this new mode of dealing with the law and practice of compensation will be. I suppose I ought to say something with reference to our new buildings. In the Council's report in May last it was confidently predicted that the roofing-in would be completed before the winter, but owing to unforeseen difficulties, as regards foundations, a good deal of time was lost which it will not be possible to overtake. The Council has, however, brought

PRESSURE TO BEAR ON THE CONTRACTOR, with the result that rapid progress is now being made, and there seems to be some reason for hoping that a portion of the building will be available early next summer. While on the subject of Institution affairs, I should like to refer to the new Employment Registry which has just been established by the Council. It is hoped that those of the younger members who are seeking employment or desire to improve their position will, in course of time, derive considerable advantage from this new means of bringing them in touch with em-

ployers, and that employers will also find advantage in knowing where to look for qualified assistants. As you have no doubt observed, the Council has taken another very important step in deciding to hold one ordinary general meeting in each session in the provinces, and they have selected Manchester, which is an important examination centre, for the first experiment in this direction. Other parts of England will in turn be visited, and it is hoped that the results may prove advantageous in every way to the best interests of the Institution.

THE Secretary of State for Foreign Affairs has received from her Majesty's Minister at Lisbon copies of a Royal decree of the 5th November, inviting tenders, to be received by 5th January next, for the construction of the sewerage and drainage works and sanitary improvement of the city of Lisbon. The conditions of tendering may be inspected at the commercial department of the Foreign Office any day between the hours of 11 and 6.

APPLICATION is about to be made to Parliament for powers for two important schemes of harbour improvement on the Moray Firth, for both of which Mr. James Barron, C.E., Aberdeen, is acting as engineer. These harbours are Macduff and Buckie, and at each of these places the question of extension has been one of long standing. The scheme, for which Mr. Barron has prepared plans, is mainly directed to the deepening of the harbour and the extension of the west pier into deep water. The excavations will be carried out in all the three harbours or divisions of the port, and will ensure a depth of 16½ ft. at high-water of spring tides. The extension of the pier will provide berths for steamers, to which the harbour has hitherto been practically inaccessible. The estimated cost of these works is about £20,000. At Buckie an almost equally extensive scheme of improvement is being carried out. The Act which is now being applied for provides for the bettering of the harbour at a cost of about £15,000. According to Mr. Barron's plans, the east breakwater is to be extended in a westerly direction 100 ft., and a new jetty, 120 ft. long, constructed from the west pier into the outer harbour basin, the object of these two works being to provide better shelter for the harbour. The outer harbour is also to be excavated to a depth of 18 ft. below spring high water, so as to make it available for boats at all states of the tide.

Surveying and Sanitary Notes.

"LONDON a Million Years Ago" was the subject of a lecture delivered recently at the Bishopsgate Institute. The various strata beneath London, from the chalk upward, were dealt with in turn, as well as the physiographical conditions under which they were deposited, and the probable duration of the process. The chalk extending beneath London was shown to be an oceanic deposit, and a necessary deduction from this was that the nearest land surfaces were hundreds of miles away when the deposition took place. A beautiful seascape, most artistically coloured, was exhibited as representing the sight of "London Long Ago," and, by way of contrast, a picture of a bustling scene at Ludgate Circus followed. The composition of chalk and the formation of flints were explained, and the rate at which the chalk accumulated was discussed. Then, the lecturer stated, came a time when the ocean had begun to rise, and the chalk emerged from beneath the water and became dry land. But that was not for long, as a downward movement caused water once more to flow over that area, and the sand now known as the "Thanet Sand" was deposited. As that sand consisted of grains of quartz, it must have been brought from some distant land. It was mentioned that the loamy base of that bed of sand was useful for foundry purposes, and that its presence near the surface round about Woolwich determined the location of the Royal Arsenal there. Thus were the beds next in order, known as the Woolwich Beds, accounted for, as well as the Blackheath pebbles, which formed part of a bed extending from Herne Bay to Croydon. Those pebbly beds were old sea-beaches, which, by their incoherence, had spread out into level tracts, the unsuitability of which for agricultural purposes had led to their remaining uncultivated and unclaimed. Now that such areas were largely in demand for building and other purposes, the action of the County Councils, in preserving such places for the benefit and enjoyment of the people, was highly commended. The interest of the lecture culminated in an account of the formation of the London clay, and of the animals and plants which existed in the sea which then flowed over the site of London and on the land from which the materials of the clay were derived.

An Architectural Causerie.

Some Anticipated Regrets.

ONE remarks with a rising concern the gradual development of those various schools, studios, and classes which of late years have so multiplied for the instruction and preparation of embryo architects aspiring to the Profession. The usage is a sign of the times; it is a scion of that general supremacy of the diploma. The wise young man of these days, in the majority of the professions and trades, does not aspire to knowledge and power, to confidence and dexterity, or ingenuity in the business of his life, but rather to certificates and diplomas, which state, above authoritative signatures, that the above-mentioned wise young man has taken a certain course, attended a certain series of lectures, and qualified by examination. The system strikes one as being ludicrous and pernicious—as though a soldier should undertake the service of his country for the medals to be won therein. The characteristic influence that makes (and mars) this, our nineteenth century,—as it will be viewed by posterity—is Steam. Fabrics, Furniture; all the Crafts, and Architecture, Painting and Sculpture themselves, have yielded in greater or less degree to this steam-bred greed for the cheap and the meretricious. It would seem, now that vulgarity has exhausted itself in this direction, and a healthy reaction has set in for the genuine rather than the sham article—that we are to have a sort of steam-made profession. Possibly the professional, a man of the distant future, will compare with his brother of the past, somewhat as cheap linoleum now does with the oak parquetry it is meant to suggest; he will be superficial, pedantic, and lacking in that personal force and individuality which is the chief prerogative of manhood. The men who think, and experiment, and formulate and contribute ideas to the Profession, will rather be those who manage and direct these huge rival academies—incubators we may call them—which will then be engaged in manufacturing and hatching out the practitioners of the various trades and professions. The raw youth will be put in at one end and, if he has the *calibre* to survive the sifting and testing processes of the mechanism, will, in course of some five years, be ejected at the other end as a hall-marked authenticated member of his elect profession. Whatever advantages the system may be supposed to hold, the disadvantages remain sufficiently manifest. A young man who is subjected to an all-absorbing course of study by operating step by step and month by month for a period of five years, completely filling his time and coercing his inclination, must emerge at the conclusion, whatever his natural predilection may have been in the original instance, more or less of a pedant; a creature trained in a habit of mind in diagonal antithesis to original thought or enterprise of ideas. Now, if these qualities are, in some of the professions, over-balanced by the advantages of the system, it is certainly not the case with Architecture. This is surely beyond all dispute, but as any particular consideration of the question brings us very near to the yawning brink of “Architecture, an Art or a Profession?” one begs permission

to leave this side of the question. What one may well refer to, however, is the exact origin and explanation of this extraordinary activity in the direction of architectural education. It has arisen no doubt from the strong favour which the examination of the R.I.B.A. has found among architects. The distinction of being an associate of that body and the implication of professional qualification associated with it, is already beginning to be regarded as the recognised test with the general public. It is looked upon as the acknowledged diploma of professional efficiency. But what, in its turn, is the *raison d'être* of the examination—of the diploma. It is stated to be the “protection of the public.” This strikes one as being delightfully quaint and ingenious. The idea of that rampant vandal, the British Public, being protected—and by architects of all men—is a deliciously high-flavoured irony, whose equal one can scarcely call to mind. One has always tasted a pleasant consolation as one hurried askance through a rank crop of the

MODERN ARCHITECTURAL PROBLEMS.*

AS ILLUSTRATED BY SOME EDINBURGH BUILDINGS.

BY PROFESSOR G. BALDWIN BROWN.

ONE of the foremost questions of the hour on the artistic side of Architecture is that of the meaning and value of architectural styles in modern practice. The younger members of the Profession are asking themselves: What are our obligations to the styles of the past? How far are we bound to make our work conform to types established by the practice of bygone ages? Have the old words, Classic, Gothic, Renaissance, and the like, any real meaning for the nineteenth century, or is it not rather the case that, as modern requirements must be met by modern

PAIGNTON CHURCH, DEVON. FONT AFTER RESTORATION BY MESSRS. H. HEMS AND SONS.

British Public's “gintee residences,” to think that here, at least, there was a fair and equitable balance in the generally inexplicable orderings of Nature. The man who had such execrable vulgarity of sentiment as to rent one of these advertisements of gentility (?) and the horrid taste to admire their pinchbeck qualities of design, at least ran the distinct risk of having his family decimated by disease, his head broken by a falling tile, and of getting his leg fractured in the dark by the collapse of his front steps. There is so little of poetic justice in the world that it goes straight to the place where one's heart ought to be to see any body of men—least of all architects—meddling with this happily-ordered instance of it. Besides, the estimable B.P., as exemplified in the “gintee resider,” will have bad design; and he sturdily refuses to accept a design of inferior vileness. B. C.

means, it is time for the architect to come out from under the shadow of these antique conventions and to work out the solution of the problems about him in his own way? A word or two may be said on the general subject of architectural styles and on the part they have played in the practice of the past.

ARCHITECTURAL STYLES.

A “style” may be roughly defined as a particular method of construction, by which parts are put together in a certain scheme of proportion and accentuated by details of marked character, the whole being repeated within certain limits of variation in all the buildings of particular countries and epochs. This repetition within certain limits of variation is the fundamental fact in archi-

* Extracts from an address delivered before the Edinburgh Architectural Society on December 1st.

tectural history. The limits of variation have been wider than has often been supposed. Even in the case of the so-called classical "orders" there was much more fluidity in the forms, more life and movement in the way they were used, than students have sometimes been taught to believe. The fact is, the cut-and-dried schemes of the "orders" do not correspond with the real facts of antique Art. It is difficult, indeed, to find any one measurement on the monuments that corresponds with what Vitruvius gives in the particular case as the norm, and a false impression of Greek Architecture has been derived from studying it in the schemes of the "orders" drawn up largely under Vitruvian influence, by architects of the later Renaissance. The repetition in question has, however, been maintained with curious persistency through long periods of time. Features have been modified from age to age, but we seldom find a new one invented. Architects in the present day may rebel against having to use conventional forms handed down by tradition from by-gone years, but it is only what has been done regularly by their brethren of the past. To follow a style, that is to employ old forms instead of casting about for new ones, has been the rule in architectural practice, and there is a reason for this that carries us back to the essential character of the architectural Art, though it is one that the practitioner may not always have formulated to himself.

SECRET OF ARCHITECTURAL EFFECT.

The secret of architectural effect is not to be found in the forms themselves, but in the manner in which they are employed. There is a distinct advantage in the use of well-understood conventional features. The spectator takes these as a matter of course, and his attention is not specially directed to them as they are in themselves, but only to their effect in combination. They are like the words in poetry. A poet does not invent a new vocabulary when he wants to write a poem. He builds up the structure of his verse out of the familiar words of daily intercourse. If these words were not well understood the hearer's attention would be distracted by curiosity about them, and the music of the verse and the import of the thought conveyed would be lost to him. It is the relations of parts in the structure that is the important matter in the effect of Architecture. The artistic impression of an architectural monument depends largely on the sub-division of the mass into parts related to each other, and to the whole in a carefully designed scheme of proportion. As the sub-division must depend on the internal arrangement of the structure, and this on the purpose and use of the various portions, the question of planning is brought into intimate connection with the more artistic aspects of design. Planning will suggest the sub-divisions, but these will have to be worked out at the same time with strict regard to aesthetic demands. When this has been accomplished the eye balances part against part, and is satisfied if the relations of size and shape and position have been duly adjusted. The familiarity of the forms enables the eye to judge these relations in quiet, without any disturbing considerations, such as would come in the way if the forms attracted special attention to themselves.

THE USE OF OLD FORMS.

In this matter a good deal of instruction can be derived from the work of Sir Christopher Wren and of James Playfair. Neither troubled himself much about the character of the forms he used, or felt anything irksome in the "bondage of a style." Wren used the Classic forms prevalent in his own time with considerable freedom, not caring much whether they were new or old, but intensely solicitous about his proportions. The distinction that belongs to Wren's towers and

steeple depends entirely on his fine native sense of proportion, in which few architects have been his equal—none his superior. Much the same may be said of Playfair. He took the style of his time just as it came to him, but the merit of his compositions does not depend on this uniformity. No one looks at Donaldson's Hospital, for example, as an illustration of any particular style; its effect is independent of any such consideration.

PERSPECTIVE VIEWS.

The building has, of course, immense advantages of site and surroundings, and that imposing magnitude which is in itself no small element in architectural effect. Its great merit is, however, the way it is broken up into subsidiary masses, the composition of which seems happy whatever point of view is taken. In these masses the same features are reproduced throughout the building, and the designer has calculated on the variety gained by perspective views from many different quarters. Though the Wren turrets are very numerous and are all alike, yet they never seem to get in each other's way, but have the happiest knack of falling into groups that contrast in size and shape, and secure the effect from any appearance either of monotony or of confusion. These really architectural qualities in a building do not depend on what the details are in themselves, but they are all the more apparent when the details have that general conformity to orthodox practice which keeps them in due subordination. These considerations are in favour of the general principle of conformity to style in architectural practice, but there is a difficulty in applying the principle in the present day. A modern designer might agree about the advantage of employing well-understood forms so as to concentrate artistic effect upon composition, but might point out with reason that it is not possible to build in "style" in the abstract—some distinct style, some connected set of forms, is needful before the advantage can be secured, and it is just this which in modern days is wanting. It is often pointed out, and with much show of truth, that we have now no traditional style to supply us with forms, and that the architectural world is ruled at the present time by a judicious eclecticism, under which architects will erect for us with equal readiness a Gothic church, a classical bank or museum, and a Renaissance mansion. This aspect of pure eclecticism about modern practice is very much the outcome of the repeated artistic "revivals" which have marked the nineteenth century, and have persuaded it that it has no architectural style of its own. These revivals have attracted much attention, because each one came in on the crest of the wave of some movement in the world of ideas, and has been served by devotees and by champions.

THE STYLE OF THE NINETEENTH CENTURY.

The so-called Gothic revival was blessed with a sort of religious consecration, and a most eloquent and enthusiastic prophet in the person of Mr. Ruskin. The "Scottish Baronial" revival was motivated largely by the influence of Sir Walter Scott, who brought mediævalism in its secular aspects so greatly into vogue. Then there has been a classical revival, marked by the use of strictly antique forms—a style of which the High School, Edinburgh, is perhaps the most characteristic. St. George's Hall, Liverpool, the noblest expression. These and other such movements, all of a more or less artificial nature, have driven out of view the fact that after all the nineteenth century has a style, and a very good style, of its own. In Edinburgh this fact is perhaps more easily remembered than it is elsewhere in the country. Here the century opened with a singularly consistent style of Architecture—

the style of Robert Adam, and this style was carried on in the first half of the century by James Playfair and others of the same school. The style they represented was not a revival, but was essentially the style that had originated at the Tuscan Renaissance, and had been practised for the preceding 300 years. The Tuscan architects of the fifteenth century based their work on a revived study of the antique, but they did far more than merely copy classical models. The Tuscan Renaissance really presented the world with the third of the three distinct styles that the civilised West has known. There had existed the Architecture of the colonnade, represented by the classical "orders," and the Architecture of the arch and vault, expressed partly at Byzantium, but most perfectly in French Gothic. Now, the Florentines created the Architecture of the wall and its openings, their treatment of which was something new in architectural history. The colonnade is the negation of the wall, while the tendency of French Gothic is to eliminate the wall, and turn the building into a series of stone canopies, upborne by a scientifically contrived framework, filled in by a light screen of glass. The Renaissance architects, on the other hand, took the wall as the fundamental element in their design. As has been said of them, "all their Architecture is disposed for the main purpose of bringing out into importance the wall in its constructive significance, by dividing it into stories marked by ranges of windows, and by completing the whole structure both below and above suitable plinth and cornice." These Renaissance façades are really the first works of modern Architecture, for they provide a form of building exactly suited to the needs of modern life. Cities began at that period to assume the appearance they wear at present, and the wall with openings to the street or public place is the architectural form that fits best their character. Some of these façades rely for their artistic effect upon the composition of features which are necessary parts of the construction as a thing of use, without borrowing any added features for the sake of mere effect, and they show that it is possible to secure by these simple means both monumental grandeur and a large measure of architectural beauty.

EDINBURGH BUILDINGS.

That this style suited the modern world is shown by its persistence down to our own time. On the one hand it is perpetuated in monumental buildings of which familiar Edinburgh examples are Sir William Chambers' mansion (now the Royal Bank) in St. Andrew Square, Robert Adam's Register House, or his eastern front of the University, or Elliot's, Waterloo Place; on the other hand, it is carried out in humbler forms in the ordinary house-front of our streets. This latter fact is not one to pass by with indifference. In discussing the question of a modern style it must always be remembered that styles are not artificial productions, but are generally evolved in some organic manner from pre-existing conditions. If, therefore, we find a certain method of building so naturally suited to modern conditions of life that it occurs regularly in by far the largest class of buildings erected in our centres of population, this fact may help us to recognise in it a style that is really essentially our own. If out of the elements which we get in a simple utilitarian form in the domestic house-front it is possible to create monumental Architecture, this indicates to the architect of to-day a natural field for the exercise of his gifts. The establishment of a modern style need not imply any heroic effort of invention or boldness of innovation, only the drawing out in an artistic spirit of the possibilities latent in everyday structures of use.

(To be continued.)

THE NEW McEWAN HALL AT EDINBURGH.

[BY A SPECIAL CORRESPONDENT].

EDINBURGH is rich architecturally, and its wealth has recently been augmented. There was opened there last week a notable addition to the University buildings, to wit, the McEwan Hall, so named after the donor, one of the members for the City of Edinburgh. The plan of the Hall is based on the form of the ancient Greek theatre. This form was chosen as best suited for an auditorium, and one likely to ensure

is blank with the exception of one inscribed panel. This section is divided from the upper by a band of Italian ornament, with panels at intervals containing many coats of arms.

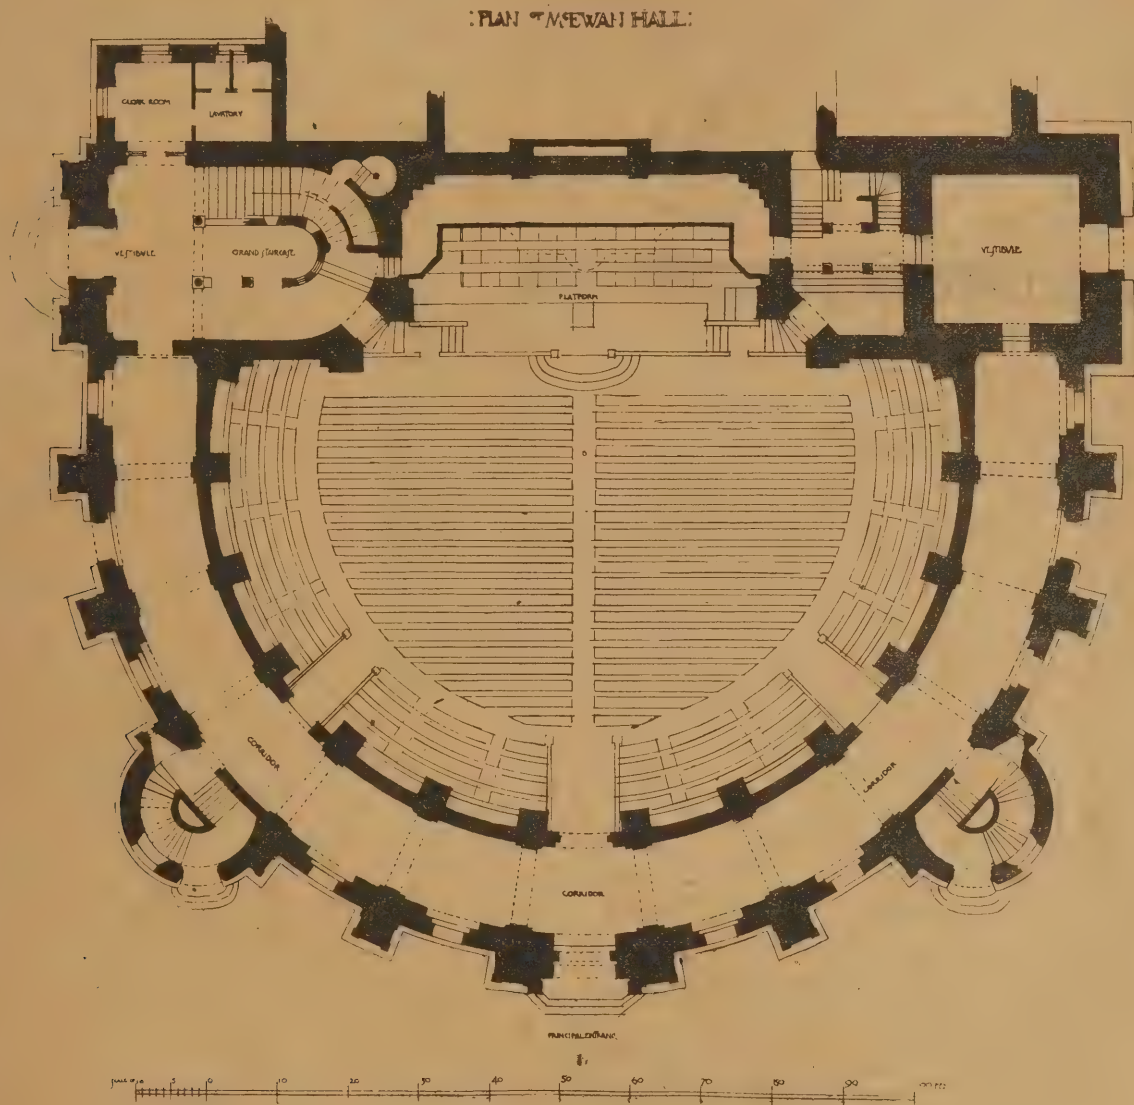

The upper of the three horizontal sections is arcaded in red stone, and is surmounted by an architrave frieze and cornice, and an open balustrade. The height of the outer wall from the base to the top of the balustrade is 64ft. An interior wall concentric with the outer encloses the Hall proper, and rising above the outer wall, to which it is joined by flying buttresses, supports at its summit the dome-shaped steel roof, which is surmounted by an ornamental lantern 30ft. high. The total height from the street level to the top of the lantern is 130ft. The outer

the University which find place on the outside wall. On the mosaic flooring of the landing are panels containing the arms of the donor, the City, and the University.

From the first landing of this principal stair, access is gained to the reception rooms, set apart for the assembling of the Senatus Academicus, distinguished guests, &c.

The staircases leading to the galleries are placed in the round projections at the south and north-east angles of the building.

Two staircases are placed in each projection, one leading to the first gallery, the other to the second, so that the two currents of people going to and coming from these parts of the house are kept entirely separate from one another. This plan of double staircases gives

FROM A PHOTO BY ALEX. A. INGLIS, EDINBURGH.

good acoustic results. The architectural treatment is the same as the rest of the new University buildings, viz., Early Italian Renaissance. The flat side of the semi-circle abuts on the Medical School on the west, while the principal elevation is directly opposite on the east, facing the triangular open space and Bristo Street.

Here is situated the principal entrance, 30ft. in height and 16ft. in width, flanked on each side by double pilasters, and crowned by a semi-circular pediment, containing a marble representation of the ceremony of conferring academic degrees. Besides this there are six other entrances to the Hall from the outside.

The external wall is divided vertically by projecting buttresses containing niches for statuary. It is divided horizontally into three sections. The lower section is panelled and is pierced by the circular windows which light the interior corridor, and the intermediate section

and inner walls of the Hall are 12ft. apart. The space between them is on the ground floor utilised as a corridor. This corridor is divided into compartments by pilasters, and is vaulted; the panels of walls and vaults being filled in with fine red brick. The flooring is of marble mosaic. The corridor runs round the entire auditorium, and gives communication between the various staircases, entrances, and exits.

The entrance to the principal staircase, which is placed in the south angle, is from the quadrangle of the University building. The staircase is oblong in form, and is carried on pillars and arches which are vaulted; its broad shallow steps are guarded by a balustrade of stone. The groined ceiling is decorated in colour, the main features being a series of coats of arms, including those of the Rector, Lord Balfour of Burleigh, and the late Rector, the Right Hon. G. P. B. Robertson, besides those of the already mentioned dignitaries of

much greater facility of entry and exit. From the corridor on the ground floor entry to the Hall is gained by five separate doors.

The dimensions of the hall are spacious, the internal diameter being 106ft., while the height to the dome light is 90ft. This gives an ample floor space, and provides abundant room for the placing of two galleries. The area floor is laid with blocks of oak in patterns, and in order to allow of its being used for other than formal academic functions, the seats on it are of a movable character; only round the circumference are four tiers of fixed fauteuils, also in oak.

The wall is panelled in oak up to the height of the first gallery.

The galleries are placed over the corridor on the ground floor, in the space between the outer and inner walls of the Hall; the inner wall being opened up to the interior of the Hall by means of an arcading of thirteen bays, each

McEWAN HALL. INTERIOR: SHOWING PLATFORM AND ORGAN. FROM A PHOTO. BY ALEX. A. INGLIS, EDINBURGH.

15ft. in width, and rising from the floor to the top of the arch a distance 48ft. upon columns of red Corsehill stone, supported as far as the balustrade of the first gallery by square moulded freestone bases and surmounted by gilded Corinthian capitals.

The pews in the galleries are of oak placed on a sloping platform, and the galleries are guarded by an open balustrade of the same material. These balustrades have central panels, those of the lower gallery being filled with appropriate designs carved and gilded. At the wall head is a carved stone frieze and cornice, above is a coved clerestory, with circular windows 7ft. in diameter, while the whole Hall is covered in with a dome constructed of steel and panelled with wood. In the centre of the dome is a circular light, 22ft. in diameter, which, with the clerestory windows, lights the Hall in the daytime.

The flat side of the Hall, that abutting on the New University Buildings, is reserved for the platform, and the arrangements of it are especially designed for University ceremonies, as the Hall is primarily for academic purposes. At the back of the platform is a series of stalls constructed of solid oak, for the members of the Senatus Academicus, University Court, &c., with special seats in front for Chancellor, Rector, and Principal. As, however, if restricted to its original purposes the Hall would only be used two or three times a year, Mr. McEwan expressed a desire that its uses should be extended, and that it should as much as possible be made available for civic functions, and for concerts of a high class. Following up this idea, a magnificent organ, probably the finest in Scotland, has been placed in the Hall.

Considerable difficulty was experienced in arranging for the placing of the organ in a

Hall which was never intended for one. Two other sections of the organ are placed high up on each side of the platform recess. All these are enclosed in handsome carved oak cases, gilt and coloured, corresponding to the rest of the woodwork of the Hall. A movable orchestra has been constructed capable of accommodating 300 people. The framework is of light steel, the floor and seats being of wood. It is made so as to fit over the stalls on the platform, and can be taken to pieces easily and as easily put together again.

The Hall is lit by electricity. Before arriving at the present arrangements, a long series of experiments were made by the architect and the electric engineers, Messrs. King and Co., as to the best method of lighting the Hall. The result is considered by all who have seen it to be most satisfactory. A large pendant hangs from the dome; above the cornice, but concealed is a series of lights round the whole circumference of the Hall, and these throw a light on the decoration of the dome. The galleries are lighted by placing lamps concealed behind the pillars and the lower beams of the gallery fronts. The result of this concealed disposition of lamps is that the Hall is lighted without the eye being distracted by numerous small brilliant points of light from the lamps.

The complete design for the Hall included a great tower at the north-west angle, rising to a height of 230ft. The lower part of it only has, as yet, been executed; it has been carried up to the height of the roof of the Hall. The great object of the architect in designing the Hall was not to give it the appearance of a Hall intended to hold the maximum number of people in a given space, but to give it as much of a monumental character as possible consistent with the requirements of a good auditorium.

PUBLIC BATHS COMPETITION AT BETHNAL GREEN.

CONSIDERING how frequently we have to complain of unsatisfactory competitions, it is a pleasure to be able to record one which seems to have been carried out in a thoroughly straightforward manner, and in which, undoubtedly, the best design has won. This competition was limited to six invited architects, and Mr. Shoppee was appointed the assessor. Against this system of limited competitions there is much to be said; it is only justifiable when the best men are selected to compete, and in a case of this sort, where some special knowledge is required, they should be men whose sound general knowledge is supplemented by this special knowledge. The majority of the designs submitted in this competition do not impress us as being the work of men of this description.

The first premiated design under motto "Savon," by Mr. R. S. Ayling, fairly earns its position, and seems to score heavily on almost every point. The design is well balanced, no one part being elaborated at the expense of another. This is the only design in which the entrance to the public laundry is placed at the highest point of the site, and the floor kept level with the street at this point, so as to enable the perambulators with heavy linen bundles to be wheeled straight in, without going up steps—a most important point for the convenience of the public. There is also provided space for the storage of these perambulators, which the other competitors have overlooked. His arrangements for economising the service are good. One pay-box commands the entrances for both men and women to the private baths, and in these baths the attendants are so placed that, when there is nothing much going on, one attendant can look after the first and second class in the baths for both sexes. Again, Mr. Ayling is the only one who places the board-room on the ground floor, with the superintendent's office joining it, and a separate entrance, which should prove a very convenient arrangement. The lighting throughout is good, and the design generally shows more grasp of the requirements than do the others. The elevation is simple and pleasing, and is illustrated by a perspective which seems the sort of thing for a competition, giving a correct rendering of the features, and detail for the assessor, with a certain amount of realistic and pictorial effect for the public.

There is rather a mixture of Classic and Gothic in the detail, but that is the fashion. The bay over the side door is rather obviously put in as a "feature," and, perhaps, the whole of the upper part would stand cutting down. On the plan, the chief fault seems to be the wasted space in the corridor connecting the laundry with the baths. Could not this be done away with, and the cross wall taken straight through, and the arrangements of the bath entrances, etc., be pulled together a bit?

"Red Cross," by Mr. Harner, placed second, has contrived to do without corridors, which is a strong point, but he has wasted space on two pay-boxes when one is enough, and waiting-rooms which are hardly necessary in such a neighbourhood. The amount of space occupied by entrances, waiting-rooms, etc., is out of proportion compared with that devoted to the baths themselves. He has, in consequence, to banish his board-room to the first floor, which is not so good as "Savon's" arrangement. This design is illustrated by a quaint drawing, a sort of cross between parallel perspective and isometrical projection, coloured red, and standing in space. This does not do justice to the design, which is simple, and which might look well in execution.

"Simplicity with Utility" is the best of the remainder. The entrance to the private baths is good, but here again too much is made of the waiting-rooms, two of which depend entirely upon borrowed light. The laundry arrangements, perhaps, tell against this design, with their entrance up a flight of steps direct into a waiting-room. The area, too, is not placed sufficiently central for full advantage to be taken of it, either on this floor or the

* A paper read before the Birmingham Architectural Society on Friday, November 26th, 1897.

THE REPAIR OF WALLS.

THE MORE REASONABLE COURSE

would be to cut the stone back until the virgin stone is reached (which, at the outside, would probably not be more than half-an-inch), and then, after having thoroughly wetted the surface, to bring the stone out to the original face with mortar or plaster composed of coarse, sharp, washed sand, and blue lias lime. This method would be found to be far less costly than renewing the stone, and, besides avoiding

BETHNAL GREEN BATHS COMPETITION. FIRST PREMIATED PLAN. BY R. S. AYLING.

unnecessary jarring of the wall, it would protect the stone from further decay and make a better job in every way by avoiding the hard effect of the newly-inserted stone, and at the same time show, as an obviously necessary repair. With regard to fractured ornamental features, everyone knows perfectly well that a mediæval building cannot have come down to our times free from fracture or blemish, and if the work is seen to be complete, a doubt is at once felt as to how much is original. Such imperfections are the honourable scars of time, and our imaginations unconsciously supply their defects far better than any nineteenth century masonry would supply them. If people desire to complete the design of the building, let them rest after they have completed it on paper. The rightness or wrongness of the restoration on paper can be discussed, and the reasons for and against the restoration can be given. But when once the restoration is put in practice the die is cast and the reasons obliterated. One word about Bath stone. Certainly it is cheap, but unfortunately it has the other quality which goes with cheapness. If one were building in Bath and the neighbourhood, it might be reasonable to use Bath stone, for all will agree that an architect should aim at using the material of the district in which he is building. Bath stone finished with a coarse drag is really offensive and expresses incompetence. The drag is a tool which should be abolished, and if the mason cannot use his chisel he should leave the stone as it comes from the saw. Now as to plaster. It is

SELDOM RIGHT TO REMOVE PLASTER

from either the inside or the outside of walls. We know it was the custom of the old builders to plaster their rubble walling, and sometimes they plastered their finest dressed ashlar. Many people do not believe this, but it is a fact, and it can be proved by the existence of plaster on such works. For example, it can be found on the finely-dressed stonework of the ruins of Waverley Abbey and many other places. It is not necessary to remove all old plaster on the walls of a building because some is rotten, or some has fallen, for it can so easily be repaired. The art of plastering is almost lost, and unfortunately the restoration movement has thrown discredit on plaster in a most unreasonable manner. The old method of finishing plaster in one coat must be adopted when repairing old work, and I hope the day will come when the modern three-coat work will be discarded. You can see what you have got with one-coat work, but with the modern method a failure in any of the three coats means a failure of the whole in the long run. Paint has also been discredited, and one of the most beautiful materials we have—viz., whitewash, is thought so badly of that if you wish to use it you must call it distemper. In dealing with an ancient building it should be remembered that any material not made in our own time is generally better suited to the building than the materials now to hand. The old clear glass made 100 years ago is more in harmony with ancient work than any modern glass. Numbers of ancient churches have been spoilt artistically by having the old glass taken out and modern Cathedral glass put in its place. The result is that not only is the outside of the building spoilt, by all the windows appearing to be glazed with bad ice, but the interior is ruined by a horrid green light being thrown over everything. There are many kinds of modern glass which are made in imitation of old, and by the term "Cathedral" glass I wish to include all of them, including those with a sanded surface, and the violet and yellow ones, too. Some architects have a great liking for putting

ORNAMENTAL LEAD WORK

in the windows, but it seems to be a want of modesty to introduce such fancies. One fine old church which I have attended has had elaborate patterns introduced, which I confess are very clever, but the architect, or more likely his clerk, only thought it necessary to draw half of each pattern, so the glazier traced and turned them over, with the result that all the would-be accidental breaking of the bands of glass come exactly in the same place on

each side. The right thing to do when the leadwork of old glazing is decayed is to have new comes put in without taking the glass away from the building. Paving is another most important item, especially in an ancient church. Any existing pavement which is found in an unrestored church will to a certainty be more in harmony with the ancient building than any modern pavement which could be laid. Hardly any paving can be worse than modern encaustic tiles, especially when they are glazed and of many colours. Cast-iron gratings over hot-water pipes are another source of great annoyance, and the more elaborate the pattern the worse they are. There is no reason why old floors should be discarded because they are uneven. They can be taken up and relaid on a good bed of concrete. It is very important that a thick bed of dry rubbish should be put under the concrete, otherwise the cold ground will cause condensation on the pavement. It would be impossible for me even to name all the points which come up when repairing a building, in a short paper, for it would mean writing a lengthy specification. I will, therefore, in conclusion say a few words about roofs. Oak was practically the only material used in England in the middle ages, for the use of chestnut is to my mind a myth. Sapwood of oak nearly always decays—i.e., it is readily attacked by worm. Therefore great care is needed

WHEN EXAMINING ANCIENT OAK

to avoid being deceived by its decay. I have myself used the argument of a gimlet—which I can recommend. Your attention is called to a sadly-decayed timber; you put your gimlet into it, and find that after it has penetrated a certain distance it stops dead, and nothing will induce it to go further. Of course, the heart of oak does decay if exposed to intermittent wet, or if boxed up so that the air cannot get to it freely. My examination of ancient buildings has decided me never to build any timbers into modern work. Timber work can obviously be more easily repaired than any other form of building, for you can not only splice and scarf new timber on to old, but you can with ease strengthen it to almost any extent with iron. Whether mediæval builders were right or wrong in putting on span roofs without tie-beams we need not decide, but we are certainly right in adding tie-beams or tie-rods to every such roof that shows signs of weakness, and also under no circumstances are we justified in putting on an old building any roof which gives a thrust to the walls; in other words, our wall-plates ought always to be coupled either by tie-beams or tie-rods. As to roof coverings, slate seems to be out of the question just as much as corrugated iron is. The day may come when slate will again be used properly, but until that time comes I consider it out of court; in any case slate is inharmonious with an ancient building. It is undesirable to use thatch unless reed thatch can be used, and the more I see of good reed thatch the more highly I think of it as a roof covering. Broseley tiles are almost as bad as slate, but a reaction has set in against them, and hand-made tiles are beginning to come into use again. They are not made quite so well as they used to be, for in order to avoid their twisting in the fire they are given too little heat, and they are apt to be made too thin. We have distinctly made an improvement in our methods of hanging tiles by the use of galvanized iron pegs. Copper nails are apt to prove too weak; but we ought to get aluminium pegs. Had the old builders used them instead of oak pegs many a roof would be as good now as when first hung. The oak pegs decay and break or shrink and drop out. You will understand when I mention slate that I do not wish to include stone tiles, which really make

ONE OF THE FINEST ROOFS IN EXISTENCE.

The stones cannot be too big, for as they increase in size they increase in thickness and raggedness. Provided they are hung with substantial metal pegs and the roof is strong enough to carry them, they can hardly be surpassed for durability. A milled lead roof

is a poor thing. There can be no doubt that the nature of the lead is harmed by milling, but I am strongly inclined to believe that one of the reasons why milled lead is so unsatisfactory is that the metal used is inferior. A practical workman who casts lead in London told me the other day that they had found they could not use old milled lead to re-cast as in many cases it was such inferior metal as to spoil the whole casting. Cast lead, on the other hand, if laid properly (a big "if," I admit), will last almost for ever. The roof which has recently been laid on the nave of Winchester Cathedral is such a roof. The points to observe are that the sheets should be small, that they should be thoroughly secured without binding the lead, so as to tear by expansion and contraction. There is a great art in casting lead, and this at Winchester was exceptionally well cast. There is also, of course, the copper roof and the asphalt flat roof, which, in my opinion, if laid properly on thick concrete, is the most durable roof the world has ever seen. Having taken the main points in a building, any one of which would, of course, be sufficient to form the subject of a paper, let me say a few words with regard to those who first started the restoration movement. Until the experiment had been tried and thought out in all its bearings, those who practiced it could not be blamed. At the same time its evil results might have been seen and recognised sooner than they were. Every artist condemns a restored building; every historian that goes to buildings for his facts condemns restoration. It falsifies history, it debases Art.

NEW HOTEL FOR HARROGATE.

A SCHEME has been propounded with the twofold object of providing Harrogate with a first-class palatial hotel, and of opening up the Spring Bank Estate. A small syndicate, headed by Mr. J. J. Bell, of Harrogate, formerly of Newcastle, have purchased from the trustees of the late Messrs. Carter, for £20,000, an area of nine acres of land which adjoins the Spa Estate (now the property of the Harrogate Corporation), and located between Ripon Road, Spring Bank Avenue, and Alexandra Park, as the site for the Palace Hotel. The hotel is to be erected upon the most improved principles, and fitted up with all the best and latest necessities and requirements; it will have 300 bedrooms. The area set apart for the building and the grounds will be nearly seven acres, and the elevation of the hotel will be to Ripon Road, Spring Bank Avenue, and the Spa grounds, with the principal façade in the direction of the new Royal Baths. The main entrance will be directly opposite Swan Lane, but a short cut will be available, with an outlet at the lower corner of the estate, close to the old skating rink, and opposite the George Hotel, where an entrance lodge will be erected. This arrangement will give a nearer approach to the town. The present Spring Bank House will, in course of time, be demolished, and a number of villas, in the Early English style of Architecture, will be erected on the higher portion of the estate, to face Ripon Road and Spring Bank Avenue. The work of erecting this large establishment is to be commenced in the early spring, but already the surveying of the land has been taken in hand, and London architects will be invited to send in competitive designs. In addition to the large number of bedrooms mentioned above, and the usual dining and other rooms, special features will be the ball, recreation, and reception rooms, a large hall, lounge, and winter garden, library, suites of private rooms, with baths and lavatories, suites of invalid rooms, with servants' rooms, &c., with special attention to ventilation, lighting, telephones, &c.

BETWEEN thirty and forty Romano-British bowls, dishes, cups, jugs, and platters, of pewter, with incised ornaments, have been discovered at Appleshaw, near Andover, on the supposed site of a Roman villa.

R.I.B.A.

A FESTIVE CELEBRATION.

A FESTIVAL dinner, in commemoration of the sixtieth anniversary of Her Majesty's accession and the incorporation of the Institute, was given on Thursday evening at the Hotel Metropole by the Royal Institute of British Architects. The president, Professor G. Aitchison, A.R.A., was in the chair, and amongst the

Gilbert, R.A., Professor Corfield, Mr. Rudolf Wicks, and Sir G. Hayter Chubb.—The President, in proposing the loyal toasts, mentioned that the Royal Institute of British Architects owed a peculiar debt of gratitude to Her Majesty, for it had been made the chooser of

THE GREAT ARCHITECT OF THE DAY

of any country on whom Her Majesty bestowed her gold medal.—The Bishop of London, responding for the House of Lords, claimed

House of Lords afforded a graceful way of doing it, and in that way it had a distinguished function to discharge in the Constitution. What the House of Lords aspired to do was by its independent position to render its advice on measures inaugurated in the House of Commons. So long as it did that, with the gravity and wisdom and consideration and attention to business which characterised its proceedings, it deserved, and he thought received, the approbation of the English

St DAVIDS CHURCH EXETER

DESIGN PLACED SECOND IN COMPETITION

Harbottle Reed Architect Exeter.

company, numbering about 180, present were the Lord Mayor, the Bishop of London, Dr. Collins (chairman of the London County Council), Sir E. J. Poynter, Mr. W. Ellison Macartney, M.P., Mr. Hugh C. Smith (Governor of the Bank of England), Sir H. Howorth, M.P., Mr. J. Macvicar Anderson (vice-president), Sir J. Wolfe-Barry, Mr. Ernest George, Sir W. MacCormack (President of the Royal College of Surgeons), Mr. W. Godden (President of the Incorporated Law Society), Mr. Bousfield, Q.C., M.P., Sir W. B. Richmond, R.A., Mr. A.

that that institution had a remarkable educational influence upon its members. A man in the House of Lords felt if he had nothing to say, he had much better say it. Besides the educational effect it had upon its members, the House of Lords had a distinguished place in the Constitution. It was inevitable in party government that sometimes a party should commit itself unwittingly, to a programme which it was not able to carry out, and yet when once a party had raised a cry it was exceedingly difficult for it to drop it. The

people.—Mr. Macartney, M.P., responded for the House of Commons.—Mr. Aston Webb gave the toast of "The Lord Mayor and Municipal Corporations," and the Lord Mayor, acknowledging the toast, said he was always ready to join the hand of friendship with the County Council. The City's was an ancient corporation, and they should be glad when the County Council became a similar institution. But it must take time, and that time had far better be occupied by attending to the business of the County of London than by

attempting to destroy the old City of London. A great calamity had overtaken the City of London, and it was important to the citizens of London, as well as to the Profession of Architects, that something should be done in order that such catastrophes should not occur in the future with so much ease as in the recent instance. He hoped before many days were over that the Corporation would be able to make some suggestions, but, for his own part, as head of the Corporation, if any one connected with the Institute could give him any suggestions which he could lay before the Corporation he should accept them and submit them to the Corporation with the greatest amount of pleasure.—The President, in a graceful speech, proposed "Art, Literature, and Science," coupling with it the names of Sir E. Poynter, Sir E. Maunde Thompson, and Sir J. Wolfe Barry.—Sir E. J. Poynter, P.R.A., replied for Art.—Sir E. Maunde Thompson, speaking on behalf of Literature, observed that it was one of those subjects which, in these days, ought to be responded to by a syndicate. It was a question whether literature was not at present too healthy, and whether she would not be the better for being placed on a lower diet. He had a wider acquaintance with the outside of books than with the inside, and he could almost weep to see much of the best literature of the forties and the thirties all lying on the shelves of the British Museum, and no one referring to them. His only consolation was that the paper was so abominably bad that the final dissolution must soon come to save posterity from a monstrous amount of literature. There was this consolation at the present time, that though there was this great mass of literature they were not bound to read it. In fact, his experience was that each one of them was so

BUSY WRITING HIS OWN BOOK

that he did not dream of reading anybody else's. It was the age of one man one book.—Sir J. Wolfe Barry said an application of Science which called for very great attention in this great City was that which had been alluded to by the Lord Mayor, in trying to make the great congested mass of houses in the City less susceptible to the ravages of fire. It had been his business to visit the scene of the great fire, and one could not help being struck by the fact that there must be some great fault in the construction of modern buildings that they should fall down and be destroyed in a few hours from a fire which, he supposed, if attacked in the first half-hour of its origin would have had no great danger to the surrounding houses. Art had much to learn from science, but science had something to learn from Art, and for himself he could not see why things which were useful and served a distinct utilitarian purpose should necessarily be ugly. Engineers might with great advantage study some of those great principles of beauty with which the architect's profession was more particularly concerned.—Dr. Collins, Chairman of the London County Council, proposed "The Royal Institute of British Architects and allied Societies," and took occasion to express some surprise that architectural science had not received greater recognition in the Universities. Architecture, as a German philosopher had phrased it, was "frozen music"—harmony crystallised into form. He hoped it was not too much to dream of a municipal school of Architecture in London.—The President suitably replied, and this brought the speeches to a close.

A PROPOSAL is on foot to erect a memorial in Godalming to James Inskipp, whose paintings contain many Surrey scenes. Inskipp lived for several years in a cottage in the Cotteshall Lane, Godalming, and it has been suggested that a memorial tablet should be placed outside.

WE are informed that the firm of George Farmiloe and Sons, of 34, St. John Street, West Smithfield, E.C., has for family reasons been registered as a limited company, under the style of "George Farmiloe and Sons, Limited." The management continues the same as heretofore.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 8th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

MR. TATE has given instructions to the builders (Messrs. Higgs and Hill) to at once proceed with the work of completing the Gallery of British Art according to the original design of his architect, Mr. Sidney Smith. This work, which will occupy about eighteen months, will considerably more than double the size of the existing building, and give

PAIGNTON CHURCH, DEVON. FONT BEFORE RESTORATION, 1897.

much more space for picture-hanging, in addition to which two large rooms will be devoted to sculpture.

It is not only in theatres and other places of public entertainment that precautions against fire and panic are not always all they should be. Some of our churches are almost as great offenders, as was seen the other day when the accidental bursting of a steam-pipe, combined with fastened doors, came near to causing a serious panic. Now a correspondent draws attention to the case of a Congregational church in London, at which the most reckless disregard is shown for the safety of its frequenters in the event of fire or panic. The preacher is popular, so every seat is commonly filled, and when this is the case late-comers are accommodated with seats down the aisle, which is packed with chairs for their use. As our correspondent says, "In case of panic, could any instrument of torture be more effectual than chairs, for not only blocking the way, but for breaking necks, backs, and limbs, or for giving the victims a surer 'happy despatch'?" It is all very well to preach to people to keep cool and sit still under these circumstances, but neither preacher nor officials, nor congregation would be likely to act on the advice." Theatres and music-halls have been compelled by the County Council to put their houses in order, and not before it was time; perhaps the Council might advantageously turn its attention to the churches.

A REMARKABLE and rather startling statement is made by Canon Scott Holland in a Church contemporary. In discussing the building of St. Paul's Cathedral, he says:

"Wren took enormous trouble to knock down the old building and lay the foundations afresh. He said he was building for eternity, and went down 60ft. at a dangerous corner before he could reach the ground that satisfied him. He also placed the foundations at another angle of the building from the old, in order that he might get them dug afresh, and was always afraid lest the drainage of water might shift the gravel. Hence our terror of electric railway stations." Canon Scott Holland adds:—"The building has moved slightly, and is moving still. Some settlements must have occurred very early, leaving cracks that have to be watched. Wren was a superb builder and engineer, but he introduced an immense mass of iron clamps to hold the stones together, which has proved a frightful difficulty. It rots the stone. For years we have been compelled to remove it, and we have more work ahead of this kind."

At last the County Council is moving to secure the much-needed improvement in Southampton Row. A wide thoroughfare from the Strand to Holborn is really wanted, and has long been talked of; but any improvement is better than none, and in the meantime the plans of the Council seem to provide for great relief of the traffic even without a continuation of a widened thoroughfare to the Strand. Not only is the Improvement Committee authorised to acquire the property between Southampton Row and Kingsgate Street for the widening of the former road; but it is empowered also to acquire a block of property at the south-west corner of the Row. This points to the probable construction of a semi-circular opening of the greatly widened street, so that the traffic from the north may turn freely eastward into Holborn, or westward towards Oxford Street, without aggravating the present block at the crossing to and from Little Queen Street. This relief alone would justify the acquisition of the property at a favourable moment before the new leases are negotiated with the present tenants. But the larger scheme of a continued thoroughfare to the Strand ought not to be delayed. Such a thoroughfare is one of the pressing needs of London.

THE ancient parish Church of All Saints, Dovercourt, situated in the picturesque seaside suburb of Harwich, is now under restoration. It is a very ancient structure, having been granted by Alberic or Aubrey de Vere (Lord Chamberlain to His Majesty) to the Abbey of Colne in the time of William the Conqueror. This grant was afterwards confirmed by Henry I. in the year 1111. Until recently, on account of the modern battened-out walls and flat ceiling, the church has presented an "unadorned and barn-like appearance"; but as it was found absolutely necessary to re-tile the roof and repair the walls, it was very wisely decided to endeavour to restore the church to somewhat of its original character by removing the battened walls (erected in 1811) and opening up the roof, so as to show again the handsome carved oak "collar" beams and rafters which were known to be hidden up. In doing this work it has been discovered that the walls of the nave were originally "frescoed" all over, apparently at a very early age, for the frescoes are covered with a layer of plaster, upon which texts and the Lord's Prayer are written in the old black letter writing of the fourteenth or fifteenth century. The age when this was done is clearly defined by the device of a Royal cap with crossed feathers and the name of King Henry IV. over the principal doorway. This letter writing is again covered with more lettering of more recent date, and this again was obliterated by being whitewashed over, as, indeed, was the whole church, including the fine oak rafters and beams. It is feared that the frescoes and old lettering are both too far gone to restore, but every effort is being made to preserve, if possible, this evidence of the work of centuries ago.

ANOTHER interesting feature of the restoration of Dovercourt Church is the unveiling of the old spiral staircase built in the north walls of the nave and leading to the rood

which, in its day, was a very famous one, whose supposed "sanctity drew from far and near unto it many votaries and devoted pilgrims with their offerings" (see Dale's "History and Antiquities of Harwich and Dovercourt," published in 1732). This rood, was stolen from the church in 1532 and burnt on Dovercourt Green, the miscreants afterwards being put to death for their sacrilege. There has been disclosed, too, an ancient piscina in the south wall of the nave, evidently used in connection with a side altar placed immediately outside the screen. There is also to be seen within the church one of the original poor-boxes with the date on it (1589); also a Norman font not long ago taken from an adjoining farmyard, where it was used as a drinking-trough for cattle.

In connection with the appeal for funds towards the restoration of the Dovercourt Church, Mr. Thackeray Turner (Secretary of the Society for the Protection of Ancient Buildings) writes:—"My committee desires that you will allow it to ask all contributors to the funds to urge the importance of not replacing the old hand-made tiles on the roof by modern machine-made tiles. The Committee's reason for making this request is that new machine-made tiles are not as durable as hand-made tiles, which have proved themselves capable of withstanding the weather, and, of course, everyone knows that the hand-made tiles are by far the most beautiful, and certainly more in harmony with an ancient building."

In response to a representation made by about 70 of the beneficed clergy of London, the Cowley Fathers have arranged to open a branch house of the Society of St. John the Evangelist, in Westminster. The site purchased is on the west side of Dartmouth Street, Westminster, close to that on which new offices, the property of the Universities' Mission in Central Africa, have lately been erected, and is occupied by four houses. These it is proposed to demolish, substituting a building designed by Mr. Henry Wilson, of Gray's Inn Square, and estimated to cost about £9000, exclusive of furniture and church fittings. Of this, the main portion will comprise accommodation for a few resident members of the Society, with cells for receiving about 25 visitors, lay or clerical, during retreats, a small private chapel, refectory, library, visitors' room, waiting-rooms, and all necessary offices. Across the rear of the whole will be placed a chapel, having separate access from the outside, and seating about 140 persons, to be used for retreats, meditations, instructions, lectures, and other special purposes of the mission.

The new American National Gallery is one of the finest buildings which adorn the city of Washington. Externally the structure is of a noble and imposing character, and the site selected is one which enables the grand proportions of the edifice to be fully appreciated. The grand staircase, rising from the entrance hall, is designed on magnificent lines, and the building throughout will, when completed, be a worthy repository of the priceless treasures to be deposited within its walls. The public reading-room is, so far as its architectural arrangements are concerned, modelled on much the same principle as the reading-room of the British Museum, but the readers' desks, instead of radiating from the centre, are arranged around the librarian's office in a circular fashion. This plan seems, at first sight, hardly as convenient as that adopted at our museum. The Washington library has, however, much more space at command, and therefore the economy of a few square yards of floor area is a matter of little or no moment. The decoration of the interior walls will occupy some considerable time, but in the meantime the work of removing the National Library from the Capitol to the new building is going on incessantly, and it will be another month or so before the last of the books is safely shelved in its new home. The new building, which covers three acres of ground, is estimated to cost six million dollars, but this sum

will, no doubt, be largely exceeded by the time all the decorative work is completed.

THAT extraordinary shrine, the grotto of Lourdes, is to be reproduced in the Church of Our Lady of Lourdes, in Brooklyn, which is now being rebuilt at a cost of over £40,000. The original is to be reproduced in every detail, both as to proportions and arrangements. There will be huge rocks surrounding the grotto, and in a deeper recess will be a life-size statue of Our Lady of Lourdes. Inside the grotto will be a small altar, a fac-simile of the original, while even the surface of the rocks will be artificially blackened to represent the smoke from the countless candles offered by pious pilgrims. The grotto will rest above the graves of the priests who have served the parish and died, the church having been built immediately above the tombs in which their bodies have been laid.

In the House of Lords the appeal of the Vestry of St. Matthew, Bethnal Green, against the School Board for London was heard. This was an appeal from an order of the Court of Appeal affirming an order of the Queen's Bench Division directing a writ of *mandamus* to issue directed to the vestry of the parish of St. Matthew, Bethnal Green, commanding it to maintain and from time to time to repair a certain conduit for drainage which passes through land purchased by the School Board for London. The facts of the case were these. In July, 1894, the School Board for London acquired the freehold of certain lands situated in the appellants' parish, which included a street known as Tyrrell Street, in which were certain houses. Previously to 1866 these houses had no drains, but in that year a line of pipes was laid by the then owner of the houses to carry the sewage to the sewer belonging to the appellants. No evidence was forthcoming of any notice in writing having

been given by the owner of the houses of his intention to lay the line of pipes, or of any order of the vestry in relation thereto having been made. In the Queen's Bench Division and in the Court of Appeal it was found as facts that the vestry knew and did not disapprove of the connection of the line of pipes with the sewer vested in the vestry. The question raised was whether in these circumstances the line of pipes constituted a drain which the respondents would have to repair, or whether it was a sewer which the appellants were bound to repair. The Queen's Bench Division held that the line of pipes constituted a sewer, and issued a *mandamus* commanding the vestry to repair it, and their decision was affirmed by the Court of Appeal. The vestry appealed, but the appeal was dismissed.

THE doorway illustrated on this page is situated in the inner courtyard of the fine old Warwickshire house of "Compton Winyates," one of the seats of Earl Compton. The house was erected in the seventeenth century, and contains many interesting features and much very good detail.

THE new lighthouse at Penmarch, on the Breton coast, erected as a monument to Marshal Davoust, is now completed. The funds were provided by the Marshal's daughter, the Marquise de Bloqueville, who left a sum of 300,000 francs to erect and provide for the maintenance of a lighthouse as a memorial of her father. She desired that the tower should be known as "The Eckmuhl Lighthouse"—the Marshal having been created Duke of Eckmuhl by Napoleon I. This idea of erecting a lighthouse as a monument of a great man might be appropriately copied in the case of our famous sailors or discoverers, for whom a lighthouse looking out over the waves from some bold headland would be a more fitting, and at the same time a more useful,

memorial than a soot-begrimed statue in a city square or street.

No sooner has the work of destroying the old Bell Hotel, at Bromley, in Kent, been proceeded with (writes an artist correspondent) than the fate of another picturesque hostelry in the neighbourhood has been decided on. This is the Crown at Plaistow—a diminutive inn which is said to have been erected no fewer than four hundred years ago, and which will cease to exist when the new building, now in course of construction, is completed. There is little of interest about the place beyond its great age, but it gives a very good idea of the sort of inn our forefathers had to be content with. Sundridge Park, too, is quite close, and here is the curious rock-like collection of oyster shells which geologists have found so difficult to account for.

THE Yerkes Observatory is more symmetrical than most buildings of a like nature. It has the form of a Latin cross, the great dome is at the western extremity of the longer axis, and there are two smaller domes at the northern and southern ends of the arms. The great dome has a rising and falling floor, a necessary feature when working with a telescope of sixty-two feet focal length.

MR. MARK H. JUDGE, A.R.I.B.A., Fellow of the Sanitary Institute, writes: "Had I not read it above his name in the Times, I would not have believed that Sir Arthur Arnold would have made himself responsible for the statement 'that the [London County] Council has no more to do with the house drainage of Kensington than with that of Birmingham.' Section 39 of the Public Health (London) Act, 1891, provides that 'The County Council shall make bye-laws with respect to water-closets, earth-closets, privies, ashpits, cesspools, and receptacles for dung, and the proper accessories thereof in connection with buildings, whether constructed before or after the passing of this Act.' 'It shall be the duty of every sanitary authority (of which the Kensington Vestry is one) to observe and enforce the bye-laws,' and 'the County Council, on it being proved to their satisfaction that any sanitary authority have made default in doing their duty under this Act . . . may institute any proceedings and do any act which the authority might have instituted or done for that purpose.' The powers thus given to the London County Council do not extend to Birmingham."

Apropos of the great masonic service by which the 200th anniversary of the re-opening of St. Paul's Cathedral was celebrated on Thursday last, it may not be generally known (says a correspondent) that the famous hostelry in the churchyard where the Lodge of Antiquities, of which Sir Christopher Wren was Master, used to meet, was none other than the "Goose and Gridiron," which was demolished not long since. This old-world tavern, which was supposed to occupy the site of the still more celebrated "Mitre," which was the first music-house in London, stood in London House Yard, where, during the building of the Cathedral, Sir Christopher and his masonic brethren were wont to assemble. To this Lodge the distinguished architect presented the mallet and trowel which was used in laying the foundation stone of the mighty edifice in 1675.

DURING the course of some excavations near the Great Turnstile, Holborn, for the purpose of laying telephone wires, some workmen employed by the National Telephone Company made an interesting discovery about 5ft. below the surface, and brought to light what first appeared to be trunks of trees, which had evidently been lying beneath the ground for a great number of years. Upon being closer inspected it was found that the trees were bored through, and, according to experts, these had been used in connection with the water supply before the introduction of iron tubing early in the last century.

THE Improvements Committee of the London County Council have submitted to the Council

a specification of lands upon which it is proposed to place an improvement charge in connection with the widening of the Strand at Holywell Street. The committee state that in compliance with the undertaking recently given by their chairman they had considered the desirability of recommending the Council to forgo "betterment" as already authorised by Parliament, and to seek Parliamentary powers for the acquisition of the freehold and long leasehold interests in the property to the north of Holywell Street with a view to recoupment, the other interests in the property being allowed to run out, Wych Street being widened, and the new northern frontage of the Strand being brought down in front of the present northern frontage of Holywell Street. They have had a plan prepared showing the effect of widening Wych Street to 40ft., and the Strand to 100ft. between the two churches. It did not appear to them, however, that it would be wise to bring the new northern frontage to the Strand down lower than the present northern frontage of Holywell Street, having regard to the fact that it had not been decided either to set back the Strand on the northern side of St. Mary's Church or to remove the church. Moreover, it was very doubtful whether Parliament, merely to save expense to the Council, would authorise the acquisition of the freehold and long leasehold interests as suggested. The only other result of the alteration would be the widening of Wych Street between St. Clement's Dane's Church and Newcastle Street. They had been unable to separate the freehold and long leasehold interests from those of trade occupiers, as it was not practicable to obtain particulars with respect to the length of the leases. In some cases the freeholders occupied the premises for business purposes. They were advised that in that instance it was not probable that any large sum would be saved by allowing the short leases to run out. From estimates which had been prepared it appeared that the net cost of the altered scheme, upon the ordinary basis of calculation adopted in connection with improvements authorised by Parliament, would be, after allowing for recoupment, about £15,000 in excess of the estimate of the cost of widening the Strand as already sanctioned by Parliament, including the levying of an improvement charge. In addition to the increased cost, it should be remembered that the necessary compulsory powers which would be required, if the altered scheme were adopted, could not be obtained before the autumn of 1899, it being now too late to take any steps with a view to an application in the next session of Parliament. After full consideration of all the facts, they were of opinion that it would be highly undesirable that the Council's power of imposing an improvement charge, as already authorised by the Improvements Act 1897, should be abandoned, and they had accordingly resolved to advise the Council to affix its seal to the improvement charge specification. The Council's seal was accordingly affixed.

THERE is on exhibition in the Egyptian Department of the British Museum, the lower portion of what was, doubtless, once one of the finest statues of later Egyptian Art. The statue represents a person kneeling, holding in front a sistrum ornamented with the head of the goddess Athor, a deity largely worshipped at Denderah, where the remains of a large temple, dedicated to her by Caesar Autocrator, are still to be seen. The person represented appears to have been a priest, judging from the remains of a long robe which is to be seen on one side. The base and sides are ornamented with hieroglyphics containing a prayer to Athor and Isis. The statue is made of granite, which stone was often used by the Egyptian artists of about the third and fourth century before our era. This object belongs to the class known as funeral statues, and are mostly found in the ante-chambers of the tombs at Thebes and elsewhere.

AT Torre Annunziata, the village abutting on the site of Pompeii, an ancient mosaic has been discovered in good preservation; repre-

senting a man holding a scroll, and discoursing to four seated figures, one holding a globe, another with his chin supported by his hands in an attitude of deep thought. A pillar, on which is a sundial, stands in the background, and behind are the roofs of a city, above which rises an acropolis, which possibly may be intended for Athens. The teacher's head is bald, and the scene is undoubtedly laid in a school of philosophy.

THERE was a tremendous gathering of the brethren at St. Paul's Cathedral on the 2nd inst., on the occasion of a special masonic service to celebrate the bi-centenary of the re-opening of the Cathedral. One of the processional hymns was Dr. J. M. Neale's famous "Blessed City, Heavenly Salem," sung to a Gregorian tune, the third verse of which has a peculiarly architectural ring:—

"Many a blow and biting sculpture
Polished well those stones elect,
In their places now compacted
By the Heavenly Architect."

St. Paul's Cathedral cost in the building exactly £747,954 2s. 9d. This sum was raised partly by private subscription, the King setting aside a large sum to be paid out of his private purse. It is slightly doubtful, however, if he ever paid it. The remainder of the amount was raised by a duty on coals. There have been three erections, and the present one has been so far the most fortunate. Both its predecessors were burnt, not once but many times. Letters patent for the rebuilding of the present Cathedral were issued in 1673, and Christopher Wren himself laid the foundation-stone on June 21st, 1679. The Cathedral was finally completed in 1710.

THE thirtieth annual prize distribution of the North London and Borough of Hackney School of Art took place on the 3rd inst., Prebendary Shelford presiding. The annual report, read by the hon. secretary, Mr. C. C. Paine, stated that the efficiency of the institution was fully proved by the excellent results gained at the examinations—both those of the Department of Science and Art and of the London County Council. In the Government examination 76 per cent. were successful, with 36 per cent. first class, while the numbers successful for the whole of the kingdom were only 64 per cent., with 29 per cent. first class. In the London County Council's examination nine scholarships were gained. The prizes were distributed by Mr. Onslow Ford, R.A.

THE report of the committee appointed by the Board of Trade to inquire into the system of ventilation of tunnels on the Metropolitan Railway has been issued. The committee state that by far the most satisfactory mode of dealing with the matter would be by the adoption of electric traction. The committee consider the ventilation of the tunnels by means of fans would be practicable, but state that in view of the probable adoption of electric traction in the near future it can hardly be expected that the Company will incur the expense of at once providing artificial ventilation, and that if they did it would probably deter the more satisfactory solution of the question.

THE first sod of the South Wales Direct Railway has been cut. The new line, which is being built by Sir Weetman Pearson for the Great Western Railway Company, will be 33½ miles long, from Wootton Bassett to Patchway, including Filton loop and the junction loop with the Midland Railway near Yate. By means of it the distance by rail from London to Newport (Monmouthshire) will be reduced to 132 miles, as compared with 143 miles via Bath and Bristol, and 158 miles via Gloucester. The construction will involve the making of three tunnels; the first, through the Cotswold between Acton Turville and Chipping Sodbury, being two and a half miles long; the second near Alderton, quarter of a mile; and the third, near Wootton Bassett, an eighth of a mile. Four viaducts and about 100 bridges will be constructed, and there will be seven stations.

THE PLANNING OF HIGH SCHOOLS FOR GIRLS.

By J. OSBORNE SMITH, F.R.I.B.A.

DURING the past twenty-five years a goodly number of high schools have been established, and for a lesser number special buildings have been erected. The requirements have naturally grown, and experience has, as usual, taught many valuable lessons to all concerned. High schools, I may remind you, are superior day schools for girls of all classes above those provided for by the elementary schools. There were no high schools twenty-five years ago: the word "high" was not applied to schools until the incorporation of the Girls' Public Day School Company Limited, in June, 1872. The starting of this Company to establish and maintain in London and the provinces superior day schools forms an epoch in the education of the larger half of the inhabitants of England. It was an attempt to meet and correct the defects pointed out in the report of the Schools' Inquiry Commission, which were "Want of thoroughness and foundation; want of system; slovenliness and showy superficiality; inattention to rudiments; undue time given to accomplishments—and these not taught intelligently or in any scientific manner; want of organisation." The first high school was opened in January, 1873, at Chelsea, in an old house adapted for the purpose. There are now thirty-four schools belonging to this Company, and various others have been established by limited liability companies, which were formed usually to establish individual schools.

EXISTING BUILDINGS,

more or less adapted for the purpose, formed the first homes of many flourishing schools now housed in buildings, the planning of which is based upon the knowledge thus gained. Work carried on in buildings originally erected as private residences, or for other purposes, revealed almost hourly weak places where time was lost, where adequate supervision was impossible, and where it was hopeless to combat the evils attendant upon temporary and ineffective means of ventilation, low and small rooms, narrow staircases, weak floors, falling ceilings, small and dark cloak-rooms, small fireplaces, insufficient light, and numerous other defects. These drawbacks to effective teaching were well remembered, discussed, and digested whenever a new home was in view, and the new school-house, planned and erected for a definite purpose, became at once an added pleasure to the daily lives of both mistresses and pupils, and an effective aid to education. It is difficult to find existing buildings suitable for high schools, or that can be made efficient without great expenditure; this sometimes leads to two or more houses (not necessarily adjoining) being occupied by one school—a most trying arrangement for the teaching staff. To follow in detail the growth and development of these schools in the

ADAPTED BUILDINGS

would make an interesting paper by itself. I propose to dwell upon the types of plans which experience has proved to be best suited for the work which is carried on in high schools. One of the most prominent characteristics of a high school should be cheerfulness—produced by ample lighting, plenty of sky visible, possibility of the sun himself being able to peep into every room, pleasing wall surfaces, good pictures, &c. All these, except perhaps the last, form a part of the design, and if the architect will make tempting provision for hanging pictures in suitable positions, the pictures will soon follow. Gloom, semi-darkness, and all the opposites to bright airiness should find no place where children are being taught. Spaciousness, too, is an important quality to secure; ample floor space is here meant—not loftiness. Class-rooms need not be lofty to be healthy; an excessive cubic space above the pupil's heads makes ventilation and warming more difficult, and is simply inclosed space in the wrong place. It is obvious, also, that inasmuch as it is found

desirable to limit the number of children in a class in these schools to thirty or forty, the floor space must be limited to dimensions which will enable the mistress to keep the pupils well under control, to speak to them all effectively without strain, and have access to each desk without disturbing the pupils at adjoining desks. These considerations, as well as those of access to the room, space for and around the mistress's desk for teaching apparatus, &c., must be regarded as determining the extent of floor space, even when it is not urgently necessary to keep always in mind the cost of every cubic foot of space you may wish to inclose. When the room is warmed by the usual open fireplace, the best position for that cheerful, if wasteful, contrivance must not be overlooked, because it also demands a portion of the available floor space. The relative

POSITIONS OF THE DOOR AND FIREPLACE

in relation to the windows deserve more consideration than is usually given. Waste of space necessarily arises where both door and fireplace are not situated at the end of the class-room occupied by the teacher. It is not convenient for the fireplace to be in the centre of the end wall; sometimes it may be well placed near the door. The corner of the room on the right hand of the teacher is a position with many advantages. The fireplace should contain some form of ventilating or warm air producing grate, with fresh air brought to it from outside well above the ground, all inlets being short, and accessible for cleaning; the air chamber for warming the incoming air ought also, for cleanliness' sake, to be readily accessible. In large rooms, or where there are two or more external walls, it is sometimes found desirable to supplement the fire by hot-water pipes under the windows, or along the wall opposite to the mistress. Open fireplaces should not be omitted from schools of this kind without very full and serious consideration of the means to be employed to warm and ventilate the buildings, and especially the class-rooms. In a form of class-room for thirty pupils, which from its frequent use may be accepted as convenient both in shape and size, the allowance of floor space per pupil is 13ft. 6in. super (or 13'65ft., to be quite accurate), and the cubic space 163'8 cubic feet per child. Space should be provided

BETWEEN THE WALLS AND DESKS

for access for supervision, and to enable the children and mistress to write or draw upon the slates or blackboards upon the walls. Movable blackboards are inconvenient appliances, but, as they are less costly than continuous slates, the inconvenience still prevails in too many instances. It is possible still to find class-rooms with windows, blackboards, and desks so arranged that it is impossible for all the scholars to read what has been written or drawn for their instruction. The ceilings should be as much as possible unobstructed by beams or other timbers which prevent the ready flow of air or check or divert the air currents. A point which affects the health and comfort of teachers is the provision of windows at the back of the children. If these windows happen to be in a south wall,

THE EVIL BECOMES VERY TRYING.

A teacher told me a few months ago that one of his eyes was seriously injured from having to face a south window; moreover, under such conditions some of the pupils' features are in shade, and it is not possible to distinguish the effect of the teacher's remarks upon the children, which is so very desirable, and adds to the interest and pleasure of teaching. Except in cases of special difficulty, it is possible to effectively light any class-room, large or small, from windows in one wall only. An additional window may be useful for obtaining direct sunlight in an otherwise sunless room, or for securing cross ventilation not otherwise obtainable, or for other sufficient reasons, but it will in any case be found desirable to make that window smaller than the rest, or to place it in a corner of the room, or to arrange means of regulating the light from

it when required. The chief use of the assembly room or central hall is to accommodate all the pupils at one time daily, and its size is fixed accordingly. If the school is thought likely soon to expand beyond a nominal standard this room may be built to accommodate a maximum number of possible pupils; in other cases, where a smaller number of pupils are provided for, with no reasonable prospect of extension, the assembly room may be of lesser dimensions. As will be noted further on, this hall may serve for access to the class-rooms upon two floors, a consideration by which its height is often determined. Naturally, the supplementary purposes for which it is used also affect the floor space, shape and dimensions. This important room should be near the principal entrance, and have ample means for access; it was a common defect in the earlier schools that only one entrance was arranged. This should be regarded as inadmissible, except in very small schools. The position of this room in relation to the class-rooms is probably the most important factor in determining the

GENERAL PLAN OF A SCHOOL.

Side-lighting for this hall is preferable for the sake of ventilation. Where top-lighting is used, great care and judgment are required to avoid too much glass, which, moreover, should be placed as near the sides as possible, in order to prevent deep shadows being cast upon the floor from the balconies. Centre top lights are rarely successful for school-rooms of any kind. Good acoustic conditions ought to be secured for this room. For convenience of consideration, plans may be divided into three types, viz.:—1. Those which have the principal class-rooms and the assembly-room separated by corridors, as in this slide. 2. Those where the class-rooms are grouped round a central hall. 3. Those which have class-rooms on one, two, or three sides of the assembly-room, leaving the fourth side an external wall. The difficulties of a contracted or otherwise comparatively unsuitable site—while increasing the architect's interest and enjoyment of his work—often lead to varieties of treatment not included in either of these types. These may be regarded, however, as exceptional plans adapted to special situations rather than

TYPICAL EXAMPLES.

Sometimes a feeder is fostered in the form of a kindergarten room, which should be exceptionally cheerful, on the sunny side of the ground floor, near to the pupils' entrance, and to separate lavatories. A spacious room for drawing purposes facing north or east, with as much floor space as can be afforded, and wide doorway, fitted with cupboards, rails, and shelves for models, racks for boards, drawers for paper drawings and materials, a sink, dark blinds, &c., well lighted from one side or end. Usually the best situation for this room is upon the top floor. Laboratories for teaching chemistry and physics (separate rooms for each, if possible), with impervious floors, ample side or top lighting, and special means for ventilation, fitted with working tables, with water, gas, and electricity laid on. Also a small room for balances, cupboards for stores, apparatus, &c. The size of the laboratory must depend upon the extent to which science is taught in the school. It should be lofty, well lighted, with the windows just above table height, and extending to the ceiling; ventilation must be specially studied, particularly the means of readily producing cross currents of air at the levels of the work-tables and ceiling. It is convenient sometimes to plan a

SEPARATE BUILDING FOR SCIENCE TEACHING.

A covered playground fitted as a gymnasium. A luncheon-room for mistresses and pupils, with the kitchen and offices and housekeeper's rooms adjoining. These domestic rooms should be planned with a separate entrance, and be cut off from the school-rooms, with prompt access from the kitchen to all the school entrances, and from the school to the dining-room. On no account should any of the noise or odours from the domestic rooms be allowed to enter

the school proper. Well-lighted and ventilated cloak-rooms, not less than 9ft. high, and large enough to afford floor space for fittings. The best positions for cloak-rooms is, of course, near the pupils' entrance; stands for cloaks should be about 6ft. apart from centre to centre, and about one lineal foot of stand space should be allowed for each pupil, with means for drying wet clothes. A sitting-room for assistant mistresses should overlook the playground and its entrances, and be reasonably near to the head mistress's room. A small cloak-room and lavatory are convenient and desirable adjuncts. It should not be less in size than an average class-room. The

GLASS LINE OF THE WINDOWS

should be nearer the floor than in the class-rooms; in this, as in other respects, the room should be regarded as a work-room and sitting-room combined. The head mistress's room, with secretary's room and a small waiting-room, must be near the chief entrance and the platform end of the assembly-room. Neither of them need be so large as a class-room, but from the windows of the head mistress's room it should be possible to see the main entrances to the building. This room is a work-room and also a reception-room; it should be well lighted, cheerful, and convenient, with a lavatory near at hand. Stairs should be of reasonably fire-resisting materials, which will not become slippery, have easy gradients, wide treads, and shallow risers, suitable for the younger children; thoroughly well lighted, and at least 4ft. wide, to enable two files of pupils to pass each other. Those to cloak-rooms, or where there is an exceptional amount of traffic, should have hand-rails on both sides to prevent accidents, and be, say, 5ft. wide. The position, form, and size of the staircases are most important; no greater inconvenience in a school can be conceived than a carelessly designed staircase in the wrong place. A building designed to accommodate more than, say, 150 children, should have

TWO DISTINCT STAIRCASES,

as far apart as possible, but both near the assembly-room. Winders and circular or elliptical staircases are inconvenient, and ought never to be planned for these schools, wherever it is possible to avoid doing so. The rise of each step should not exceed 6 $\frac{1}{2}$ in., 6in. is better when obtainable; 11in. should be the minimum width of the tread (from nosing to nosing). Staircases need not be lofty, if sufficient head room and ample lighting be secured. Lavatories with wash-basins to accommodate, say, 5 per cent. of the pupils at one time, and closets for, say, 3 per cent., can be in most cases conveniently arranged on two or more floors in a separate wing or other suitable position, disconnected from the main building by a staircase or well-ventilated corridors. A bicycle store or shed has now become an essential requirement, as girls now ride to school in great numbers. It has been said that "one want creates another," and covered stores for cycles, now they have apparently come to stay, must be considered, and placed as near to the pupils' entrance as may be safe and convenient. Last, but not least, a spacious levelled playground for tennis and other games, small border gardens for the pupils' botany specimens, cricket and hockey meadow, &c. The endowed schools have often

EXTENSIVE PLAYGROUNDS.

Trees upon the site should be judiciously preserved for their own sake as beautiful objects, and for the sake of the shade afforded in hot weather. Seven feet is a desirable width for main corridors, which should not be of less height than the rooms adjoining. Windows at each end are essential, and there should be ample lighting throughout, especially at points where they deviate from a straight line. Having thus briefly noted the requirements, let us now consider the three types of plans before mentioned. It will be seen that in this type the assembly-room is treated as a separate room, and does not afford access through it to other rooms. It can therefore be used for drill, singing lessons, special classes, and other pur-

poses without causing inconvenience and hindrance to work going on in the class-rooms, and also without the work going on in the assembly-room being interrupted by children passing through from the class-rooms. That is an obvious advantage provided at the cost of constructing the corridor. The corridor constitutes the chief variation between this type and another, as will be seen later on. In this design the most important story is the first floor, which is approached by covered stone steps. The head mistress's room is on the right of the vestibule, and a waiting lobby on the left. Two class-rooms and a corridor are entered from this lobby; other class-rooms are on the right, and two at the left in a line with the assembly-room.

TWO WELL-LIGHTED STAIRCASES,

one at each end of the corridor, lead from the ground floor to the second floor, and there are large borrowed lights between the assembly-room and corridor, and over each class-room door. On the second floor are class-rooms over those below, a small laboratory over the head mistress's room and vestibule; one of these class-rooms is fitted as a science lecture-room, and a large studio at the end of the assembly-room. On the ground floor are the pupils' entrance, with cloak-rooms on the right and dining-room on the left, a gymnasium under part of the assembly-room, mistress's room, lavatories, tradesmen's entrance, kitchen, and offices, two rooms for special work, furnace chamber, fuel store, serving room, &c. There is access to the playground at three points. Most of the class-rooms are lighted from the south-east, the assembly-room faces north-west, and the studio north-east. This school accommodates 320 pupils, and is found, after being in use for twelve years, to be convenient and suitable for the purpose. The playgrounds attached to the school are exceptionally extensive for a high school. Classes are held there under the trees in summer. Where the rooms are

GROUPED ROUND A CENTRAL HALL,

some of them will be less cheerful than others, owing to the diminution of direct sunlight. The noise of drilling and singing will interfere more or less with the work going on in the adjoining class-rooms, and the passing of children from the class-rooms to other parts of the building will tend to disturb the work going on in the assembly-room. To set against these drawbacks, which are possibly more apparent than real, there are many advantages, viz., compactness of plan, economy of space, increased facilities for effective supervision, &c. The assembly-room gives access to two stories of class-rooms, the upper ones being entered from a gallery arranged on all four sides. This form of hall is easier to light than would appear at first sight. In fact, one has to be very careful indeed to avoid having too much lighting surface, which, it must never be forgotten, is also chilling surface in cold weather and heating surface in summer time. It is a common and fatal error to under-estimate the value of a square foot of top-light—fatal to comfort, convenience, and health. The assembly-room is occasionally used also for prize distributions, lectures, concerts, private theatricals, and similar functions, and by this plan the adjoining rooms and galleries can be used to increase the accommodation for visitors and parents. Plans of this type are a variation upon

THE CENTRAL HALL TYPE,

inasmuch as there are no class-rooms upon one side, from which the hall is lighted through windows in the only external wall. In this form of plan the class-rooms are grouped along the quietest or most cheerful side of the building, the assembly-room, studio, laboratory, cloak-rooms, and other rooms occupying positions which are less important in this respect. Galleries are required only on one or two sides, and the drawbacks of the central hall type of plan are somewhat less in this type. The conditions of the site usually settle which type of plan shall be used. There are, of course, some sites where all sorts of variations and adaptations will be found necessary. Some peculiar and exceptional opportunities for skilful and

picturesque planning arise when one has an existing building to utilise and fit in. The width of doors to class-rooms should be limited to dimensions which will permit the passage of the usual moveable furniture; 3ft. to 3ft. 3in. is usually sufficient. Those to studios, corridors, cloak-rooms, dining-rooms, entrances, &c., should be wider, with pairs of doors hung folding or to swing as may be found desirable.

GLAZED UPPER PANELS IN DOORS

and also a second door leading from one class-room to another are very useful in assisting supervision and maintaining discipline. Glass panels are sometimes objected to for apparently good reasons, but they are usually found to be convenient. The essential points to be borne in mind regarding windows are:—The chief lighting for all rooms, except those for science teaching, should be in one wall only, that on the left-hand side of the pupils, with an extra window conveniently arranged where possible for cross ventilation or extra sunlight. The glass line should be as near the ceiling as possible, and not nearer the floor than 3ft. 6in. or 4ft. in class-rooms, and the glass should be clear, except in lavatories and a few other positions. The window frames should be as near the outer surface of the wall as appearance, Building Acts, and other circumstances will permit, to afford means for obtaining admission of air without interfering with blinds, &c., and also to allow the

MAXIMUM OF FLOOR SPACE

to be used without the desks being placed too close to the glass. All windows should be made so as to be opened easily by children, and to the fullest extent possible, and should be constructed to permit portions of them to remain open if desired while work is going on, without the possibility of downward currents of air being felt by the pupils. The most suitable kinds of windows are those which can be opened most readily, and which, when open, will not admit rain or expose the occupants of the room to strong currents of air. French casements and centre-hung sashes, although very useful in some positions, are not, as a rule, desirable for class-rooms. Double-hung sashes, with hopper casements over them, hung to the transome, are a common and useful form of window. Hopper casements hung to sill and to transome, with centre or side-hung sashes between them, are found convenient, and comply with the conditions above referred to. In the wall opposite to the windows, openings near the ceiling, fitted with hopper casements, are extremely useful.

IN OBTAINING CROSS VENTILATION

of the rooms during the intervals for recreation and when the school is closed. Fireplaces are conveniently arranged in the wall facing the children, not in the centre, if it is possible to place it either near the door or in the corner near the windows, especially when warm air grates or stoves are used, as then the cold air inlets are short and accessible. It is very important that all stoves or grates used for warming the air should be capable of being taken to pieces to allow the air channels to be kept clean.

CLOAK-ROOM FITTINGS.

Stands from 5ft. to 6ft. from centre to centre; seats and boot-racks, with hot-water pipes below them, are usually provided. Where this is not possible, other means for occasional drying of damp clothes are desirable. Cement, asphalt, tiles, wood blocks, or similar materials capable of being readily cleaned are most suitable for the floors; cement or varnished wood for dados.

(To be continued.)

M. FREMIET, the sculptor, has finished the head of the colossal statue of the late M. de Lesseps, which is to be set up at the entrance of the Suez Canal. The figure is six times larger than life, and will consequently be over 30ft. in height. Over the European dress a burnous is to be thrown, and one arm outstretched will point to the great engineer's work, and indicate, as it were, the way up that unromantic ditch.

INSTITUTE EXAMINATIONS.

LIST OF SUCCESSES.

AT a general business meeting of the Royal Institute of British Architects, on Monday week, Mr. W. M. Fawcett (vice-president) presiding, results of the preliminary and intermediate examinations, held in London, Manchester, and Bristol, and of the final and special examinations in London during November, were made known by the Secretary as follows:

PRELIMINARY.

E. P. Archer, Finchley; E. G. G. Bax, Catford; W. L. Binney, Hampstead; C. A. Birch-enall, Prestwich; L. Blanc, Edinburgh; L. Boden, Bowdon, Cheshire; G. H. Briggs, London; R. W. Caldwell, Glasgow; E. W. Chennells, Hemel Hempstead; J. D. Clarke, London; A. C. Cooke-Yarborough, Ramsgate; W. Craig, London; H. W. Cubitt, Lowestoft; C. J. T. Dadd, London; W. S. Dean, Boscombe, Bournemouth; H. Eddison, Lincoln; E. F. M. Elms, London; J. Ewing, Berwick-on-Tweed; C. W. Ferrier, London; F. J. Forster, Darlington; H. L. Goldsmith, New Southgate; D. Good, Highbury Hill; B. Greig, London; C. F. Grundy, Loughborough; F. E. Gulleys, Wrexham; C. H. Heaton, Wigan; H. E. Henderson, Leeds; S. G. Hewitt, Birkenhead; T. J. Hill, Longsight, near Oldham; A. Holstead, Halifax; F. J. Horth, Shustoke, near Birmingham; R. Hosking, London; T. A. Jaques, London; R. C. Jones, Menai Bridge; F. W. Knight, Wimbeldon; F. A. Ling, Winton, Bournemouth; A. H. Longhurst, Barnes Common; J. A. K. Mackenzie, Bournemouth; W. Martin, Buxton; A. R. Meldrum, Aberdeen; F. L. Morley, Merion, co. Dublin; C. P. Moss, Crouch Hill; P. P. Nathan, Notting Hill; J. J. S. Naylor, London; C. E. New, London; G. Norman, London; G. H. Onions, Tipton; G. M. Page, Nottingham; J. H. Petch, Scarborough; P. Procter, London; H. M. Reynolds, Lincoln; F. V. Rider, Notting Hill; R. McM. Roberts, Warrington; A. Rollo, Glasgow; E. Rothwell, Walkden, near Bolton; G. F. Royds, St. Mary Bourne, near Andover, Hants; G. L. Russell, London; A. H. Salisbury, Harpenden; H. O. Samsen, Taunton; N. O. Searle, London; G. H. Sheppard, Newport, I.W.; H. D. Simpson, Kilmarnock; J. G. Smart, Edinburgh; H. F. Smith, London; F. E. Stratton, Salisbury; R. Stubbs, Winsford; P. Sturdy, Bournemouth; J. Swarbrick, Manchester; A. S. Tanner, London; H. Tebbutt, Bedford; A. D. Thacker, Walsall; R. P. S. Twizell, Newcastle-on-Tyne; G. Walker, Barrow-in-Furness; J. W. Walker, Aberdeen; S. Warwick, London; R. C. Wiles, Richmond; C. B. Wilson, Kendal; R. G. Wilson, Aberdeen; J. J. Wood, Leeds; C. Woodward, London.

INTERMEDIATE: NEWLY-REGISTERED STUDENTS.

C. T. Adshead, Stockport; G. W. Hayward, Manchester; P. E. Nobbs, Edinburgh; L. G. Bird, Chatham; S. M. Mould, Gosforth, Newcastle-on-Tyne; J. D. Mills, Tayport; G. R. C. Harding, Beckenham; L. W. Green, Datchet; S. H. Hamp, Wembley; E. F. Knight, London; L. C. Gregory, London; A. E. Gibbins, Brighton; A. L. MacGibbon, Edinburgh; J. E. Franck, London; S. W. Bensted, London; M. Honan, Liverpool; A. B. Botterill, Weston-super-Mare; E. G. Rodway, Weston-super-Mare; C. F. Newcombe, Gosforth, Newcastle-upon-Tyne; C. H. Bennett, Macclesfield; F. H. Allen, Kettering; H. P. Anson, London; E. Bates, Thornton Heath; A. E. Biggs, London; J. P. Bishop, Forest Hill; W. H. Bourne, London; G. D. Copland, Glasgow; H. E. Gifford, Edwalton; H. Jardine, London; H. L. E. Merille de Colleville, Brighton; A. H. Roe, Brockley; N. T. Salmon, Reading; F. J. O. Smith, London; R. H. Spalding, London; A. M. Torrance, London.

FINAL: QUALIFYING FOR CANDIDATURE AS ASSOCIATE.

J. F. Duthoit, Dover; L. Hobson, Liscard; W. C. Hulbert, Wimbeldon; W. McCulloch, St. Andrews, Fife, N.B.; D. C. Maynard, London; E. H. Morton, London; J. Ormrod, London; H. J. Pearson, London; H. Shepherd, Richmond.

Professional Items.

BIRMINGHAM.—The scheme for providing Birmingham with a new arcade, or rather series of arcades, in the heart of the city has now reached maturity so far as the first and most important stage is concerned—viz., the negotiations for acquiring the various properties included in the proposed area, and the adjustment of the many intricate preliminary points with which the promoters have had to deal. The arcade is to have three main outlets, viz., in New Street, High Street, and in Union Street, but the proposal to bring the latter branch out at the corner of Corporation Street and Union Street has had to be abandoned, and the plans now provide for an outlet on the site of the Old Library in Union Street. The distance traversed by the new arcades will be upwards of a quarter of a mile, and their width will be the same as that of the Great Western Arcade.

CARDIFF.—A very artistic floral depot has been erected for Messrs. Case Brothers in a prominent position on the Newport Road, near Clifton Street, Cardiff. The building occupies a frontage of 50ft., and has been built from the design of the architect, Mr. Fred C. Stibbs. The centre of the building will be used as a shop and will have an entrance from the Newport Road. The two wings will be utilised as show houses. Messrs. Duncan and Tucker, horticultural builders, of London, were entrusted with the contract for the building.

The foundation stone of a new edifice, which is in the course of construction for Richmond Road Congregational Church, has been laid. The church is designed in the late Gothic style of Architecture, and will be one of the finest Nonconformist churches in the town. It will have three main entrances from Richmond Road, besides two minor outside doorways to the vestries. One of the most striking external features of the building will be its tower, which stands at the right-hand corner of the edifice over one of the main entrances. The spire surmounting the tower will rise to the height of nearly 120ft., and will be visible from almost any part of Roath. The windows will be of cathedral glass. The edifice will be lighted by electricity. Its total cost is estimated at about £5500, the architects being Messrs. Habershon and Fawckner, and the contractor, Mr. D. Davies, Cardiff.

ERROL.—The new Victoria Hall, Errol, is situated at the west end of the village, and has a frontage to High Street. The building is capable of seating from 250 to 300 persons. Outside it has a neat and finished appearance; internally the arrangements are of a very complete description, both as regards fittings and general acoustics. The architect was Mr. Alexander Johnstone, Dundee; while the contractor was Mr. Robert Goodall, Errol.

LONDON.—The examinations in practical Sanitary Science took place on December 3rd and 4th at the Sanitary Institute, Margaret Street, W. The examinations in sanitary building construction, instituted by the Worshipful Company of Carpenters, were held on the same dates, at Carpenters' Hall, London Wall. The distribution of the prizes gained by the workmen students in the Trades Training Schools, Great Titchfield Street, W., will be made at Carpenters' Hall, London Wall, on Wednesday, December 15th.

Mr. Charles Wall, the contractor for the reconstruction of Highgate Archway, has commenced operations. Several loads of timber have been placed on the Islington and London side, and stout piles have been erected on the Hornsey and Middlesex side. A temporary building has been erected at the Highgate end, and workmen will at once begin a difficult part of the work, diverting the mains of the New River Company. The footway will be maintained on the north side during the construction of the southern half, and a temporary footway will be formed on the south side,

while the northern position is being removed. Vehicular traffic will have to be diverted.

A new hall and gymnasium has been presented to the Young Women's Christian Association by Mr. Howard Morley. The site is in the rear of the new headquarters of the Association, 26, George Street, Hanover Square. This large building was acquired about a year ago, as a freehold, at a cost of £20,000, but alterations have had to be made, and a lift and the electric light have been provided, raising the outlay to about £27,000, of which £7000 is still required. The hall and gymnasium now in course of erection, where there were formerly stables, will cost, with furnishing, about £3800; the gymnasium will be in the basement, and the hall over it will furnish accommodation for between four and five hundred persons. The architects are Messrs. F. W. Porter and Son, of Russell Square, and the builders are Messrs. Higgs and Hill, Crown Works, South Lambeth.

MANCHESTER.—The fountain which is in course of construction on the site of the temporary Thirlmere fountain, in Albert Square, is the gift of an anonymous donor, and is to cost £1000 or £1200. The design is by Messrs. Thomas Worthington and Son, architects, of Manchester. The fountain is hexagonal on plan, and consists of a lower basin, 21ft. in diameter, standing upon a raised platform of three steps of grey Scotch granite, and is constructed of finely-axed, unpolished, red granite from the Hill-o'-Fare quarries; it has a square pier, with moulded cap and base at each of the six angles, the sides of the basin between the piers being boldly moulded. From the centre of this basin rises a second one, 9ft. in diameter, made of the finest Bolton Wood Sandstone, a close-grained material adapted to withstand the action of the water. This basin has a moulded base at the surface of the water in the lower one, upon which stand six triple shafts of red granite, having carved capitals supporting the overhanging corbelling of the bottom of the basin. The erection of the fountain was entrusted to Messrs. J. and H. Patteson, who also executed the adjoining Albert Memorial from the design of Mr. Thomas Worthington. The dolphin has been modelled by Mr. John Cassidy.

MONMOUTH.—The new high school, built on the foundation of Jones's Charity, has been opened. The building stands on an eminence on the north side of the town; it faces south, commanding a splendid view of the Wye valley, both up and down the river. The building is of the Victorian Era style, and stands on 2½ acres of ground, and will accommodate an hundred day scholars and fifty boarders, as well as the staff. It is built of local sandstone and greenmore stone, with dressings of Bath stone, the whole of the stairs and corridors being of stone, and fire-proof. The building is heated by boilers fixed under the basement; there is a tank at the top of the house which holds 7000 gallons, and it is supplied with fire appliances and several hydrants outside. On the basement there are three class-rooms, ten music rooms, drawing-room, library, &c., and the hall, which is 60ft. by 29½ft. On the first floor there are five dormitories, a general bathroom with five baths, teachers' day room, students' day room, the head mistress's apartments, and three single rooms for teachers; this floor is approached by three flights of fireproof stairs. The second floor has seven dormitories, three single rooms for teachers, a sick ward, bath, &c.; the latter are isolated from the rest of the building. On this floor there is also a bathroom with four baths; this floor is approached by two flights of stairs. There are lifts from the basement to all the floors for domestic purposes. The central front block is surmounted by the arms of the Haberdashers' Company and that of the donor, William Jones. The principal entrance is through an iron carriage gate, flanked by iron railings. The building cost £20,000. The architect is Mr. H. Stock, and the contractors Messrs. W. Gradwell and Son.

NEWCASTLE.—The new lecture hall of Salem Church, of the Methodist New Connexion, at the corner of Falconar Street and Camden Street, Newcastle, has been opened. There is erected a spacious platform; cloak and class rooms, &c. The interior of the building has been decorated by Mr. G. G. Laidler, Northumberland Street. The heating apparatus has been supplied by Messrs. Henry Walker and Sons, and the seats provided by Mr. Stockdale, of Gateshead. The contractor, Mr. J. C. Hope, had charge of the general arrangements, whilst the whole of the work has been executed under the supervision of Mr. R. L. Hay, the architect.

NORWICH.—The new Royal Hotel, recently opened, stands at the top of Prince of Wales Road, immediately opposite the Post Office and the Agricultural Hall. The plot of land on which it has been built is of an awkward shape, and no little ingenuity was demanded on the part of the architect to design a building that should have a bold and elegant frontage. As a matter of fact, the frontage is very extensive, and forms almost a perfect arch. The basement on the Bank Street side is the kitchen department, with a kitchen 40ft. by 26ft., scullery 30ft. by 10ft., and ample larder and pantry accommodation. The whole are ventilated into one large main shaft to the top of the building. The portion next Upper King Street is set apart for the various departments of the working staff. The ground floor shows, perhaps, the best piece of planning, with its large hall, 40ft. by 30ft., with manager's room attached, and office and porter's room on the right and left of the main entrance. At the back of the hall there is a winter garden, 30ft. by 20ft. Next to the large central area, in the centre of the building, is a light and airy corridor right round the building, thus giving access to the different rooms. From the large hall is approached the main fireproof staircase with passenger lift, and entrance to the reception-room with cloak-room attached, these being next to the large dining-room, some 60ft. by 30ft., with panelled walls and teak floor. This is a room of many different angles, with circular bay, and a variety of windows. The first floor is devoted to suites of rooms and to a large central drawing-room, with bold bay window and French casements to balcony. This room is rendered very interesting by the fact that it is ceiled in with a celebrated old ceiling removed in pulling down Messrs. Foster and Burroughes' offices. Next to Bank Street is a two-table billiard-room, with ample top light and ventilation. There are also three large stock-rooms. The upper floors are given up to bedrooms, a service lift running up to top floor, and each floor having double bath-room and lavatory for gentlemen and ladies, all being amply ventilated and lighted. The elevations are composed of red facing bricks and Messrs. Gunton's Cossey ware. The building is roofed in with green slates, and may be described as being of the Flemish style of Architecture. The contractor was Messrs. J. Youngs, and other firms were Messrs. R. and A. Main, the heating and cooking engineers; Messrs. Barnes and Pye, the ironfounders, who supplied and fixed the ironwork; Messrs. Laurence, Scott, and Co., lifts, bells, lighting, &c.; Messrs. Trevor, Page, and Co., who decorated the principal rooms; and Messrs. Maple and Co., decorators and furnishers. Messrs. Edward Boardman and Son are the architects.

PUDSEY.—The new Baptist chapel, erected at Littlemoor, Pudsey, has been opened for public service. The new edifice has been erected from the designs of Messrs. Hodgson and Farrar, architects, Bradford and Pudsey, and is in a plainly-treated classic style of Architecture, the front being relieved with dressed ashlar piers and moulded cornices. The chapel, which has a gallery running on three sides of it, provides sitting accommodation for about 600 persons. At the east end is a choir and organ gallery, separated from the chapel by a large semi-circular arch. The rostrum, which forms a central feature, is

elaborately treated, and is of pitch pine and mahogany. The ceiling of the chapel is treated with a lantern running the length of it, relieved with ornamental plaster work. The artificial lighting is by means of Stott-Thorpe ceiling lights, the heating is by hot water on the low pressure system, and the ventilation is on the most approved principle.

SHEFFIELD.—A very encouraging start was made in the library of the Montgomery Hall with the course of lectures to be given by Mr. Hugh Stannus, Lecturer at the Royal College of Art, South Kensington, on "Some of the Classic elements of Architecture." Ten addresses are to be delivered, and the attendance at the first, in which Mr. Stannus treated of the origin, function, names, and individual treatment of mouldings, was considerably larger than Mr. C. J. Innocent, the honorary secretary, and the other members of the Sheffield Society of Architects and Surveyors, who have been the means of bringing Mr. Stannus to Sheffield, had anticipated.

SKIPTON.—The large and handsome new club premises in connection with the Skipton Liberal Association are now completed. The total cost of the premises amounts to nearly £5000. The building fronts to Keighley Road and Sackville Street. On the ground floor there are six large lock-up shops, near the centre of which is the main entrance to the club, above these being a wide staircase and corridors leading to all the rooms. On the first floor there are smoking-room, reading-room, and library, and the two former are connected by sliding doors, so that they can be made into one room to seat at least 150 people. There are three other rooms on the same floor, besides bath rooms, &c. On the second floor there are two recreation-rooms and curator's private room. On this floor there is a very large billiard-room, 52ft. by 32ft. 6in., containing three full-sized tables. Adjoining this is a private billiard-room. The top floor also contains the curator's living rooms. The heating is done from a cellar under the staircase. Mr. James Ledingham, of Bradford, was the architect.

STAPLEFORD.—The new Board School for Boys, at Stapleford, has recently been opened. The school has been in course of erection about twelve months. The building was designed by Mr. W. H. Higginbottom, architect, of Nottingham. The main entrance leads direct into the central hall, which is 61ft. long and 25ft. wide. Additional entrances and exits are also provided at the opposite end of the building. The class-rooms, six in number, are arranged four on one side and two on the other, each being 25ft. by 24ft., accommodating sixty scholars. The building is so planned that two class-rooms may be added at a future time. The master's room is arranged over the back cloak-room, and has immediate access to the balcony, from which the master is able to see into most of the rooms of the school. This room also commands a good view of the playground. The floors of the central hall and class-rooms are of wood blocks, and the floors of the cloak-rooms and corridors are of Val-de-Travers. The whole of the internal walls of the hall, class-rooms, and cloak-rooms have a glazed brick dado, 4ft. 6in. high, above which the walls are colour-washed. The heating is by means of low pressure hot-water pipes. The ventilation has been carefully considered, and it is effected by means of sliding doors in ceilings, communicating with a continuous ventilator on the ridge. For extra summer ventilation several of the windows open close to the ceiling. The building externally is faced with red bricks, with stone dressing, and the roof is covered with slates. The school has a large playground, which is asphalted, and there is a large covered playshed in the yard for use in wet weather. The work has been carried out at a cost of about £3000, and the contractors were Mr. Charles Moulton (bricklayer, &c.), Messrs. Pacey and Henson (joiners), Mr. E. Fisher (painter), all of Stapleford; and Mr. H. Shardlow (plumber), of Hyson Green.

THE WINTER SESSION.

LANCASHIRE ANTIQUARIANS.

At a meeting of the Lancashire and Cheshire Antiquarian Society, held at Chetham's College, Mr. Mallalieu exhibited and described some recent finds from Castleshaw, and the Rev. E. F. Letts read a short communication, "De Pictis Britannicis." Colonel Fishwick gave some account of the disputed boundary in Ashworth, temp. Edward VI., after which Dr. Renaud read a paper which had relation to a series of abbreviated deeds concerned, with early tenures of land in Minshull Vernon and adjoining townships, in Cheshire.

THE BROADWAY THEATRE AT NEW CROSS.

On Saturday, November 27, the Goldsmiths' Institute Architectural and Building Society paid its first visit to the Broadway Theatre, by the permission of Mr. Sprague, the architect. The theatre is one of the latest additions to London's playhouses. It has a bold and massive appearance as viewed from the Broadway, and is constructed throughout of fire-proof materials. The elevation is of handsomely carved stone of a good design. The theatre is a modern three-tiered one, fitted with electric light and all the latest ideas. The gallery and balconies being constructed on the cantilever system, a good view of the stage can be obtained from every part of the house. The stage compares favourably with London stages as to its size, it being 72ft. by 38ft. The work is proceeding at a rapid rate, and the building is to be opened by December 20. The visit terminated with a vote of thanks to the Clerk of the Works, who conducted the party.

THE NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

Mr. W. J. Barton, secretary of the Nottingham Master Builders' Association, writes us:—This Association has now permanent offices at Bentinck Buildings, Wheeler Gate, with a room set apart as committee and reading-room, and we are forming a library of books connected with trade matters and also of catalogues and price lists, &c., of all goods, appliances, &c., used by the building trades. We therefore invite all manufacturers, merchants, and factors to send full particulars of their goods, which will be placed in the library for reference.

MANCHESTER SOCIETY OF ARCHITECTS.

The thirty-third annual dinner of this Society took place at the Queen's Hotel. The president of the Society (Mr. John Ely) occupied the chair, and the company included the President of the Royal Institute of British Architects (Professor Aitchison, A.R.A.).—The president proposed "The Royal Institute of British Architects and its President."—Professor Aitchison, in his reply, urged the importance of Architecture as a factor in a nation's progress, and pointed out how difficult it was for Architecture to advance unless the public took an interest in it. There were special difficulties in the way of the architect, for whereas the products of genius in music and in painting could be exhibited all over the world, the works of the architect could not so be treated. Unless there was some strong love for a thing, or some considerable appreciation of it, he did not see how it was possible to expect persons to devote their whole lives to it, and more especially those who had a natural genius for it. It seemed to him that the public were considerably mistaken in the view they took of Architecture, and he could wish that in such a town as Manchester particularly, where there was much mental activity, and whose wealth was enormous, a greater interest were taken in the profession of Architecture. He trusted that greater interest would be taken in this matter, and that it was not too much to hope that in the far-off time people would come from the east and the west, as they now went to Athens and Rome and Florence, to sketch and take note of the great works of Architecture found within its precincts.

Enquiry Department.

We have pleasure in announcing that the services of specialists in every branch of the building industry, or representative of every phase of architectural thought, have been secured in connection with our "Enquiry Department." We shall at all times be pleased, therefore, to receive queries from correspondents, and lay them before the specialists concerned, who, in their turn, will be pleased to give the fullest and most accurate information.

GEOMETRICAL PROBLEMS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I am working out some practical problems in geometry, including the trisection of any given angle, formation of polygons of five to twelve sides, inscribed circles in triangles and compound angles, and the square and circle problem, &c.

The geometrical solution of some polygonal figures, the trisection of a given angle, and the squaring of the circle are said to be impossible. I submit my methods are more nearly correct than any yet published, and are valuable for teachers and students, besides being more direct and easy for the young draughtsman and mechanic.

I shall be glad of your valued opinion as to the publication of the above, if upon inspection they are found to be as valuable as they are interesting.—Obediently yours, R. R.

A series of practical solutions to geometrical problems at present considered impossible of solution might well form the basis of a new book on Plane Geometry—of which, however, there are so many already on the market that it might be difficult to find a publisher for another. It always pays an author best to publish such a work first in serial form, and although we fear that the subject is somewhat too academic in character for the pages of this journal, we should be glad to see our correspondent's solutions, and to pass an unbiassed opinion upon them.

A QUESTION OF LIABILITY.

To the Editor of THE BUILDERS' JOURNAL.

SIR.—One of my ground landlords has recently served me with notice of dilapidations. These will shortly be carried out. His solicitor has recently informed me that whether the dilapidations are finished by the time mentioned in the notice or not, he will demand his expenses, and that the surveyor's should be paid by me. Will you kindly inform me whether I shall be in the right in refusing payment of the same?—Yours truly, J. G.

Counsel's opinion, which has been taken on the point by our solicitor, is as follows: "Referring to the enquiry as to whether or not a ground landlord is entitled to recover his solicitor's and surveyor's expenses in connection with serving a notice of dilapidations under a lessee, even though the lessee after receipt of the notice duly carries out the works specified in such notice within the time prescribed by such notice, I am of opinion that the ground landlord is entitled to claim the reasonable and proper charges of his solicitor and surveyor in connection therewith."

EXAMINATION IN BUILDING CONSTRUCTION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should deem it a favour if you could tell me whether or not there is a firm publishing the examination paper of the Science and Art examinations in building construction with the answers worked out; if so, kindly state price and any further particulars.—Yours truly,

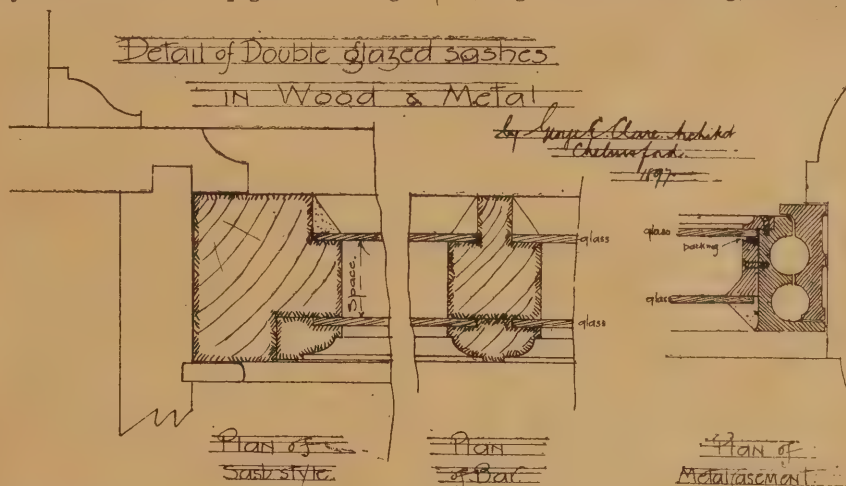

WHITE ROSE.

The book you require is "Key to the Science and Art Examinations, Subject 3, Building Construction," by Henry Adams, C.E. Price about 3s. 6d. It is published by Chapman and Hall. The Science and Art Department publishes its own questions, but without the answers.

Views and Reviews.

PAINTING AND DECORATING.

It is a pleasure to notice that at last a thoroughly good and reliable text-book upon painting and decorating has been produced, and the author, Mr. W. J. Pearce, is to be highly congratulated upon this final result of many years of labour. Written by a painter for painters, the book is a collection of carefully arranged facts, clearly put and well described, so full and complete that it would be difficult to imagine that anything further could be added about the painter's craft, while so well arranged and supplied with so good an index that whatever might be wanted could be found with the least possible delay. Unfortunately, four coloured plates have been introduced, or, it may be, fortunately, for their very crudeness acts as a foil, only setting off more plainly the beauty of the many black and white illustrations. Still, it is a very great pity that a book which is sure to become the leading text-book for all young painters should have such remarkably bad coloured illustrations. They are almost sure to be taken as models, and their influence for evil would then be hard to exaggerate. It would have been better to have omitted them entirely. In fact, it is questionable whether a book which is almost entirely devoted to hard technicalities ought to contain any ornamental designs whatever. In the preface the author claims that these are explanatory of the text, and of the application of the principles advocated in the book; but it is difficult to see how this is the case. Take, for instance, the carefully laid down rule on page 232 that sign-

writers should not sacrifice legibility to elaboration, and compare this theory with practice as exemplified in the head lines to Chapter XI! It will, therefore, be understood that while the book is a good one when considered from a practical standpoint, it is necessary to take it with caution upon matters of design, and to reject it entirely upon taste in colour. It contains useful chapters upon "The Philosophy of House Painting"; "The Workshop and Stores"; "Plant and Appliances"; "Brushes and Tools"; "Materials"; "Colour Mixing"; "Distemping"; "Painting"; "Staining"; and several allied crafts, such as "Wall Papers," "Lettering," "Sign Writing," and "Decoration in Relief," the whole winding up with a few valuable notes on "Measuring and Estimating," with a kind of appendix upon "Coach Painting."

"Painting and Decorating." By W. J. Pearce. (Chas. Griffin and Co. Limited, Exeter Street, Strand. Price 12s. 6d.)

A BILL has been drafted conferring upon the County Councils of Middlesex and Surrey power "to construct and maintain a new bridge across the River Thames between Brentford and Kew in lieu of the existing bridge, with approach roads and accesses thereto," as well as power to raise moneys for these and other purposes.

Correspondence.

DOUBLE-GLAZED WINDOWS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Appropos the remarks made in "Bricks and Mortar" column of a recent issue, I should like to say that the advantages of the double-glazed windows have been firmly impressed on my mind for some two or three years; I worked out the idea in detail about twelve months ago, and inclose tracing of the details showing how the idea could be adapted to wood and metal windows.

In addition to the large cooling surface afforded by single-glazed windows in winter, the same surface of glass, of course, tends very much to heighten the temperature in summer; thus with double-glazed windows we should have cooler rooms in summer and warmer in winter, with a smaller consumption of coal.—Yours truly,

GEORGE E. CLARE.
Chelmsford, Nov. 25.

A WORKMAN'S REPLY.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Being a subscriber to your valuable and interesting journal, my attention is drawn to "A London Architect's" letter last week commenting on dishonest tactics of the workmen engaged in the building trades, particularly the masons and bricklayers. I have been working as a mason for nearly forty years, and the old story of men not working as hard as twenty years previously—the same old fable that has been handed down from time immemorial, and will continue to go on as long as there is building to be done—is

repeated. If "A London Builder," whose letter followed that of "A London Architect," is troubled he has his remedy, i.e., to discharge the men who are not doing their duty. I ask "A London Architect" and his friend, the builder, Is it the fault of the men that clients of the architect and the builder have to suffer? I venture to assert, and prove it if necessary, that in no trade is there more jobbery and corruption than in the building trade. Having worked in many towns, I am speaking from experience when I say that 90 per cent. of the contractors in this country never intend to fulfil their obligations, and in many cases with the connivance of the architect, or, failing him, the clerk of works. I have been on jobs specified for the very best hard stone, and scarcely any has been used, stone being substituted of a soft nature of neither the price or the quality. Such actions, putting hundreds of pounds into the pockets of the contractors, are carried on before the eyes of the architect and clerk of works, and this deception permeates the whole of the branches of the trade. In conclusion, I would say let architect and contractor clean their own slates of the corruption which exists amongst them, and not fall back upon a bogey that has been used before they were born, and is only imaginary.—Yours,

Leeds, Nov. 28. STONEMASON.

Trade and Craft.

BRIDGING THE STOUR.

For some time past a scheme has been on foot to increase communication between outer Kent and the Isle of Thanet, by bridging the river Stour at a spot known as Pluck's Gutter. At a recent meeting of the Isle of Thanet Rural District Council, the report of the Joint Committee of the Thanet and Eassey District Councils, with reference to the proposed bridge, was presented. Promises of land had been obtained, and it had been ascertained that the Council was not liable for compensation in respect to any ferry rights at Grove Ferry or Sandwich Bridge. The probable cost, including certain alterations in the original scheme, would be about £10,000. The Committee recommended that steps be taken immediately to promote a provisional order for carrying out the undertaking.—The Rural District Council adopted the report.

MESSRS. PETERS, BARTSCH AND COMPANY.

This well-known firm are the makers of the patent Carbolineum Avenarius, a compound that should be of great service to builders and others. Its properties act as an efficient preservative of wood, forbidding decay through dampness and other causes. Without the application of any pressure Carbolineum Avenarius penetrates into the wood and has the effect of driving out the moisture. On the other hand it does not stop up the pores of the wood and so cause dry rot. It can be used not only to new wood on interior or exterior building work, but to existing structures, such as sheds, platforms, bridges, landing-stages, &c., poles, posts, fences, timber in mines, also on board ship, to wood paving blocks, and, in fact, upon any wooden material, as well as to stone and ropes. Where decay has commenced, by removing the affected part and applying Carbolineum protection is afforded. It possesses properties that are deadly to insects, and thus is of great service when used in nurseries, stables, cowsheds, &c. It also has the advantage of being non-inflammable; it can be applied either by painting or immersion, and one gallon will cover from thirty to fifty square yards, according to the nature of the material and surface. Another speciality of Messrs. Peters, Bartsch, and Company is their Anti-oxide enamel paint, which affords protection against rust on all kinds of iron structures and machinery. Its efficacy has been greatly commended by users of it. Messrs. Peters Bartsch and Co. are also the proprietors of the patent Indestructible Combination Washers, for flange joints of steam and water pipes. These washers consist of rings of soft metal, grooved outside, and holding in the groove packing material, such as asbestos, rubber, hemp, &c.; they are said to accommodate themselves readily to any unevenness in unplanned flanges. They have been tested up to 2300lb., and have been found to resist the highest pressure; they cannot be blown out. They are not only applicable for engines, heating and hydraulic apparatus, but can be used for sanitary purposes in drainage and so forth. Amongst the other specialities supplied by the firm—whose head office is at Derby, but who have a London office at 68, Queen Street, Cheapside—are the Carbotron portable stoves, which possess several unique advantages. Used with the Carbotron Heating Company's smokeless and non-smelling fuel, there is no danger of flying sparks, and, when lighted, they require no further attention from six to twelve hours, according to the regulation of the ventilators. They can be moved about whilst alight, and placed upon wood floors without any risk of fire, and can be used in entrance halls, corridors, offices, shops, warehouses, hot-houses, &c., where there is no chimney; and in lavatories in the winter to prevent water pipes and fittings freezing and bursting. In this latter respect their value cannot be over-estimated, as in the winter season much inconvenience, as well as damage, is frequently caused through a want of warmth to pipes and fittings.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BLACKWELL (Derbyshire).—For making up Kirkstead-road and certain streets for the Rural District Council. Mr. Hy. Silcock, surveyor, 20, Westgate, Mansfield:—

Lane and Son	£324	John Tomlinson, South
H. H. Barry	324	Normanton (accepted) £354
Joseph Tomlinson	324	

Barry	£368	John Tomlinson, South
Lane and Son	308	Normanton (accepted) £223
Joseph Tomlinson	280	

Barry	£311	John Tomlinson, South
Lane and Son	270	Normanton (accepted) £217
Joseph Tomlinson	256	

Barry	£331	John Tomlinson, South
Lane and Son	295	Normanton (accepted) £208
Joseph Tomlinson	257	

BRADFORD.—Accepted for two steel lattice foot-bridges, at the workhouse, for the Guardians. Mr. F. Holland, engineer, 110, Parkinson's-chambers, Huddersfield, Bradford. Quantities by the engineer:—

J. Bagshawe and Sons, Limited, Batley	£514 16
BRADFORD. —For steam-boiler setting and house for same at the workhouse, for the Guardians. Mr. T. Barker, engineer, 5, Bond-street, Bradford:—	
B. Jackson and Sons £377 10	Walter R. Booth £270 0
William Holdsworth 339 0	Toothill and Balm-forth* 264 11
John Moulson & Sons 330 0	
Humphreys & Moulson 300 12	

BRIDLINGTON QUAY (Yorks).—Accepted for additions, etc., to the "Bon Marche," for Messrs. Marshall. Mr. J. Earnshaw, architect, Carlton House, Wellington-road, Bridlington Quay:—

A. Gardam, Bridlington Quay	£624 8
Hick and Hobson, York	260 0

BRIDLINGTON QUAY (Yorks).—Accepted for the erection of house and shop, Hilderthorpe, for Mr. W. Moody. Mr. J. Earnshaw, architect, Bridlington Quay:—

E. Corner, Bridlington Quay	£387 15
CARDIFF. —For the erection of villa and stabling, Rumney, for Mr. J. M. Lewis, Castle-road, Cardiff. Mr. S. Rooney, architect:—	
Evans and Owen £1,528 19 6	S. Davies £1,290 0 0
Cadwalader and Hookridge 1,325 0 0	Handford and Ellisworthy £240 0 0
G. Lewis 1,510 0 0	Cox and Bardo* £1,200 0 0
Hampson and Co. 1,500 13 11½	Venning and Co. 1,150 0 0
Knox and Wells 1,450 0 0	Powell and Mansfield 1,170 0 0
Ingleson and Co. 1,335 0 0	

CORK.—For the erection of two semi-detached villas, Douglas-road, for Mr. D. J. Buckley, architect, 21, Adelaide-street, Cork. Quantities by architect:—

D. O'Callaghan, Cork	£1,150	John Buckley	860
D. Duggan, Phoenix-street, Cork (accepted)	970	J. Kietz	860

FOREST GATE.—For the erection of nine shops and dwelling-houses, for Mr. B. L. Byatt. Mr. H. J. Hollingsworth, architect:—

Edwards and Medway £9,539	Thomerson and Son	£7,790
Webb 8,179	Hearle and Farrow	6,998
Hoskins 7,795		

HORNSEA (Yorks).—For the construction of concrete reservoir, filtering chambers, etc. (Contract No. 1), for the Urban District Council. Mr. P. Gaskell, surveyor, Hornsea:—

Brunton and Son (time, four months)	£1,649 7 7
J. Bell	1,587 4 5
B. Robinson, Hull (accepted, Time, four months)	1,540 10 0
Hy. Hulst (time, eight months)	1,542 7 6

HUDDESFIELD.—For the erection of stabling, etc., and forming a bowling green, "Griffin" Inn, Crosland Moor, for Messrs. William Stones, Limited. Mr. J. Berry, architect, 9, Queen-street, Huddersfield:—

Masonry.—A. and T. Haigh, Golcar	
Joinery.—G. W. Brook, Crosland Moor	
Plumbing.—Sanderson Bros. Paddock	
Plastering and Slating.—W. E. Jovett, John William-street, Huddersfield	£355
Painting.—Thos. Cartwright, Crosland Moor	
Concreting.—John Cooke, Little Royd	

HUDDESFIELD.—For the erection of two houses, Salford. Mr. J. Berry, architect, 9, Queen-street, Huddersfield:—

Masonry.—J. Moorhouse and Sons, Meltham	
Joinery.—J. Sunderland and Sons, Lockwood	
Plumbing.—D. Taylor and Sons, Lockwood	£350
Plastering.—G. Corney, Lockwood	
Painting.—W. Eastwood, Lockwood	
Slating.—T. Longbottom and Sons, Lockwood	

IPSWICH.—For erecting Middle School, Ipswich. Mr. J. S. Corder, architect:—

G. Greenwood & Son £240 0 0	A. Marriot	£283 0 0
G. A. Kenney 782 0 0	T. Parkinson & Son	505 0 0
F. Bennet 690 0 0	W. Grayston*	587 17 6

KINGSTON.—For new roads, sewers, etc., Coombe Neville Estate, Kingston, for Mr. Wilson. Mr. A. J. Windybank, surveyor:—

Free and Son	£4,182	Kavanagh	£2,600
Cunliff	2,945	Atkins	2,405
Ballard, Ltd.	2,864	Adamson, Kingston*	2,075

LONDON.—For new Junior Mixed department, &c., at the Malmesbury-road School, Bow, for the London School Board. Mr. T. J. Bailey, architect:—

Stimson and Co.	£9,155	
W. Shurmer	9,009	163
Treasure and Son	8,669	143
W. Pattinson and Sons	8,308	163
L. H. and R. Roberts	8,151	175
E. Lawrence and Sons	7,850	151
P. and F. J. Wood	7,836	150
W. M. Dabbs	7,475	151

LONDON.—For the erection of a coroner's court and mortuaries at Catford, S.E., for the Lewisham District Board of Works. Mr. John Carline, surveyor:—

F. P. Smith	£4,815	Ham and Son	£4,313
E. Mills	4,786	Walker	3,626
J. and C. Bowyer	4,395		

LONDON.—For new road and sewers, Hyde House Estate, Battersea, S.W. Messrs. F. and W. Stocker, surveyors, 99 and 91, Queen-street, E.C.:—

Daniel Bros.	£1,100 0	W. Swaker	£625 0
Thomas Pedrette	962 0	S. Kavanagh	625 0
G. Wimpey	958 0	D. Brewer	578 10
E. King	738 0	Lawrance & Thacker	385 0
Clift Ford	660 0	T. Adams	519 0
W. Nicholls	655 0	G. Carpenter	51 0
Jno. Jackson	650 0	J. Hare, 40, Turret-grove,	
Killingback and Co.	639 0	Clapham, S.W.*	465 0
Rawlings and Son	635 0	Herbert Clark	417 0

LONDON.—For alterations and additions to Devonshire House, Stoke Newington, for Mr. W. G. Bradley. Mr. C. Jackson Shaw, architect, 81, London-road, Hackney Downs N.E.:—

A. S. Stevens	£1,611	S. Goodall	£1,310
J. R. Cordell	1,603	G. Flaxman	1,27
Steven Bros.	1,568	A. Davis, Canonbury	95

LONDON.—For sundry repairs and decorations at Nos. 7, 8, 9, and 10, Harpur-street, W.C., for the National Society for the Prevention of Cruelty to Children. Messrs. Reeves and Styche, architects, 3, Gray's Inn-square:—

Patman & Fotheringham £411	Thomas Sobey, Lambs
Hayworth and Sons 321	Conduit-street*
Campion 298	

LONDON.—For new stabling and alterations to existing buildings, for Messrs. Pritchard and Moore Brothers, at the Canadian Horse Repository, Lambs Conduit-street. Mr. John Farrer, architect and surveyor, 20, Finsbury-pavement, E.C.:—

Stevens	£1,036	T. W. Brown	£205
Steed	955	Thomas Sobey*	894

LONDON.—For alterations and additions at No. 10, Montague-place, Russell-square, W.C. Mr. James Neale, architect, 10, Bloomsbury-square, London, W.C.:—

Colwill	£230	Lidstone (accepted)	£200
---------	------	---------------------	------

LONDON.—Accepted for alterations at No. 2, Montague-place, Russell-square, W.C. Mr. James Neale, F.S.A., architect, 10, Bloomsbury-square, W.C.:—

Lidstone	£192 17 8
----------	-----------

MARKET BOSWORTH (Leics.).—For the erection of a board room, for the Union Guardians. Messrs. R. J. and J. Goodacre, architects, 5, Friar-lane, Leicester. Quantities by architects:—

H. W. Boulter	£286 0 0	Slater & Harrison	£288 0 0
J. Cowett	969 9 0	H. W. Beck, Market Bosworth*	£21 10 9
Slater and Son	912 13 10		
E. Orton	890 0 0		

NEWHAVEN.—Proposed alterations and additions to business premises, High-street, Newhaven, Sussex, for Mr. J. Bannister. Mr. Wm. Cooper, M.S.A., architect, 21, Havelock-road, Hastings:—

M. Woolger, Newhaven (accepted)	£475
---------------------------------	------

SEAFOORD.—For the erection of a country doctor's house, Broad-street, Seaford, Sussex, for Dr. W. P. Morgan. Mr. Wm. Cooper, M.S.A., architect, 21, Havelock-road, Hastings:—

J. Simmonds & Co.	£2,900 0	C. Morling, Seaford	£1,953 10
Hastings	2,200 0	S. H. Berry, Seaford	1,940 0
F. Crutenden, St. Leonard's	2,200 0		

SHOTTON.—For new Railway Hotel, Shotton, Flint, for the Kelabert Brewery Company, Limited. Messrs. J. H. Davies and Sons, architects, Newgate-street, Chester. Quantities by architects:—

J. Lloyd	£2,798	W. S. Wood and Co.	£2,466
M. Rogers	2,759	T. J. Reney, Connah's Quay*	2,433
J. Mayers	2,695		
W. Peel	2,644		

SILVERHILL (St. Leonards).—Proposed new shop and alterations to Sonnenberg, Silverhill, St. Leonards, Sussex, for Mr. R. L. Davies. Mr. Wm. Cooper, M.S.A., architect, 21, Havelock-road, Hastings:—

F. G. Hutton, St. Leonards	£245
Vigor and Co., Hastings	320
A. H. White, St. Leonards	316
J. Simmonds and Co., Hastings	315
Tapner and Woodman, Hastings	238
E. Guttzell, St. Leonards	226
J. Crutenden, St. Leonards	203
Chapman and Cuff, St. Leonards	257

SOUTHWATER (Sussex).—Accepted for cottage residence (exclusive of stabling). Mr. James Neale, architect, 10, Bloomsbury-square, London, W.C.:—

Ladstone, London	£958
------------------	------

SWINDON.—For the construction of brick sewer, &c., for the Old Swindon Urban District Council. Messrs. Shopland and Redman, engineers, Newport-street, Swindon:—

W. L. Meredith	£1,612	W. H. Smith and Son	£700
B. Winchcombe	730		

TRURO.—For the erection of malting, Walsingham-place, for Messrs. Mallet and Co. Mr. Wm. Swift, architect, 23 Lemon-street, Truro:—

H. Tippet	£706	J. and C. Harris	£659
Dyer and Tippet	735	R. H. Tonkin, Tregony*	450

WOLVERHAMPTON.—For alterations and additions to the North Wolverhampton Working Men's Club. Mr. J. Mason, architect, 80, Darlington-street, Wolverhampton:—

Benjamin Guest (accepted)	£288
---------------------------	------

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney-pot.

Surveying and Sanitary SUPPLEMENT.

DECEMBER 8TH, 1897.

PLANE TABLE SURVEYING.

By G. A. T. MIDDLETON, A.R.I.B.A.

A PLANE Table is an instrument which is not known amongst English surveyors to anything like the extent that it should be, serving, as it does, the purpose of a rough and simple theodolite for preliminary work, and where very great exactitude is not necessary. It consists in itself of nothing more than a small drawing-board, with rollers at either end upon which a roll of paper can be wound, and with an arrangement for a tripod head; and for many purposes an ordinary small drawing-board will serve perfectly well. There are, besides, two loose parts: a box compass and a sight vane. In case of an emergency, any small pocket compass will suffice, but the box form has some slight advantage; while an ordinary boxwood scale, with a couple of needles erected at the centre of either end, will serve the purpose of the sight vane.

The instrument is mostly used for exploration work, preliminary to a more detailed survey, and the plotting is generally done to quite a small scale. It will be noticed that those shown on the illustration of sight vane are of 4 in. and 6 in. to a mile.

A sketch is given of an assumed preliminary survey, made on the table and plotted direct without any preliminary booking. The table is erected over Station 1 so as not to move horizontally, and a point chosen to represent Station 1, this being marked by a fine needle or pin. The compass is now placed at one corner, and moved about until its marked end comes to rest opposite the centre of the box, showing that the magnetic meridian is in the direction indicated by the arrow. A pencil line is then run round the box, and this point marked as shown on the sketch. The sight vane is next placed upon the table with one of its edges against the needle, representing Station 1, and a sight is taken to some prominent object which it is intended to use as Station 2. As the edge of the sight vane rests against the needle, a line drawn along this edge will represent the direction from Station 1 to Station 2, and this is drawn indefinitely; similar sights being then taken and similar lines being drawn to prominent objects which it is intended to locate, such as trees on the banks of river numbered 4 and 6, and some other mark on the top of a hill numbered 5, these lines being shown dotted on sketch.

The distance from Station 1 to Station 2 is next carefully measured, and, if necessary, this

should be done two or three times, as upon its accuracy depends all the subsequent work. This length is scaled upon the drawing, and the needle, removed from point 1, is now inserted upon point 2. The plane table is again erected at Station 2, the compass placed exactly over the square which it previously occupied, and the table revolved until the same meridian is taken. Then, on taking a sight with the edge of the vane against the needle on point 2 and looking back to Station 1, the edge should be found to coincide with the line already drawn. This being the case, fresh sights can be taken to points 4, 6, and 5, and, lines being drawn, the representations of these points are fixed to scale on the plan at the intersections with dotted lines from Station 1. It will be

line 2—3, and so fix Station 3. The needle can then be placed at point 3, which has thus been found, and a sight can be taken to 7, fixing its position as previous points were fixed.

It will be perfectly obvious that the survey can be continued in this manner to any extent, and it is well on a large survey to ink in each day's work as it is completed, and to keep duplicate copies by means of tracing paper, these being carried by different members of the surveying party, so that if one copy be lost or torn there is the other to depend upon.

Another use for the plane table is that of determining the position of windows or other objects on the ground of a neighbour, with whom one is not quite on friendly terms, in order, for instance, to secure evidence in case

noticed that the lines drawn from Station 2 are shown as dot, stroke, and cross.

With so many points fixed, it is now easy to continue the survey without further measurements. The distance from 2 to 3 can be traversed by any circuitous route, the instrument set up—at the end of a day's march—at the camping place represented as Station 3, the compass again brought into position and made to take its meridian, the needle placed in point 2 and a sight taken to Station 2 with the edge of vane against the needle, the line 2—3 being drawn indefinitely. Assuming that Station 5 can also be seen from the camp, the needle is then inserted over point 5, when, line 5—3 being drawn, it will be found to cut

of disputed right of light. An example is shown of some windows. The distance from A to B on the servient owner's premises could be accurately measured, and sights could be taken from A (shown in broken strokes) and from B (shown in dot and stroke), the parallel lines being ruled on the plane table, when all the positions of the windows belonging to the dominant owner are at once determined to scale with very little trouble.

The work is not so accurate as would be that of a theodolite, but the instrument is much cheaper, can be extemporised by anyone possessed of a drawing-board, a scale, compass, and some needles, and the result is quite sufficiently near to truth to serve most purposes.

Preliminary Survey

DRAINING NORWICH.

IT is practically beyond doubt that the City Engineer's estimate of £152,000, for the work included in the Norwich main drainage scheme, will not be exceeded. But, as was made clear in May last, this sum of £152,000 will not include the extensions of the scheme which will be forced upon the city from time to time, as the city grows in various directions, and which were not included in the original scheme. It is expected that the whole of the works will be in complete operation within two years, but long before that period the bulk of them will be in use. As soon as the power station at New Mills is so far completed as to be capable of delivering air under pressure the whole of the ejectors will be brought into use. This is expected to occur before Christmas. The necessity for finishing sewerage operations in streets through which tramways are to be laid is being kept in view, and with this object Magdalen Street will be the next important street to be taken in hand. In May last

A VERY DIFFICULT PIECE OF WORK

was in progress at Carrow Bridge, where the river had to be crossed. This enterprise has been successfully completed at a probable cost of at least from £500 to £1000 less than if the river had been dammed, to say nothing of the avoidance of the great inconvenience to the traffic on the river if this latter course had been adopted. The work referred to consisted of the construction of a 12in. iron sealed main, a 7in. iron gravitating sewer, and a 3in. steel air main across the river at Carrow Bridge, such construction having to be undertaken without interfering with the navigation of the river. The work was accomplished by advantage being taken of the old 30in. cast-iron pipe laid across the river at this point some thirty years since, when the old low level sewerage system was constructed. Of course, this 30in. pipe was much too small to permit of men working within it whilst laying the new pipes, and the method adopted for laying these pipes was as follows:—Specially designed flexible joints were provided to the pipes. Shafts were sunk at both sides of the river, giving access to the old 30in. cast-iron pipe, one of the shafts being long enough to admit of a length of the new pipes being lowered and jointed. A length of the 12in., of the 7in., and of the 3in. pipes were lowered into

THE BOTTOM OF THE SHAFT,

and arranged in the form of a faggot. Chains were then laid which led across beneath the river to a winch fixed in the bottom of the shaft on the opposite side of the river, and by hauling at this chain the first lengths of pipe were drawn into the old 30in. pipe. Other lengths of pipe were then attached. Before

making the joints, the haulage chain was slacked off, and drawn back through the additional lengths of pipe and secured to a proper attachment. The joints were then made and the process of hauling completed, and so on, until the pipes formed complete tubes across the whole of the river. It was found that this old 30in. pipe was not straight, but that it occupied a reverse groove, somewhat like a flat letter "S." This, of course, increased the difficulties of drawing in the new pipes, but the specially designed joints enabled the new pipes to accommodate themselves to all the irregularities. The collecting manhole has been proceeded with in Carrow Hill, near the main entrance to Messrs. Colman's works, and connections have been established between it and the ejector chamber. Very great difficulties have been met with in constructing this manhole on account of the immense volumes of water which were encountered, but these difficulties have been successfully coped with. This

work has been carried out by men in the direct employ of the Corporation, under the superintendence of the City Engineer. In the Heigham Street and St. Martin's districts, the contractors, Messrs. Monk and Newell, have made rapid progress. Two sections of the large surface-water sewer, and also of the deep sewage sewer in Heigham Street, have been connected up. On the St. Martin's side the sewage sewer has been laid for a considerable distance under private land between Heigham Watering and the Drayton Road, and also in the Drayton Road itself. Progress has been made with the deep sewage sewer in St. Martin's-at-Oak Street, which provides the outfall for the sewer from Heigham Watering to Drayton Road. The river crossings at City Station have been completed. Messrs. Monk and Newell have had great difficulties to contend with in Heigham Street, due to the narrowness of the street, the bad condition of many of the houses, the instability of much of the ground, the presence of large quantities of water, and of large water and other pipes, and to the large size

and great depths of the sewers they have had to construct. At the New Mills the turbine pits have been completed. Four large cast-iron sluices have been fixed, and the large Stoney sluice is quite complete. The construction of the Stoney sluice is

A DEPARTURE FROM SLUICES

previously constructed. Until the introduction by the late Mr. Stoney of the design which bears his name, it was impossible without the aid of powerful machinery to operate large sluices; in fact, very large sluices were not attempted. The particular feature of the Stoney sluice is that, instead of the metal of the sluice sliding on the metal of the frame, a series of rollers is introduced between the sluice and the frame, with the result that the sluice is carried on roller bearings, which have exactly the same action as ball bearings in a case of this sort, and rolling friction only has to be overcome instead of sliding friction. The water-tight joint between the moving sluice and the fixed frame is provided for by properly formed and planed surfaces at the end of the sluice and at the side of the frame, so arranged that a turned metal bar, hanging in an angle formed by the end of the sluice and inside of the frame, is forced tightly into the angle by pressure of water on the upper side of the sluice, and a practically water-tight joint is thus formed. The joint at the bottom of the sluice is formed by the planed bottom edge of the sluice resting on the planed surface of the sluice frame. The sluice thus constructed, although it is 15ft. long and 6ft. deep, can be operated by one man. The power station building has been erected. The building containing the refuse furnace and boilers and the rail pit attached to it are complete, and Messrs. Horsfall, of Leeds, have erected furnaces and boiler settings. The

LARGE STEEL AIR VESSELS

for the air-compressing plant have been delivered on the site of the works, and the whole of the air-compressing machinery has been completed and examined at the builders' works by the City Engineer. The contract for the final section of the work has been let to Messrs. B. Cook and Co., of Battersea. This final contract includes a large quantity of work in Magdalen and Barrack Streets, &c., districts, and also in Bracondale and New Lakenham. The river foundations for turbine pits, sluices, bye-pass,

Plane Table Survey for Rights of Light

and new steel bridge at New Mills caused great trouble and delay because of the pervious nature of the river bottom, which was found to be very irregular in its formation, in some cases necessitating the carrying of the work to much greater depths than the boreholes indicated. In the construction of the rail pit connected with the refuse furnaces the large brick chimney, which has formed a landmark at the New Mills for many years, had to be underpinned in bad ground for a depth of about 10ft. to 12ft. Mr. Millet has represented Messrs. B. Cook and Co. in carrying out their contract.

A PARAGRAPH in Truth calls public attention to a fact in connection with sanitation which has not been sufficiently recognised in many country districts, and to which we have more than once referred. It is that the cesspool method of drainage, when properly carried out, presents less danger to health than a faulty sewerage on the pipe system. Many towns and villages have got rid of their cesspools, and laid down drain pipes too small for their work, or badly arranged as regards outfall, and the result has been outbreaks of typhoid and scarlet fever. 'Truth' points out, as a curious coincidence, that Maidstone, with a pipe sewerage, has suffered heavily from typhoid, while Rochester, only a few miles off, and drained by means of cesspools, has remained free from the epidemic. It is remarked, however, that Rochester employs a novel vacuum apparatus constructed by Messrs. Merryweather, the fire-engine makers, to empty the cesspools without causing a nuisance; and this fact may have something to do with the matter, as the old plan of employing carts has most objectionable features, and has gone far to discredit the cesspool system with local authorities. It might be well for country places proposing to abandon their cesspool systems to give this matter careful consideration before coming to a decision.

Surveying and Sanitary Notes.

The fact that pigments containing arsenic are dangerous to the health is too widely known to require special mention. It has been especially found that arsenical wall paper, hung in damp rooms, has frequently caused chronic cases of poisoning to the occupants. There are two contrasting opinions as to the way this arsenic poisoning comes about.

through the influence upon the arsenical substances of the paper of organisms which appear when the organic binding agents, such as paste, &c., used for attaching the paper, become mouldy. To solve this question extensive researches have been made for the first time by Emmerling in the laboratory of the Berlin University, the results of which seem to confirm the correctness of the first-mentioned opinion. It was shown that cultures of various bacteria, as well as several mould fungi, were not able to develop any trace of arseniuretted hydrogen from arsenical sub-

Some think that the dust which becomes separated from the paper through wiping or concussion, as well as expansion and contraction, caused by changes in the temperature, is scattered about and enters the lungs of the occupants, thus giving rise to poisoning. According to the views of others, the health of the occupants of rooms provided with such arsenical wall paper is injured by arseniuretted hydrogen gas—assuming that this is formed

strates. Nor did this gas form when paper with paste and Schweinfurth's green, which is known to be highly arsenical, was exposed to moisture and became covered with an abundance of large mould fungi. It may be assumed, therefore, that the first-mentioned opinion, which assigns the cause of the appearance of cases of chronic poisoning to the pulverisation of the coating of the wall paper, is the correct one.

IN MEMORIAM.

MR. JOHN L. PEARSON, R.A.

It is little more than twelve months ago since we had, editorially, the opportunity of enlisting Mr. John Loughborough Pearson's own interest and assistance in regard to a monograph upon his work, designed for the pages of our contemporary publication, *The Architectural Review*. Mr. Pearson's virile and prolonged architectural career then seemed in no wise ending; his eyes were as bright and keen as in the earlier years, when he himself was enthusiastic in the ecclesiastical architectural revival in which he played, for more than half a century, so significant a part. His short, stalwart figure was full of the active lines of fine old age, and his intellect was as interested and as sensitive as ever to the architectural problems and possibilities of the day. Underneath the artistic austerity of the man there was a genial kindness and heartiness which, in many ways, is indigenous to those northern counties from one of which he came. The career of Mr. Pearson and the career of the Gothic Revival may have been said to synchronize, and it would be impossible for the architect and the archaeologist of the future to consider the English work of the nineteenth century without considering at the same time that gift for design which so well earned the Academic title of which Mr. Pearson was justifiably proud. The son of Mr. William Pearson, a water-colour painter, John Loughborough Pearson was born at Brussels in 1817. He commenced his professional career at the age of fourteen, when he entered the office of Ignatius Bonomi, architect of Durham, afterwards coming to London, where he was first with Salvin, and later with Phillip Hardwick, R.A. Mr. Pearson's own private practice began in 1843, in which year it may be noted he was engaged upon the drawings of Lincoln's Inn, a building which has been considered to be one of the landmarks in the history of the Gothic revival, and which was built by Hardwick. Mr. Pearson was appointed architect to Lincoln Cathedral in 1870, and latterly had under his care many of our ancient cathedrals and churches. He was elected a Fellow of the Society of Antiquaries in 1853, a Fellow of the Royal Institute of British Architects in 1860, an Associate of the Royal Academy of Arts on January 29th, 1874; and attained the highest of all honours to an architect, that of Royal Academician, on November 27th, 1880. He obtained a gold medal at the Paris Exhibition of 1878, and was made a Knight of the Legion of Honour on November 15th in the same year. Although latterly, Mr. Pearson was never to be seen at the meetings of the Royal Institute of British Architects, he was at one time a member of the Council, and the Royal Gold Medal of the Society, the annual gift of Her Majesty the Queen, was awarded to him in 1880. For many years he acted as one of the consulting architects to the Incorporated Church Building Society, an honorary appointment which must often have been somewhat arduous. He has always resided

In our notice of Mr. Pearson's work, we give extracts—through the courtesy of the Editor—from an article which appeared in early numbers of *The Architectural Review*.

P P 2

in London. He started practice in Keppel Street, Bloomsbury, moving thence to Delahay Street, Westminster, and Harley Street, Cavendish Square. His offices and residence, at the time of his death, are in Mansfield Street, Portland Place. Mr. Pearson at once identified himself with what has been called the Gothic revival, and as early as 1843-4 we find him engaged in the erection and restoration of various village churches in Yorkshire. A careful and conscientious student of old Ecclesiastical Architecture, his early works bear rather the impress of his surroundings than of that vigorous and sometimes daring individuality which is displayed in his more mature efforts. The most important work of this date is, perhaps, the new church of North Ferriby, erected, with its tower and spire complete, in 1846; it is, for its date, a remarkably good specimen of the kind of church which was afterwards more fully developed in St. James', Weybridge, and Holy Trinity, Westminster. The latter, Mr. Pearson's first London church, was begun in 1850. Eight or ten years had elapsed, and in this interval the study of the Mediæval Architecture of France, fostered by the influence and example of the late Sir Gilbert Scott, was exerting a modifying influence on the Architecture of England. St. Peter's, Vauxhall, exhibits very marked traces of this influence. A somewhat unusual feature in the designs of that time was the apsidal termination of the chancel, a common enough treatment in France, but one which never seems to have found favour in Mediæval England. Instances of its adoption show an obvious foreign influence, as at Westminster, Peterborough, Norwich, and the fine Abbey Church of Muchelney, Somerset, the plan of which now exists only up to the ground level. With these exceptions and a very few village churches of limited dimensions, the square end may be said to be almost universal. The lapse of another eight or ten years brings us to the date of St. Augustine's, Kilburn, a church of much larger proportions than either of those already alluded to. The east end, which is here square, with its bold triplets in two tiers, and the west end, with its double arcades and great rose window over, are particularly effective. The Church of St. John the Evangelist, Red Lion Square, followed in 1874, and is a fine example of how an awkwardly shaped site may be turned to the best advantage. This is a very beautiful example of the purest Early English work, and its detail is well worthy of careful study. Soon after the date of this church came Mr. Pearson's most important work, Truro, the only English cathedral consecrated since St. Paul's, London. In point of size, Truro does not compete with the great French churches, nor with the largest of our English cathedrals, but it may be classed, when finished, with such buildings as Rochester, Wells, and Lichfield. The massed effect of the cathedral, even in its incompleteness, is impressive by reason of its sincerity, solidarity, and repose. There is a foreign air in the clustering familiarity of the quaint old Cornish city, but on the north side you are enabled to perceive at once the strength and the simplicity of Mr. Pearson's scheme. No doubt, as the years bring what will be the inevitable completion, the significance of Mr. Pearson's treatment of a great opportunity will become more and more apparent. There is enough, already, to justify, indeed to emphasise, this view, for we must remember that no severer test can be applied to the Art of a man than that involved in the partial dismemberment of a completed scheme. So much was at stake, and so much, alas, had to be left. But few look upon Truro Cathedral without feeling that Mr. Pearson's work is a credit to a century which has seen at once the revival and the partial eclipse of Gothic

style. Among other important churches which Mr. Pearson has carried out may be mentioned Wentworth Church, Yorkshire—a good specimen of "Geometrical Gothic"; All Saints, Hove; the Cemetery Chapel, Malta; the Catholic Apostolic Church, Maida Hill—Mr. Pearson's most recent London church. These are only some of his largest churches. There are numerous small ones scattered about England, of which Titsey Church, Surrey; St. Peter's, Laverstoke, Wilts.; and Norley Church, Cheshire, might be cited as examples. Lincoln should head the list of cathedrals, as it was the first entrusted to Mr. Pearson's care. Here, as in all Mr. Pearson's restorations, every ancient stone was numbered, and replaced in its original position. At Bristol, Mr. Pearson's work consists mainly of the completion of the two western towers from Mr. Street's designs, the restoration of the fine Early English Lady chapel, and the north transept window. The beautiful Norman west front of Rochester Cathedral has been most carefully repaired under Mr. Pearson's direction, and the turrets completed. At Exeter Cathedral, Mr. Pearson's principal works consist of rebuilding a portion of the cloister, and forming a chapter library over. In London, the restorations of Westminster Abbey and Westminster Hall are well known. The principal work at the Abbey has consisted in completing the upper part of the great north transept, the three porches only having been taken in hand by Sir Gilbert Scott. Mr. Pearson's domestic work, considered chronologically, should begin with the mention of Treberfydd, in Wales, a good-sized country house, somewhat after the manner of Haddon Hall or Compton Wynyates, built in 1848. Following this was Quarwood, in Gloucestershire, a Gothic house with traceried windows, steeply-pitched roofs, and many turrets. Roundwick, in Sussex, begun as a farmhouse, grew to be much larger, and is a picturesque building of stone, brick, and half-timber work. Westwood House, Sydenham, is not a new building, but has been completely remodelled and extensively added to. The style adopted is that used in old French chateaux, and is, we believe, the only example of Mr. Pearson's work in this manner. At Cambridge, Mr. Pearson's domestic work may be advantageously studied, as he has made extensive additions to Sidney Sussex College, Emmanuel College, and the University Library. The office building on the Embankment for the Honourable W. W. Astor is a very important secular work. Some of the late Mr. Pearson's more important works have now been briefly referred to, in all of which there is an individuality present that enables one who is conversant with his methods to recognise his hand. To describe this quality is most difficult, but, broadly speaking, we should say in all his works a chief characteristic is simplicity of form and outline, great care being always taken not to interfere with it by inappropriate or coarse detail. This is particularly noticeable in his treatment of spires and turrets, where the outline is considered from every point of view. Another attribute of Mr. Pearson's buildings is what must be described as the absence of hardness. The detail of Mr. Pearson's stonework is always interesting to study, as there is so much variety in it; and in the art of vaulting he was unsurpassed. However difficult may be the problem or intricate the plan, the result was always pleasing. Our special Truro correspondent writes:—"The solemn strains of the Dead March in Saul echoed an eloquent tribute throughout the beautiful Cathedral Church of Truro after the morning service on Sunday last, to the memory of its revered and honoured architect, J. L. Pearson, R.A., whose worth and loss found dignified and touching expression from the pulpit."

H.M.S. ROYAL CHARTER:

OR,

THE NEW HAND AT THE PUMP.

[Incorporated in the seventh year of William IV., and the fiftieth of Victoria; dined in the sixty-first Victoria.]

"LOCKES, BOLTES AND BARRES SOON FLIE ASUNDRE."—YE WOLFE [IN YE FOIDE].

Ancient Ballad said to have been sung at the Festival Dinner of the Royal Institute of British Architects, in commemoration of the Sixtieth Anniversary of Her Majesty's Accession and the incorporation of the Institute, held in the Banqueting Hall, Whitehall Rooms, Hôtel Métropole. — Vide Wren's Times.

When it came to heaving the double lead [Editorial note] of the wicked and nautical Royal Charter [in 5 degrees longitude, 0000 latitude, Conduits Straits, R.I.—B.A. Cantab], a calm fell on the assembled host of Captains of Industries—all wafted to the same Port ('47) by the self-same gust of the Prevailing Trade (Wind). Each equipped with stores of archaic Gestes, Elgin friezes and antique quibbles lately disinterred from the buried Times, all eyes turned to the central seat, where set-square to all the winds of heaven the Post-Captain sat: Warmed by the flame of many concentrated eyes he expanded: "Gentlemen, I give you the good ship Royal Charter! Though it lie in the Roads of Fame, may it never be more in the way than it is now! Standing as I do to-night on the shore of this sea of foam-white napery, girt by a glorious champaign of famous faces with black breakers in the background, the nautical simile seems to me a good one, for are not we, too, *going down*?—to Posterity I mean; and is not our work done?—for the day—of course, as was theirs who sank as we beneath the waves of popular esteem. I need not trouble my learned captains with my ideas on the development of Gothic from the early-pointed prow of the Ionic bargeboard. I would rather say somewhat of the battlefield of to-day, whereon rages as ever the eternal conflict of past and future, the unappeasable strife of styles, which, in whatever style of strife it be conducted, must engage each one of us fore and aft. Gentlemen, let us like that other noble Charter, go on sinking—our differences! May it ever be said of us that, whatever we did in our lives, we dined true to our country and our principals. Let us never abandon our age. It shall never be said of us that we were designing men, for are not our thoughts governed by presidents? Let us cling

to those most cherished possessions, to those apples of our eyes—our pupils—that so we may be *boyed* over the troublous waves of time. Gentlemen, though we have fasted these many years, at length we feast; but who shall keep the watch of our future feasts? Need I say that we have here one whose chiselled sentences, whose architectural periods, and, may I add, whose periods of Architecture are world-renowned, adjectives flow—forgive me if I cannot stay them—glittering, brilliant, evanescent as the Bulle d'Air in the magnum before him. I hear murmurs—Mumm's the word, why should we Heid-seick quarrels. Now let our Nientenant speak!"—And the Nientenant said: "Gentlemen, as Commander of the H.M.S. Bulle d'Air (as our Post-Captain humorously calls me) I am deeply sensible of the honour conferred. I am, in fact, so over-bubbling with gratitude that I can say no more. I will only, with a certain amount of address, paraphrase the address of our Post-Captain and that of our Naval Institute, and say "May we all go down the Conduit Straight into the sure hope of everlasting fame."—Then the Commission repaired to the hold!

MR. JOHN RUSKIN

AND

"THE ARCHITECTURAL REVIEW
ART ANNUAL."

IT will be known to the readers of THE BUILDERS' JOURNAL that the Christmas Double Number of The Architectural Review contains the reproduction of an exquisite drawing by Mr. John Ruskin, entitled "Budding Sycamore, Sketched at Greta Bridge." The drawing has been much admired, and bears Mr. John Ruskin's own autograph. The following letter has been received:—

"Brantwood,

"Coniston Lake.

"DEAR SIR,

"I gave The Architectural Review Art Annual to Mr. Ruskin, who desires me to thank you very much. He has looked through it all with great interest and pleasure, and says he considers the reproduction of his own drawing quite admirably done."

The letter is signed "Joan Ruskin Severn."

It will be of further interest to readers to know that Mr. Ruskin has placed a considerable number of drawings, never before published or reproduced, at the disposal of the Editor of The Architectural Review, and that many of these drawings are illustrative of Venice.

MODERN ARCHITECTURAL
PROBLEMS.*

AS ILLUSTRATED BY SOME EDINBURGH BUILDINGS.

BY PROFESSOR G. BALDWIN BROWN.

(Continued from page 382.)

THE difficulty in the way of adopting this solution of the problem of a modern style resides in the fact that the artistic treatment of the necessary features of the wall, with its plinth and cornice, broken up in accordance with internal divisions and pierced with openings, has not in practice been found sufficient by designers who have used the style. Additions were soon made by the Tuscan architects to this simple scheme, and the shafts and pilasters and pediments of the old Classical Architecture of the colonnade came to be used to divide up and enrich the elevation. This practice has become habitual, but there are plenty of examples to show that neither for monumental grandeur nor for beauty is it a necessary practice. These external features, not provided by use and construction, are employed very sparingly in the work of Adam and Playfair already referred to, though in other structures of the time of the latter architect they were much more abundant. Playfair's own colonnade round the Royal Institution in Princess Street is exceptional in his work, and is by no means a happy device.

A NEW BREATH OF CLASSICISM.

There was, indeed, a new breath of Classicism breathed into the traditional Renaissance style of the eighteenth century owing to the influence of the discovery of Herculaneum and Pompeii, and this Classicism was, as we have seen, carried to extremes in work like the Edinburgh High School, which may be appropriately called "Neo Classic." The buildings referred to above do not, however, as a rule use the colonnade except in connection with the portico in front of a doorway, where it may be said to have a natural significance. A projecting roof, in porch-form, in front of a door at which people may presumably have at times to wait, is in our northern climes motivated by considerations of climate. Such a porch needs supports on the exterior, and these naturally take the form (combining strength and convenience) of round posts. Why need these round posts assume the shape of the old classical column? may be asked by the modern practitioner, and the answer, though it may not satisfy some modern aspirants, has yet some solid basis in common sense. Traditional features have, as we have already seen, a certain advantage in themselves over novelties, but there is this also to be said for them, that the classical columns are singularly perfect both in beauty of outline and proportions, and in the expressiveness of their forms as conveying the idea of their position and functions. If any modern designer can produce shapes more graceful and more fitted to their purpose we shall have nothing but praise for him. In the meantime, when, in a building of the character under consideration, columns are motivated by the need for a porch, there is nothing forced or artificial in the use of the familiar and beautiful Grecian shafts. It would be hard, however, to persuade the architectural community as a whole that this Renaissance style, though prized, as we have seen, in the modern world of the West for its own use and convenience, has for to-day any more validity than a dozen other styles that the various "revivals" of the century have brought successively into vogue.

(To be continued).

* Extracts from an address delivered before the Edinburgh Architectural Society on December 1st.

HALF TIMBER WORK.

BY W. A. MELLON.

A PART from its scarcity or the difficulty of quarrying stone, and the non-existence in mediæval times of brick, it may be assumed that the preference for timber as a building material was a taste inherited from a very early age, when the primitive log hut satisfied the wants of a rude and warlike people, bent constantly on conquest, and with but little thought for the development of the luxuries and refinements of a home, and when, in short, it must practically have been the only available building material—well adapted, however, to the requirements of the times. Though supplied in abundance by the vast pine forests of Northern Europe, the woods of England could not long withstand the drain upon them occasioned by the wasteful method originally introduced by the northern conquerors, and the foundation of the style as now known

its sole inspiration a desire to out-do all competitors—past, present, or future.

This system of "post and pan" houses, as they were called, obtained all over England, as well as France, Germany, and Belgium, during the Middle Ages. London was built in this way until destroyed in greater part by the Great Fire. From the fact, however, that in that town all, from highest to lowest, were bound by law to whitewash their houses once a year, it may be assumed that the constructive timbers of the houses were not usually exposed, but were plastered all over. This is a treatment common to many countries, and of which any old English or Scotch town usually possessed many admirable examples. In point of beauty it perhaps does not fall far short of the phase more particularly dealt with herein, and while from their extreme simplicity these houses may sometimes be passed over in favour of the more elaborate examples, they yet present many studies of good proportion and picturesque grouping of parts which are perhaps the qualities most

although the use of Gothic detail gives many of them at first sight an earlier appearance, the earliest are probably of the time of Henry VII.

While the development of the style in its simpler and earlier stages is to some extent matter of conjecture, a review of its progress may now be taken up with a little more certainty based upon observation of known examples. In the older examples the timbers are massive baulks placed so near together that there is quite as much post as panel. As time went on, however, timber became still more scarce, and the main pieces were placed further apart and the panels enlarged. About the latter part of the sixteenth century ornamental quartering was introduced in the better examples. For this purpose naturally curved pieces and the angular parts of crooked boughs, which enter so largely into the composition of oak trees, were selected and cut down the middle, and the two sections were halved into the smaller timbers and framed into the principals, matching one another.

MORETON OLD HALL. FROM A PHOTOGRAPH.

was no doubt primarily due to the desire for a more economical treatment of the material. The logs were hewn up, each yielding several square posts, which, when fitted together, formed the skeleton framework of the structure. The spaces or panels so formed were then lathed with hazel wands, or other ground-work, to receive a solid infilling of plaster composed of clay and straw; or sometimes two such panels were formed with an air space between, which was doubtless found to be to some extent more efficient as a non-conductor of heat and damp. Latterly the exposed framework, for its better preservation, received a coat of paint—the colour selected in this country being usually black—and the plaster panels were whitewashed, offering a very cheery contrast. From this modest beginning has been handed down, for the study and emulation of present day architects, a fully developed and picturesque style of domestic work, emphasising the oft-repeated lesson that any branch of Art developed truthfully and naturally must necessarily rise superior to that taken up at the dictate of a passing fashion, and too often having for

conspicuously absent in the greater part of modern work. In this respect the study of traditionally high buildings, as those of Edinburgh, is perhaps not so profitable as that of the cottages in the South of England. In these latter may be seen more especially the charming effect derived from the skilful arrangement of roofs, which in small buildings must be an all-important feature.

About the fourteenth century the great woods of the South and West of England were being cleared, and the building material thus liberally provided was taken full advantage of by the increasing population, and as a natural consequence it is found that where the forest was thickest there the houses of timber construction most abounded. Very few of the examples existing in England at the present time date back to the fifteenth century, and it is extremely improbable that any are of earlier date. Even those that do remain have been repeatedly repaired or added to, the ornamental parts being probably changed to some extent also to suit the taste of the period. The great majority of existing examples are of the time of Elizabeth and James I., and,

This material would have been practically useless for any really constructive purpose, and the natural curvature of the pieces bore great artistic value as a contrast to the main rectangular framings. In common buildings, and at a later date, straight braces were often employed in place of curved, but never with such a pleasing effect. The plaster panels were sometimes stamped or modelled into patterns or painted in colours. In some later instances, after the revival of brickmaking, plaster was altogether dispensed with, and the spaces were filled in with brickwork set in herring-bone fashion; and when the grey oak was left unpainted the effect was very harmonious. The system of brick infilling does not, however, equal the other so far as waterproof qualities are concerned, and the usual black and white, commoner in the north of England, was in this and other respects the more efficient.

There is an important, though not invariable, feature which is strongly characteristic of ancient timber buildings—namely, the overhanging to a greater or less extent of the upper stories over the lower. This practice

DERBY HOUSE, WATER GATE, CHESTER. SKETCHED BY J. HUTCHINGS.

may have originated in walled towns, which places, yearly increasing in prosperity, became less able as time went on to accommodate the increasing number of inhabitants. Every foot of space became daily more valuable, and every contrivance was used in order to gain as much internal room as possible. This may also have been a reason for the continued erection of timber houses in towns in a more peaceful age, as, by the thinness of their walls and the successive projections of the upper stories beyond the line of the ground floor, much space was gained, such houses being much more capacious than those built of brick or stone could possibly have been. Another equally strong reason for the practice was the protection of the fronts from the weather, every precaution having to be taken for their preservation, carved timber and even plain timber, when used in conjunction with plaster, being somewhat susceptible to damp. It also incidentally afforded a shelter to the streets of warmer climes from the rays of the midday sun. The roofs in towns were commonly reared in high and narrow ridges with their ends set towards the street, and over the top-most story of the house rose the high-pitched gable with barge-board and finial.

The leading features of a normal house of this type are then briefly these. The lower story of the house was sometimes of stone, partly sunk, in which case it was almost invariably vaulted over. These lower apartments, or crypts, of which several examples may be seen at Chester at the present day, probably served as store-rooms for valuable goods, or merely as cellars according to circumstances. In other cases this story was of timber, and the superstructure was almost in every instance of timber, it being only amongst the most wealthy class that the upper stories

were of more durable material. Country mansions and some town houses of more than usual pretensions usually possessed a large central hall or banqueting room. The roofs of these halls were commonly of massive open timber work, often richly ornamented, and during the reign of Elizabeth rich oak wall panelling was introduced. In the reign of Elizabeth was also first introduced in the better class houses a long gallery for music and dancing—probably the first dawn of the modern drawing room—which, aided by the affectation of foreign manners at the time of the Restoration, and the ever-widening gulf between master and servant, slowly but surely witnessed the decay of the common hall, a feature in an English home which it may be hoped lies only dormant. On one side of the hall was the parlour, &c., and on the other, the kitchen and offices. In the upper part of the gable of many of the houses—as in the “Bear and Billet” inn at Chester—is found a door or window, the attic room to which it communicated being generally used as a store-room or granary, as evidenced by the remains of hoisting apparatus often found within.

At the beginning of the fifteenth century pure Gothic had been flourishing for two centuries, and it is but natural, therefore, to find the houses of that period treated with Gothic forms and details. The timbers are decorated with all the delicacy of the work of that period, having probably been wrought by the same men, who are responsible for the best work of the Gothic cathedrals. Moulded and carved strings are planted on the framing. Jambs of doors, angle and other uprights have moulded caps and bases, or are treated with richly traceried panels, and the heads of windows are carved and cusped. Of this style in its fullest development, Moreton Hall and

Bramhall Hall, both in Cheshire, may be taken as typical examples. The first thing that strikes the eye in the courtyard of Moreton Hall is the picturesque grouping of the large bay windows, and the masterly way in which the extremely elaborate and irregular work is contrasted and given point to by the comparatively plain gable adjoining, for the men of those days well knew the value of such contrast. Without the plain gable as a set-off, the rich work would lose a great part of its interest. For the same reason the barge-boards are only slightly moulded. The moulded and carved work is very delicate, perhaps even too much so for exterior work, the carved member immediately under the ties in the gables having quite a lace-like appearance. The small panels are treated with simple Gothic forms in a skilful manner, and are specially interesting as showing the treatment of panels as panels, in contra-distinction to the more usual custom of designing the ornament with reference to the inclosing timbers. While the former may be the better method in the case of applied ornament, yet when the ornament, such as simple curved braces, possesses any constructive value, it is better to design it with reference to the main timbers in order that such may be more fully brought out. The glazing of the windows in this house might well form a study in itself of leaded work, so varied are the patterns to which it is wrought.

Barge or verge boards play an important part in half-timber work. They were originally simple boards carried on the projecting plates, purlins and ridges to cover and protect them, as well as the gable wall, and give a better finish to the elevation. They were in course of time finished with an ornamental finial, or drop, and moulded, and in innumerable instances were elaborately carved and pierced, many of the examples being extremely beautiful. These latter, of course, required a simple wall surface as background to give them their full æsthetic value, and when there was much carved work in other parts of the building, were almost indispensable in keeping up the general tone of the design.

In the course of time the Renaissance influence reached England, coming at first in no very seductive form, but little by little ousting Gothic from the field. In England and France the change was very slow, and lasted through the sixteenth century. The new style first made itself felt in the town and more important country houses, but the provinces as a whole were unaffected by the change, and houses continued to be erected in the old traditional style even during the seventeenth century. Fashionable and up-to-date architects are, however, not peculiar to modern times, and those of that period quickly embraced the new style, and in their imperfect knowledge of it, and with no models worthy of the name to guide them, bequeathed to their successors some “wonderful” details, perhaps more calculated to amaze than inspire by their beauty. Their buildings teemed with quaint conceits, grotesquely carved pilasters and consoles, Gothic and classic detail being mixed up in a most incongruous and, to a purist, painful manner. In spite of these peculiarities, however, the Elizabethan architects treated their buildings in such a manly and broad spirit as to atone in their free and bold lines for all their shortcomings in matters of detail; and there is in general a bigness about their work which all the purest detail in the world could not of itself give, nor all the bad detail destroy.

The barge-boards had fallen from their high position, it might almost be said literally, for they as formerly known had totally disappeared. A poor classic enrichment at first took the place of the beautiful Gothic work, and even this gave way to a lean board, slightly moulded, and sometimes bearing a badly-drawn billet ornament as often as not merely scratched on the timber. The consoles show rather a wildness of conception only compensated for in the vigour of their execution. In the modelled plaster panels, however, was made a decided hit, and though the modelling may be a little crude, yet the subjects are very interesting and the general effect very good indeed. Bishop Lloyd’s

Palace and God's Providence House at Chester are very good specimens of this class of work. Modelled plaster was also treated as free ornament, an unusually elaborate specimen of this being found in a cottage at Wyvenhoe, near Colchester, the upper walls of which are entirely covered with scroll work. Italian foliated scroll work was introduced by foreign artists in the first half of the seventeenth century, and no doubt gave the first suggestion of filling in the whole of the triangular part of the gable with a bold design, much favoured by present day English architects.

The "Bear and Billet" inn at Chester shows a characteristically English street front, and one which, with its quaint signboard, has doubtless proved a Godsend to many an artist of the "potboiling" type. The strong horizontal lines and series of panels make a very quaint composition, and the windows extending the whole width of the front on each floor are extremely picturesque. One can have too much light in a room, however, and possibly those long windows were not an unmixed blessing. In consequence of the window-tax many of the kind were wholly or partially closed up. The upper room here was probably the music or dancing gallery.

There is a peculiar development of half-timber in Chester which is said to be unique, namely, the Rows. These are long covered arcades formed by the front portion of the first flat being taken out the whole length of the street and substituted by a flagged pavement, reached from the street level by flights of stone steps at intervals, and with a second row of shops behind. The shops on the street were probably at one time merely cellars, to which purpose some are still appropriated. There are several theories of the origin of the Rows. One is that they were constructed for defence. Aimed from the Rows by the citizens—stones, arrows, and in later times bullets, would be delivered with telling effect upon the heads of the assailants below. In time of peace the stalls, or front-portion of the row between the pillars that support the superstructure, would serve admirably as stations from which the citizens might view the civic processions for which Chester was famous. Let no one, however, be now afraid of promenading the streets of Chester. The excited inhabitant is supplanted on the balcony by the young ladies of the town. The Rows are in fact now the fashionable promenade of the town, and when

the four rows of shops are lit up in the evening, the scene can only be likened to a huge bazaar. Chester is what one might call the home of timber work, and even now a whole street close to the cathedral is being put up on truthful and traditional lines, though probably as much on sentimental as utilitarian grounds. Cheshire and Lancashire are rich in examples of good Elizabethan work, from which Speke Hall, near Liverpool, may be singled out for mention.

While these examples deserve very careful study, there is yet another important class of half-timber work which is of special interest in its direct application to everyday work, namely, those examples which bear but little detail by which to class them as Gothic or Renaissance, but which may be said to be the true representatives of half-timber, which is fundamentally a phase of carpentry. The art of the carpenter is now-a-days considered as something to be covered up and carefully hidden from sight—and, perhaps, in some cases it is better so. Still, an honest piece of carpentry has a vigorous beauty of its own if its lines are skillfully worked out, and needs no embellishment of carving or veneer, which too often destroy the very effect they are intended to emphasize. There are, fortunately, numerous examples of carpentry fronts pure and simple, amongst which may be mentioned Trewern Hall, Montgomeryshire, The Oaks, West Bromwich, the Old Hall, Gainsborough, &c., and a study of one or two of these typical examples may prove interesting and instructive, teaching one what to retain and what to avoid, for these examples have their bad as well as good points.

(To be continued.)

THE French Estimates provide this year for £6900 being spent on the restoration of the exteriors of the Palace of Versailles and the Trianon and £4000 on the fountains in the park.

Two hundred pounds damages have been awarded to a Battersea carpenter, who sued Messrs. Treasure and Sons, builders, of Holloway. While working at the new Board school at The Grove, Wandsworth, the plaintiff fell 42ft. from the scaffold into some water, owing to a plank giving way.

THE PLANNING OF HIGH SCHOOLS FOR GIRLS.*

By J. OSBORNE SMITH, F.R.I.B.A.

(Continued from page 396.)

LAVATORY FITTINGS.—The water should be laid on to the basins and water-closets direct from the high-pressure mains, or from cisterns placed at a considerable height above the lavatories. The diameter of the pipes will depend, of course, upon the size of the lavatory ranges or the number of closets to be served, as well as their position below the main cistern. A very important point to bear in mind is that the closets and lavatory basins are often all in use during the same time, therefore all service pipes must be exceptionally large. There are so many disadvantages connected with the small flushing cisterns which water companies insist upon, that other methods of flushing the closets are arranged when water is supplied through a meter, such as lead-lined trough and spindle valves over water-closets or continuous cistern. The stoneware trough and automatic flushing-tank arrangement for water-closets partially avoids these difficulties; but a separate water-closet apparatus and flushing arrangement has many advantages over the trough method. Ranges of water-closets in or adjoining a building should be invariably separated from the corridor or stairs, which gives access to them, by a well-ventilated lobby or passage, in which may be placed the lavatory basins. These lavatories should be roomy enough to allow pupils to pass freely to and from the water-closets while others are using the basins. The height of the lavatories and water-closets need not exceed 8ft. 6in. or 9ft.; a separate window for each water-closet, inlet ventilators near the floor of the lobbies or lavatories, and outlet flues from the ceiling level up to above the roof are desirable.

WALLS.

Walls must, of course, be built of sufficient substance to resist heat, cold, and moisture. Hollow walls in very exposed situations are useful, in spite of their disadvantages; but solid walls of good materials are better for ordinary positions. All openings in walls, flues, chases, &c., should be made accessible

* This article, the first part of which appeared in our last issue, was read at a paper before the Architectural Association on December 3, 1897.

for cleaning. The greatest care should be taken, and thoroughly effective means should be adopted to prevent moisture penetrating the walls from above downwards, or from the ground upwards. Solid damp-proof courses, formed of asphalt, slate, cement, &c., ought alone to be used, being much more effective than the various glazed perforated substitutes.

ROOFS.

Roofs, if of the usual wood rafters, and slate, tiles, or lead coverings, should be close boarded, and have some non-conducting material under the outer coverings.

FLOORS.

Floors of class-rooms should, if possible, be impermeable, and covered with wood. Where wood joists are used special care should be taken to ensure rigidity, and provide effective means of checking the passage of sound and air through the floors. Floors of all lavatories and science rooms should be solid, with hard, non-absorbent coverings. The use of porous breeze concrete for such floors is not to be commended. Wood floor coverings should be polished, and have skirting fillets of sufficient width to keep the desks from injuring the wall surfaces.

VENTILATION AND WARMING.

The cost of forming and maintaining a system of mechanical ventilation, and the desire for an open fire for the sake of cheerfulness and prompt control, account for the fact that in most of the schools of the kind under consideration the open fireplace has been utilised. If a school building be designed to allow currents of air to sweep entirely across it during the pupils' absence, and each class-room be provided with two 9in. by 9in. or 14in. by 9in. shafts or flues from the floor to above the roof, with inlets to each at floor and ceiling levels, in addition to a large warm-air grate and suitable windows, it is found in practice that reasonably adequate means for warming and ventilating are thus economically obtained. Their effective use depends greatly, of course, upon the mistresses in charge of the rooms, but it is an exception to find a head-mistress who is not keenly alive to the value of the means afforded and familiar with the use of them. Vertical inlet tubes, deep sill fillets to windows and the various valve ventilations, are all useful as aids, when kept clean; but unless air is warmed before it enters a school, the inlets will remain closed during six months of the year when fires are in use. This fact accounts for the popularity of the

VARIOUS VENTILATING GRATES,

some of which can be taken to pieces periodically for cleaning, and work best when doors, windows, and ventilators are closed. The assembly-room, corridors, cloak-rooms, lavatories, laboratory, entrance lobbies, and staircases can be more conveniently warmed by hot-water pipes. It should be possible to raise the temperature in the corridors, cloak-rooms, lavatories, &c., to about 50deg. or 55deg.

during cold weather, for the purpose of preserving a fairly equable temperature inside the building and protecting the sanitary arrangements and water devices from disorganisation by frost. The small pipe medium pressure apparatus is found very useful for warming schools, on account of the small quantity of liquid used, enabling heat to be produced in less time than with larger pipes. These small pipes, moreover, can be used under skylights and in other positions where the larger pipes could not conveniently be placed. The practice of arranging hot-water pipes in channels below the floor of the spaces to be warmed, with open gratings above them, is unnecessary, wasteful, and dangerous, because of the difficulty of keeping the pipes and channels free from foul matter from boots and floors. Inclosing hot-water coils in ornamental casings is objectionable for the same reason. The last word upon

WARMING AND VENTILATING CROWDED ROOMS

has not yet been said; the present methods are not perfect. The air in our streets is polluted in a manner which it is to be hoped will be regarded with amazement in the near future, when thick clouds of unconsumed fuel, foul exhalations from so-called sewer ventilators at the level of the roadway, and the fibrous filth from wood pavements, are no longer allowed to adulterate the precious air, which ought to enter our houses unsullied by such dangerous and unpleasant companions. At present the windows and doors are often closed, and the air refused admittance, because it cannot enter alone. Air in buildings will always require warming in winter, but it need not require washing and filtering as it does now. The problems met with in endowed schools for girls are very similar to those in high schools, and

are solved in much the same way. Endowed school governors are too often not overburdened with funds, the endowments having been usually severely taxed to provide new buildings for the education of the boys before it was thought desirable to make similar provision for girls. In conclusion, I venture to hope the movement for giving increased facilities for secondary education to girls will continue, and that those of us who form part of the lesser half of the population will assist with all our energies in this desirable work, even if it should lead to provision being made for training and encouraging women to study Architecture in the coming new home of this Association.—Mr. Banister F. Fletcher, proposing a vote of thanks to the lecturer, said it was one of the most practical papers they had had for some time. They had been so inundated with technical education, and they had been told so much about how to lay bricks and so on, that it was quite a treat to get a paper on planning, which was of course the basis of architectural design. Mr. Osborne Smith had described to them a class-room in which the desks were five deep. He would like to know how far he was influenced by the rules of the Education Department? He believed there was a rule of the Department to the effect that a class-room should not be more than three deep. If they had a class-room with the desks five deep in front of the teacher it was considered by the Department—and rightly so—that the teacher's voice was necessarily strained. As to

THE QUESTION OF LIGHTING.

of course that at once brought them to a rather important point, as to the type of window they should adopt in dealing with schools for secondary education. They had either got a mullion type, which was in use at such buildings as the Universities of Oxford and Cambridge, or they had the double hung sash treatment, which was in use in the London board schools. He would like to know whether Mr. Smith had any special preference for one or the other, and also whether he could give them any relative cost of the two for giving effective light to schools? It seemed to him that in building secondary education schools the mullion window was more academic, and, providing it gave the necessary light, seemed to be the most preferable. As to the use of

VENTILATING GRATES

in schools, he was in the office of a London architect for some time, where they had one, which he believed was put in by the makers for nothing, but whenever it was not used and was left open, the place was simply covered in soot. Of course they must have grates capable of being thoroughly cleansed if they wanted ventilating grates at all. As to the corridors, it seemed to him there was at present a tendency to make them more attractive. In a 7ft. corridor they could not do much, but if 10ft. they could make it a picture gallery. That would be putting a certain amount of

BUTCHERS' ROW, COVENTRY.

ENGLISH BARGEBOARDS. SKETCHED BY W. A. MELLON.

character in it, which otherwise it would not possess.—Mr. Seth Smith, in seconding the proposition, said in view of projected legislation on the subject of secondary education, they might expect that some of the suggestions put forward by the lecturer would be considerably modified. The answer to Mr. Fletcher's question would be that the Education Department had nothing to do with high schools, but only with

ELEMENTARY SCHOOLS,

whilst the Charity Commissioners dealt with endowed schools. Therefore, the rules of the Department, as to the cubical contents and floor areas, would not apply to high school building, otherwise they would not have Mr. Osborne Smith advocating class-rooms of 12ft. He most thoroughly endorsed Mr. Smith's remarks with regard to the difficulties in the way of adapting old buildings, and, when invited to advise people, one almost always recommended that the buildings should be cleared away, even on the score of cost, because, as they all knew, alterations of this kind involved not only a sacrifice of planning, convenience, and health in every way, but the cost was almost prohibitive. He had had to do with designing several buildings of this kind, and one point he had always felt most strongly about was that he should get the maximum amount of sunlight without inconvenience to the pupils in the class-room by flooding it. He noticed that Mr. Osborne Smith put the desks rather closer than the Education Department allowed for their schools. He did not know that there was any objection to it in a room that was well ventilated, and no doubt it meant a

GREAT SAVING OF EXPENSE,

a weighty consideration in the building of high schools. With regard to the position of fireplaces, he always thought it best to place them between the door and the teacher's desk, otherwise there must be a draught passing between the door and the teacher. There was another objection; when flues went up almost in the external wall heat was lost. He daresay Mr. Smith would tell them there would be less heat by having the fireplace too near the door, but he (the speaker) thought it was important to have it in that position in order to check the draught. He noticed Mr. Smith advocated the use of single desks. Undoubtedly they were best for supervision, but they were the most expensive. He would like to hear Mr. Smith's opinion as to the finishing of the walls internally. He would also like to know if in any of the schools he had erected he had been asked to provide a museum, as he found in many cases it was an acquisition. After referring to the necessity, in planning high schools, of placing the class-rooms in a position to avoid the noise of the street, the speaker observed that he was sorry the Association had refused admission to ladies at present. He was sorry no ladies were there, because the mistresses of these schools would have been able to criticise the plans from experience.—Mr. Howley Sim said the plans shown were chiefly divided between

SCHOOLS WITH CORRIDORS

and those without. It did not appear to be clear how the corridors were lighted. Then with regard to the ventilation of the class-rooms as shown, if they opened the top window and the fanlight above the door it seemed to him there would be a complete draught. With regard to warmth, if dependent entirely upon an open grate, it would require to be lighted some considerable time before the room was used in order to reach a proper temperature. Was it not desirable to have some hot-water pipes? He would also like to ask for information about the dimensions of the assembly hall for three or four hundred children.—Mr. L. Jacob, commenting upon the planning of a class-room, said he did not think five rows of desks were excessive. He objected to the putting of fireplaces between the window and the door, because the pupils would have to walk considerably more in front of them than if they put them between the teacher and window. He certainly thought the arrangement of the plan of

having the class-rooms around the assembly room was rather the best.—Mr. Langton Cole continued the debate. In the event of the gallery being used for the purpose of viewing any function, were any means of exit, he asked, provided

IN CASE OF PANIC,

or were there any special means of exit from the assembly-room.—The President said it was very certain that the question of regulations for the building up of secondary

lavatories connected with the main building, although they might be separated by a lobby. It would be said that there was not the same objections in a school of this kind as in the elementary schools, but he thought the same principles applied. Attention had been called to the aspect of the rooms, and he thought it was very important to get a little sunshine into every room if it were possible. With regard to the position of the fireplace, his experience had been that the right-hand side of the teacher in the angle was the best

Bishops Lloyds House

schools were being taken up seriously. The question of the assembly hall was always a difficult one, especially in a school of the two sexes, and in that case he did not think it possible to arrange a school satisfactorily unless it was on the corridor principle. Where only one sex was to be provided for, he did not think it was a satisfactory arrangement for the class-rooms to be entered directly out of the hall. He supposed the single desk took more room than the dual desks, and, therefore, it affected the area of the room. He was surprised to see Mr. Smith's plan showing the

place. The worst feature of it was, however, that it brought the chimney up in the most unfortunate place in the elevation.—Mr. Osborne Smith, responding to the vote of thanks, said the rule was not to make any special provision for a museum in the corridors. He generally distempered the walls and painted the bottom part with ordinary plaster, sometimes, but not frequently, using a dado. As a rule they did not build music rooms, for the lessons were generally given when other classes were not being held, and a class-room became the music room.

THE GOVERNMENT OFFICES SCHEME.

SECOND REPORT.

THE Committee appointed to consider the question of obtaining sites for the proposed new Government offices have issued their second report. In this they state that "We have thought it well to examine representatives of the Council of the Royal Institute of British Architects, and other qualified members of the Profession, but whilst we have availed ourselves of some of their suggestions, we have felt unable, owing partly to the enormous cost involved, and partly to other considerations, to recommend their schemes generally for acceptance. . . . We are of opinion that the new public offices on the Parliament Street or Great George Street site should be erected mainly

ON THE LINES OF PLAN No. 1

in the appendix to the report of last year, with a frontage in a line with the frontage of the Home Office, and parallel to the east side of Parliament Street; but we recommend that the south-eastern corner of the new building should be square, and not rounded. The land between this new frontage and the present west side of Parliament Street would, if this plan were adopted, become part of the public street; and, in our opinion, there is no need to make special provision for separating the traffic at this point. We recommend the appropriation of this site for the Board of Trade, the Education Department, and the extension of the Local Government Board. As regards the Whitehall site, having considered the alternative schemes for the War Office which have been placed before us this year, we adhere to the recommendation made in our interim report, being satisfied that a building satisfactory in appearance and accommodation can be erected on that site within its present boundary lines; and we are of opinion that the details as to the arrangement of buildings, courts, &c., should be entrusted to the discretion of the Office of Works, in conjunction with the architect selected. We think that a subway should ultimately be formed under the street between the War Office and the Admiralty. Schemes have been submitted to the Committee by the Royal Institute of British Architects and by Colonel Edis for a widening of Charing Cross and of the northern part of Whitehall; but we cannot recommend that the taxpayers should be asked to bear the cost of this metropolitan improvement, which, if undertaken, comes more properly within the duty of the local authorities. We, however, strongly advise that the Mall should be opened into Charing Cross on the north side of Messrs. Drummond's Bank. We think that no decision should be arrived at as to

BUILDING ON THE TRIANGULAR SITE

in Spring Gardens until the houses standing there have been removed, and the ultimate requirements of the Admiralty considered. We recommend that Nos. 11 and 12, Downing Street, occupied respectively as a residence for the Chancellor of the Exchequer, and as an office for the Patronage Secretary to the Treasury, should be removed, as unworthy of the site they occupy; but we are of opinion that the principal block of No. 10, the historic residence of the First Lord of the Treasury, for reasons of practical necessity and on account of its associations, should be retained, the Downing Street front being masked by erecting a new building with a good architectural façade, and the Park front being cased in stone, so as to harmonise with the north and west fronts of the old Treasury Buildings, and the garden ground being inclosed with a screen or railing of handsome design. We do not recommend any further building on this site. We are of opinion that whatever other office accommodation is required, which cannot be conveniently found in existing Government buildings, should be provided for by an extension of the Great George Street site in the direction of Delahay Street and St. James's Park."

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 15th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

The new Town Hall Committee of the Cardiff Corporation have considered the competitive plans for municipal buildings and law courts, to be erected on Cathay's Park at the cost of £200,000. Acting on the advice of Mr. A. Waterhouse, R.A., the committee awarded the first prize of £500 to the plans sent by H. V. Lanchester, J. S. Stewart, and E. A. Richards, Bedford Row, London; the second prize of £300 to J. S. Gibson and S. B. Russell, Gray's Inn Road; and the third prize of £200 to Alfred Cox and A. H. Cooksley, Adam Street, Adelphi. Fifty-six sets were submitted. The site will cost £160,000.

THE surprise of the evening at the annual distribution of prizes to students, at the Royal Academy, which took place on Friday night last, was that the Gold Medal for historical painting, carrying with it a travelling studentship of £200, was not awarded. The subject was "Cleopatra Clandestinely Introduced into the Presence of Caesar," and, as the President said, it was a difficult one. In no fewer than seven other cases the prizes offered were not awarded, and in four there was no competition. Those which were won were as follows: Turner Gold Medal and Scholarship (£50), for landscape painting, Alfred Priest; Creswick Prize (£30), C. M. Q. Orchardson; figure from the life (male students only), silver medals, H. D. Davidson and H. T. Holloway; head from the life, silver medals, A. E. Smith and E. L. Van Someren; draped figure (female students only), silver medal, Hilda Roe; cartoon of a draped figure, silver medal and prize (£25), Mary Towgood; design in monochrome for a figure picture, 2nd (£10), E. E. Ellis; design for the decoration of a portion of a public building, prize £40, Mary E. F. Brickdale; set of six drawings of a figure from the life (male students), 1st prize (£50) and silver medal, O. B. Morgan; 2nd (£25), E. E. Ellis; 3rd (£15), G. Murray; 4th (£10), M. Bernstein, who was disqualified owing to having received a superior prize in the same competition before; drawing of a head from life, silver medals, F. E. Colthurst and E. A. Mott; drawing of a statue or group, silver medal, Mabel Catherine Robinson; composition in sculpture, gold medal and travelling studentship (£200), Alfred Turner; model of a design, 1st prize (£30), E. W. Bayes; set of three models of a figure from the life (male students), 1st prize (£50), and silver medal, Alfred Turner; 2nd (£20), A. B. Pegram; model of a statue or group, 2nd silver medal, M. J. Brown; design in Architecture, gold medal and travelling studentship (£200), A. H. Christie; set of architectural drawings, 1st silver medal, A. M. Watson; set of architectural designs (upper school), prize (£25), G. J. J. Lacy; set of drawings of an architectural design (lower school), prize (£10), J. S. Lee; plan of a building, prize (£10), H. C. Hide; the Landseer Scholarships in painting and sculpture of £40 a year each, tenable for two years, have been awarded—in painting to E. L. Van Someren, in sculpture to Alfred Turner.

SIR E. POYNTEE'S address at the annual prize distribution at the Royal Academy, on Friday night, was almost exclusively devoted to a criticism of the students' work, and to advice to them. He expressed his great regret that it had been found advisable to withhold the gold medal for painting this year, for that was the most widely popular form of Art from the point of view of those who produced it and those who enjoyed it. As to the cause of their failure, no doubt the difficulty of the subject had something to do in accounting for the comparatively poor level of the productions sent in. At the same time he would encourage the student by saying that, having carefully looked at their paintings, he had discovered ample evidence of promise in them, and he was confident that some of those who had competed would achieve success, and probably take a high place in the Art of the country. He warned the students against vulgar realism in Art, and, while he praised technical skill, he would remind them that technical skill was not everything, and, however brilliant, was but a means to an end; that no mastery of technique could ever take the place of the imagination which every true artist must possess. The drawings from a draped figure were the best he had ever seen done in the schools, and he was the more gratified on this account because, while it was comparatively easy to paint drapery, the proper arrangement of drapery was one of the most difficult departments of Art. The President also greatly praised the work done in sculpture; but in the architectural competitions he detected a conspicuous display of that picturesque irregularity which seemed to be the fashion of the day. The address came to an end with the announcement that before long, in those rooms, students and others would have an opportunity of surveying the whole life-work of the late President, Sir J. Millais.

THE fourth of the eight works which have been promised by different donors for the mural decoration of the Royal Exchange has advanced a further stage. The subject for the latest panel is an historical episode, "William the Conqueror granting a charter to the citizens of London," and is by Mr. Seymour Lucas. It is the gift of the Mercers' Company, and the canvas has been successfully stretched on to its frame in the Exchange, preparatory to being placed solidly in its niche in the north-west corner. The picture is not an oil painting in the ordinary acceptance of the word, but a "spirit fresco."

No. 14, ST. JAMES'S SQUARE—the premises of the London Library—which has just been entirely demolished preparatory to re-building, was at one time the town residence of Earl Amherst, when Commander-in-Chief of the British army, and was originally known as Beauchamp House. Since 1840 it has been devoted to its present purposes, while it is also the home of the Institute of Actuaries and other learned bodies. On one side of this famous old mansion is the former residence of the Earl of Lichfield, Postmaster-General in Lord Melbourne's Cabinet, which was the scene of the Lichfield House Compact, whilst on the other is No. 15, once the property of the widow of Sir Philip Francis, by whom it was lent to the unfortunate Queen Caroline.

THE beautiful doorway to Rouen Cathedral, forming as it does part of perhaps the most picturesque frontal in existence, is in so bad a state of repair that the Municipal Council has been forced to depart from its principle not to assist ecclesiastical restorations, and has voted £4000 towards the work, provided it is undertaken at once, and continued without intermission.

"THE Moon of Columbia" is not a natural phenomenon, but an ingenious system of lighting large halls contrived by Professor Halleock. At present, this luminary shines only in the great library of the Columbia University, in New York, where it has proved a great boon to eyes wearied by the glare of incandescent lamps. It consists of a huge ball of wood, 6ft. in diameter, and painted a dead white. Upon

this, when darkness sets in, are projected the rays from eight powerful arc lights carefully concealed in the corners of the four chambers, so that neither the carbons nor the direct beams are visible to the readers. This diffuses a light quite unfatiguing to the eyes, and yet intense enough to enable work to be carried on in any part of the library. To Professor Halleock is due the introduction of this novel contrivance, which is applicable, of course, to almost every kind of public building.

THE committee entrusted with the restoration of Peterborough Cathedral have issued a financial statement for the past twelve months, which includes a balance of £1575 brought into the accounts from 1895. The total available income for the twelve months was £3632, of which amount £231 had been received from visitors to the Cathedral. The expenditure on works during the twelve months, including architect's fees, &c., was £3545, leaving a balance of £87. A further sum of £7500 is still required by the committee in order to complete the works advised by the architect, for the further restoration of the great west front, the north transept, and the eastern chapel.

PROBABLY the recent insistence of the Bavarian Minister of Fine Arts, that the well-known artist Herr von Uhde should alter the features in a picture of Christ, bought by the State, owing to its lack of dignity, may have suggested the idea of an exhibition now being held at Cologne wherein the leading artists have been invited to give their individual ideas of Our Lord's personality. To many it might appear irreverent to start a competition on such a subject, although one may wish for some recognised, if conventional, type of the Divine countenance. However, the Cologne experiment has led to no satisfactory result. A score of eminent painters sent in works, but the critics have come to the conclusion that not one of them deserves entire commendation, whilst the majority are declared to be impossible.

THE Parliamentary Committee of the London County Council report that they have prepared a General Powers Bill for promotion in the next session of Parliament, in which they have included the following matters respecting which references have from time to time been made to them by the Council: Continuation of Roehampton Street, Westminster; widening of York Road (Battersea and Wandsworth); widening of Albert Embankment (Vauxhall); reconstruction of Rosemary branch bridge over the Regent's Canal; acquisition of a site for the purposes of a fire brigade station at Streatham; acquisition of land adjoining Ravenscourt Park and at Putney Bridge Road for open spaces, and provision for contributions by local authorities to such acquisitions; removal of obstruction in streets; extension of time for the purposes of the Vauxhall Bridge Act, 1895, and the Tower Bridge Southern Approach Act, 1895; future maintenance, cleansing, and lighting of the thoroughfares known as Savoy Hill and Savoy Place; exchange of land at South Mill Fields, Hackney; expenditure in connection with the provision and erection of works of art in the county of London; the preservation of buildings and places of historic or architectural interest; collection of money in parks and open spaces; and the application of the provisions of the London County Council Subways Act, 1893, in certain cases.

THE method of improving London by private syndicate is to have a second trial in Westminster. For some years a syndicate had Parliamentary powers to widen Parliament Street, until at last the Government took over the business. Now a syndicate has started business on the other side of Westminster Abbey, and a Bill is proposed for a large improvement between Old Palace Yard and Lambeth Bridge. The area is a kind of remnant of the past, and much requires to be improved, but the County Council has not seen its way to spend the large sum of money which would be required

to buy out the wharf properties and generally develop the scheme. If it were developed, it would pay a handsome return; but whether Parliament will entrust such powers to any speculative hands is entirely another matter. Very shortly, it may be noted, the Council will have to sweep away that ugly and ill-constructed erection called Lambeth Bridge. It was, we believe, a speculative piece of work, and was never a good one. The reconstruction, which will follow after the building of the new bridge at Vauxhall, will involve a great change of level in the road along the river; and if the area west of Victoria Tower is to be "improved," the two operations should certainly be carried out together.

SIR J. WOLFE BARRY, desiring to have some artistic record of his great Tower Bridge undertaking, has commissioned Mr. Wyllie to paint it in oils and Mr. Arthur Severn to draw

THE ninth annual congress of Archaeological Societies in union with the Society of Antiquaries has just been held at Burlington House, London. Resolutions were adopted for forming a catalogue of effigies of all dates in parish churches, and for compiling models for catalogues for museums and for indices of transactions of societies. It was announced that preparations were now made for obtaining, through the various societies, catalogues of family and historical portraits on the forms devised at the request of the congress by Mr. Lionel Cust, the director of the National Portrait Gallery. The formation of a National Photographic Association was also announced. This will, it is hoped, assist the work inaugurated by the congress some years back.

At Windisch, the old Roman colony of Vin-donissa, in the Canton of Argovie, excavations recently carried out under the auspices of the

BEAR AND BILLET INN, CHESTER. DRAWN BY W. A. MELLON.

it in water-colours. He has been happy in his choice; for whilst one can delineate it with all the bustle of the river traffic, the other will endow it with all the dignity of a fine sky and luminous atmosphere.

THE question of the further widening of Fleet Street came up at a recent meeting of the parishioners of St. Bride, held in the vestry of the church. Mr. Lile (a member of the Court of Common Council) said that in such an important improvement much time was needed in order that legal matters might be set right, but he thought that he could safely say that the work would be taken in hand very shortly. The widening of Fleet Street would surely come, and the tenants would, he had no doubt, be dealt with fairly.

Swiss Archaeological Society have yielded important results. Large Roman villas and an amphitheatre have been disinterred, and, besides a large quantity of coins, pottery, bronze, and ironware, some large silver vessels have been discovered which are said to only have their equals in the famous treasure-trove of Hildesheim, in Germany, brought to light in 1868.

THE recent fire in Cripplegate was the subject of important consideration at the meeting of the City Commissioners of Sewers last week. Mr. F. McCarthy, one of the Cripplegate representatives, moved that it be referred to the Finance and Improvement Committee to consider and report as to the desirability of taking steps to effect improvements in the

district affected by the fire. For the last thirty-two years, he said, rebuilding in the Ward of Cripplegate Without had been going on, new buildings had occupied the exact sites of the old, and there had been, to put it plainly, "jerry-building" of the worst order. —Mr. Stapley, seconding the motion, said the area of the fire had always been regarded as among the most dangerous in all London. The widening of streets, the severance of large blocks now difficult of access by the fire brigade, and the provision of unbroken party walls, were matters advocated by his constituents, and they well deserved the attention of the Commissioners. —Mr. A. A. Wood supported the resolution. He believed that the so-called model fireproof buildings were a mockery, a delusion, and a snare, and were conducive to much of the vast destruction that arose at fires. —Mr. Deputy Johnson considered that as the London County Council would have to be asked for a contribution towards the expense, it should be consulted as to the extent and scope of the improvement. —Eventually, after considerable discussion, Mr. McCarthy's resolution was carried, and power was given to the Committee to confer with the London County Council, if necessary.

WHEN the Duke of Devonshire was a boy he used to walk from Compton Place (his Eastbourne seat) to the Wish Tower all the way through corn fields. When the Marquis of Salisbury (who is at present staying there) looks forth from that pleasant house towards the sea, he may find it difficult to realise such a possession. The Wish Tower, which was one of the martello towers built round the wide semicircle of Pevensey Bay to guard against French invasion, stands now about the middle of the Eastbourne Parade. A town of nearly 40,000 inhabitants, with spacious, well-paved streets, fine shops, numerous places of worship, and a busy railway station, stretches out to east and west, and inland almost up to the gates of Compton Place. The change is due in the main to the wise ordering of the late Duke, who encouraged the growth of Eastbourne as much as possible, and was at the same time careful that it should grow up an agreeable town.

THE first exhibition of works by English painters, at the Jordan Art Gallery at Boston, U.S.A., is attracting its right share of attention, and will remain open until the end of the year. The Boston Journal observes that "the fine arts of England are indicative of the domestic nature of the artists and people alike, and it is a proven fact that the English really support their artists vastly better than any other nation." This is, of course, satisfactory, but there is better news still, which proclaims: "As for that, if an Englishman is in earnest he is successful in any branch of profession at home." Says the same optimistic critic, "seven-tenths of intelligent London visit the art displays"; but it is perhaps less immediately encouraging to our cousins across the Atlantic to hear of their own products that "America will arrive to greater perfection and appreciation, but it will not be for one hundred years yet." But to return to the exhibition, it is referred to as "the most progressive, far-reaching art educational event" (in the history of Boston), "that of exposing the world's masters at the Jordan Art Gallery." However, without being on the spot, we may say that the catalogue is full of the names of favourite members of our different art societies, some of whom are represented by a number of contributions, and let us hope they will be fully appreciated according to their merits.

OUR Parisian neighbours are working apace at the preparations for their exhibition to be opened in 1900, and judging from the advanced condition of the building they mean being ready in ample time. If so, it will be a sort of record, for it may be remembered that the last exhibition was terribly behind. The plans and drawings of the exhibition, which France is going to rear out of compliment to the moribund century, are on a scale of elegance and beauty undreamt of in our time. A bridge in memory of the late Czar and his proved affec-

tion for France will span the Seine in the very centre of the exhibition, and the buildings will flank the river front on both sides. Perhaps the most splendid of the many erections will be the Palace of Beaux Arts, now so fairly advanced that one may judge what the ensemble will be like. Already exhibitors and railway companies are waking up to the importance of this great enterprise, and applications for space are being sent in.

A CORRESPONDENT writes with reference to the use of double-glazed windows as follows: "The idea of two panels of glass in the same sash or casement is fallacious, for the following reasons, viz.: (1) The inner thickness—a loose sheet of glass—would have to be taken out every time the window needed cleaning. (2) Cold air is not effectually kept out in exposed positions unless the two lines of glass are 12in. apart, and thus enclose a wall of fixed air. (3) The air admitted at the joints of the sash would remain unaffected by the double glazing. (4) To a large extent the same result may be obtained by the use of thick plate glass and carefully contrived woodwork. But double glazing by double sashes, with a wall of air between, is a matter sometimes of great importance. A few years ago, when building a vicarage, the clergyman insisted on having his study made to face due north, where he could command a view of his parish when writing his sermons. I met the case by providing sliding shutters, glazed with large sheets of plate glass. The result was that the room had the same protection on the window side as could be derived from a solid wall."

THE work of the Jungfrau Railway is being pushed forward, in spite of the severe winter weather. In Lauterbrunnen, water power to the extent of 2400 horse power is now available, and half of this force is being utilised for the electric dynamos employed in the boring of the Eiger Glacier Tunnel. The mountain stream has been diverted from its course for a distance of ten kilometres, extending from the waterwheel house to the Scheidegg station and the Eiger glacier, and the open line between the Scheidegg and the glacier, with a tunnel of eighty metres, is prepared in its main details so that the electric railway over this tract can be opened in the first half of next June, and in time for the tourist season. The principal tunnel has been carried to a distance of 150 metres by hand-boring—mainly the work of Italian excavators—and the preliminaries for tracing out the great tunnel have been accomplished after some two years' labour. The rock is found to be excellently adapted for tunneling, and experiments on the Jungfrauoch have proved that it is reached at a depth of 25 to 30 metres under the snow, instead of 70 metres, as was at first apprehended.

LECTURING on "The Pre-Raphaelite Art of Sir J. E. Millais," at the London Institution, Mr. Whitworth Wallis said Millais was really the founder and leader of the Pre-Raphaelite School, whose object was to throw off convention and paint Nature faithfully. In choosing their name Millais, Holman Hunt, Rossetti, and their companions were guided by the conviction that previous to Raphael artists went solely to Nature for inspiration, whereas, after Raphael, they sought rather to paint fair pictures, and above all saleable canvases, a practice which had led to a decline of Art. Millais' early paintings were received with outrageous insults which the present generation could scarcely conceive, and which proved the astounding artistic ignorance of the time. He continued a Pre-Raphaelite till nearly 1860, in which year his "Black Brunswicker" showed a new Millais. During the last thirty years of his life, he was himself rather than the representative of a school. However great were his works in the later period, his reputation would rest mainly on the cycle of artistic triumphs in his Pre-Raphaelite days. The greatest painter of the century, his work quickened sympathy for which we could not be too grateful. To know him personally was a delight, as Mr. Wallis could testify. The lecture was

illustrated by many good lantern views of the dead artist's pictures, including "Waiting," a work practically unknown to the public. It represents a girl sitting on a stile between high walls, overhung by trees, and belongs to Mr. Edward Nettlefold. Drawing on knowledge obtained from Millais himself, the lecturer declared that the original of the man in the celebrated picture, "The Huguenot," was not a brother of Wilkie Collins, as some people supposed, but General Arthur Lempriere.

MR. HENRY CLARKE, a member of the London Corporation, having expressed a desire to contribute a painting of the value of 1000 guineas, commemorative of the Queen's visit to the City, for the Art gallery at Guildhall, the commission has been entrusted to Mr. A. C. Gow, R.A. The picture will represent the Jubilee service outside St. Paul's Cathedral, and includes the whole of the façade of the cathedral and the personages assembled there, including the cavalcade of princes. Her Majesty will, of course, be the central figure. The work, which will entail a great amount of labour, will not be completed until 1899, when it will be included in the exhibition of the Royal Academy.

DR. CONAN DOYLE'S newly-occupied house at Hindhead lies just below the crest on the east of the Portsmouth Road, and looks southward over a fair and varied scene of heather and bracken, rolling hill and wooded valley. But for the tennis-lawn and a little planting the property is left in its original wild state, the novelist's great endeavour having been to retain the special highland character of the country. Trophies of arms from London, and a great window emblazoned with Dr. Doyle's family history, adorn the entrance hall. Mindful of his several years' residence in Portsmouth, while practising medicine, Dr. Doyle chose both his architect and his builder from that town.

ON Monday next, December 20th, there will take place at the People's Palace, in the Mile End Road, in connection with the Jubilee exhibition of trades and inventions now being held there, a practical competition in wood-carving, for members of the trade and for apprentices. This competition consists in the carving of an acanthus leaf in pine wood, 12in. by 9in., while for amateurs, who can also compete, the subject is optional, though the size is the same. Silver and bronze medals and certificates will be awarded, and Messrs. T. J. Perrin and J. Ross, of the Institute of British Wood Carvers, will be the judges. Entries will be received up to Saturday next, the 18th inst., and wood will be provided at the Palace, but competitors furnish their own tools. This is a move decidedly in the right direction, and one we hope to see imitated by other polytechnic institutions.

BEAUFORT CASTLE, Ross-shire, the seat of Lord Lovat, stands in the centre of an extensive level park on the south bank of the Beaully river, about three miles from the town of the same name. Unlike most of our Highland castles, Beaufort has no claims to antiquity, for it is a magnificent modern castle, which was only finished fifteen years ago. The mansion house is built on the site of Castle Dounie, described by Sir Walter Scott in his "Tales of a Grandfather," and destroyed by Cumberland's troops after the battle of Culloden. This splendid mansion is in the Scottish baronial style, with heavy masonry—built of old red sand-stone from the Redburn quarry, about two miles from Beaully—with mullioned windows, bill-roofed turrets, and crow-stepped gables. It is 300ft. in length, with an average width of 80ft. The main building, which contains eighty-six different rooms, including the family chapel, consists of a western tower, a central block of private apartments, and an entrance tower, flanked by a central tower 100ft. high. It is altogether a picturesque and imposing pile, distinctly seen from either road or rail, and it is also a prominent and striking object in the beautiful and varied landscape by which it is on every side surrounded.

BRICKWORK TESTS.

REPORT ON THIRD SERIES OF EXPERIMENTS.

AT a meeting of the R.I.B.A., on Monday evening, 13th inst., Mr. Wm. C. Street read the report on the third series of experiments conducted by the Science Standing Committee, to ascertain the average strength of various descriptions of brickwork. The Report stated that the experiments were completed last spring by the crushing at the West India Docks of twenty short lengths of brick walls, each about 6ft. high by 27in. long and 18in. thick. The Committee did not propose at present to give any fixed rules based upon the results or information gained by these experiments, as it was hoped that the Council of the Institute would sanction the preparation of a careful analysis of the facts contained in the three reports, and issue it in a suitable shape. If this were done it might be possible to generalise and formulate rules to govern the use of different kinds of brickwork as the supporting features of the structures erected under their superintendence. Meanwhile a few impressions could be given. The resistance of brickwork in lime mortar to crushing seemed to vary from one-sixth to one-eighth of the resistance offered by the brick itself, while in cement mortar it varied from one-half to one-fifth of that strength. So while cement mortar materially aided the weaker bricks in their combined strength, it could not materially affect the ultimate

POWER OF RESISTANCE IN BRICKWORK

made of a harder variety. The different specimens in lime mortar and those in cement mortar showed comparatively little difference in the respective rates at which the beds were crushed. The only question was how long the bricks would be able to resist the pressure if the load were increased at these rates. The average thickness of the bricks was 2 $\frac{3}{4}$ in., and the total thickness of the mortar beds 6in., while the compression of the lime mortar beds averaged 1in., and that of the cement mortar beds about $\frac{1}{2}$ in. This proved that the mortar generally was well crushed and disintegrated long before the final collapse of the several examples of brickwork. In dealing with the working load that might be calculated upon, care must be taken not to impose such a load as would materially damage the structure of the brickwork. At one-fifth of the crushing load the compression in lime mortar averaged $\frac{1}{5}$ in. in 6ft. of brickwork, and in cement mortar it averaged $\frac{1}{10}$ in. The great

DIFFERENCE BETWEEN DEAD AND LIVE LOADS

must not be lost sight of. Taking a safe load as one-fifth of the crushing load, it might be assumed from the results obtained that in lime mortar stock brickwork is equal to about 3 $\frac{1}{2}$ tons, Gault 6 tons, Fletton 6 tons, Leicester red 9 tons, and Staffordshire blue 23 tons per square foot. In Portland cement mortar, 1 to 4, Stocks would be equal to about 8 tons, Gaults 10 tons, Flettons 11 tons, Leicester red 17 tons, and Staffordshire blue 24 tons per square foot. Under the ordinary or average conditions of practice, the form of brickwork did not greatly affect the strength, the 18in. square piers having given approximately similar results per square foot to those obtained from specimens 27in. by 18in. With regard to the effect of age upon the different varieties of brickwork, results showed that, except in the case of blue bricks in cement, those built three months gave very similar results to those built five months. The difference in the case of the blue bricks was partly due to the fact that the bricks of which the specimens 27in. by 18in. were built were from a stronger lot than those of which the 18in. square were built, the samples from each delivery failing respectively at 779 and 701 tons per square foot.—Mr. Max Clarke then, by the aid of lantern photo-

graphs, described the crushing of each pier, and detailed the results.—Mr. F. Gordon Smith, as Chairman of the Committee, drew attention to the increased interest in this last series of tests owing to their having been made upon an actual wall as distinguished from ordinary brick piers. He expressed regret that the Committee did not have more money to continue the experiments.—Professor Unwin pointed out that this was really not the report of the General Committee, but of two members of the Committee. Far be it from him to grumble at that arrangement, but he was obliged to make

SOME CRITICISM.

of the way in which the reports were drawn up. As this was the last of the reports, he thought it was rather a pity that some matters to which attention had been called formerly had not been noticed. A year ago he objected to the tabulation of the second and third series of tests, and it would have been as well if, in the final report, some attention had been given to that objection. He thought the result, as put forward a year ago, completely confused the teaching of the results. Before the beginning of the work, when the arrangements were made, he, as one interested, drew attention to the want of supervision of quantities of lime and sand used in the mortar, and the way in which it was mixed. He was told by the architects, who were more interested in the work than himself, that they wanted experiments upon ordinary piers under ordinary supervision, and, therefore, that it was impossible to take notice of these points. The result was, they had piers built in the ordinary way. Even now it was almost impossible to tell exactly what was done at that time. The committee themselves were so dissatisfied that they had certain piers rebuilt and tested differently. The second series were built under much greater supervision, especially as to the way in which the mortar was mixed and used. He understood that at that time better sand was used than in the case of the first series. Mr. Clarke was good enough to write to him afterwards, and say that he was mistaken, but he did not seem quite certain, and invited him to come and examine the records. But there was no question, even from personal observation, that

THE MORTAR USED

in the second series was very much better than in the first. After three months the mortar employed in the first series crumbled in the hand in a way he had never seen before. Finally, in building the third series, in the shape of walls, they used quite a new quality of sand for making the mortar, and it was a much superior quality. He was greatly surprised that in the third report no reference was made to this fact. He attached great importance to the quality of the mortar used in these experiments, and believed that the results of the tests were largely obtained, in fact, almost exclusively, for the different qualities of sand used in building the piers. It was quite clear that they must not mix the results of the first and second series with those of the third. In conclusion, Professor Unwin drew attention to his tabulated statement of the tests as compared with that of the Committee.—A member also expressed the opinion that the report did not make nearly enough allowance in the ordinary work as to the stability and quality of the mortar, the quantity and the mode in which it was made. In such tests as this it was absolutely necessary that all the circumstances should be as equal as possible throughout.—The President said it seemed an extraordinary thing that mortar such as no architect who had any acquaintance with building would use had been employed in the tests. He observed, however, that they owed a debt of gratitude to the Committee, to whom he proposed a vote of thanks.—Mr. Max Clarke, responding, said it was an absolute fact that the first and second series were built of the same quality materials. With regard to the third, he explained that they had very good sand, but had not sufficient to finish the work, and so it was completed with another quality not quite so good.

FORTHCOMING ART METAL WORK EXHIBITION.

WHAT promises to be an interesting exhibition of Art metal work is to be held at the Royal Aquarium, London, in June next. The promoters of the movement have already secured the support of several well-known workers in Art to serve upon the Council. The Council recently met at the Aquarium to consider the conditions and other details connected with the competitions to be held, and for which gold, silver, and bronze medals, and certificates of merit, will be awarded. Competitors have plenty of choice of subjects in which to display their talent.

DESIGNS ARE INVITED

for no less than sixteen—namely, a street lamp-post for electric light; a wrought-iron open panel; a weathercock; repoussé coal-scuttle in copper; pair of wrought-iron carriage gates and piers, opening to be 10ft. wide; wrought-iron grille, 12in. high by 8in. wide, in solid oak door, with hinges, lock-plate and knocker; wrought-iron ornamental open screen with door in centre, dividing a hall in a residence; wrought-iron or brass casket with enamel panels (its object to contain the freedom of a city to be given to a general who has served Her Majesty successfully in India); metal end of a carriage-pole for a mayor's State carriage, the city a sea-port; a brass repoussé book cover, the book "The Pilgrim's Progress," its size large quarto; a grille, to fill a semi-circular arch 10ft. wide, the design to be executed in wrought-iron, and to contain a central feature; a lantern in brass or iron, suitable for a parish church; wrought-iron balconette, 4ft. wide, projecting 3ft., and supported by cantilever; ornamental guard to prevent flower-pots falling into the street from the window sill; cast-iron stove and mantelpiece to overmantel, total height not to exceed 7ft. 6in., including overmantel; and lastly an ewer and basin, soap dish, and sponge basin. The method of execution of the drawings is left to the competitor, but the drawings must be practical and workmanlike, such as a craftsman would require. The seventeen subjects in

THE HANDICRAFT COMPETITION

are: A lin. square upright standard diagonally placed through bar, in ornamental head; a stanchion head and saddle bar, bilged; a clean welding of scrolls, not split; spray exhibiting husks and covered junctions on each side of the stem; spray and natural foliage; a panel, 18in. square, of interlaced bars and centrepiece scroll; a pilaster filling alternating scrolls and husks; a hinge with rose and thistle terminations; ornamental projecting trade sign, with name panel in pierced lettering; repoussé copper or brass plate, diameter about 12in., over a wrought-iron knocker; lead ornamental embossed head for 4in. rainwater pipe; two lead ears of different design to secure 4in. by 3in. lead pipe; a panel of a lady's card case; a key bow in gold, silver, or iron, for a dressing case; and a pewter Ewile. The Exhibition will be open from June 1st to 15th. A record will be kept of the time occupied, and in case of equality of merit, the advantage will be given to the competitor who has done the same quantity of work in the least time. All designs will have to be sent in by May 3rd. Besides the competitive section, it is proposed to collect a loan exhibition, representing different periods of Art metal work.

A VOTE of condolence with the family of the late Mr. J. Loughborough Pearson, R.A., was passed at the meeting of the Institute reported here. The President paid a warm tribute of respect to Mr. Pearson's memory, observing that he was one of the most distinguished of our ecclesiastical architects. Those who knew him must have loved him, and those have seen his work must have admired his genius. The vote was carried in silence.

PROFESSIONAL PROBLEMS.*

By T. WALTER L. EMDEN, J.P.

IT may seem ungracious, but it certainly is not meant so, if I say that I do not believe in societies as at present constituted, and that for most of the years of my professional existence I stood aloof from them, and only joined this Society because of its efforts to obtain a Registration Act for architects, and with a desire to help in this programme. I say this, not as being against such institutions which have sought to do good work, and no doubt have done much, but because I find, and have always found, that while they purport to give the public an assurance as to the capabilities of an architect, practically without

COMPULSORY REGISTRATION

they cannot do so. There is no compulsory regular examination, and no diploma issuable under the law as in the case of other learned professions; indeed, while anyone can set himself up as an architect, without any examination, and without previous study, experience, or competent knowledge, and as long as examination is voluntary, the best benefits of these societies are but small security to the public. Examination is no doubt more or less insisted on before entering the Royal Institute and other societies, but this does not meet the case, as while the use of letters indicating the connection of persons using them with any society may mean that some examination, more or less, has been accomplished; many, indeed by far the greater number, do not belong to any society and yet practise. Many of the most competent men practise without belonging to any society, so that it is seldom the public enquire, or care, if the professional man employed belongs to a society or not. Let me again point out and insist upon the fact, that as anyone, never mind what his position is, can call himself (even be he a labourer, or, as in a known case, an undertaker) an architect, surveyor, or engineer, without let or hindrance; and as

VOLUNTARY EXAMINATION

can afford no real protection to the public, that the architect employed will design sanitary and properly constructed buildings, I can but conclude that, except absolute compulsion is enforced under an Act for Registration, nothing will accomplish the exclusion of the incompetent. The duties of the architect, or master builder, no doubt originally covered the engineering efforts as well as the architectural efforts of the ancient world. Unfortunately, at the present day in England, and probably to a great extent because there is no State intervention in the shape of compulsory examinations (as in other countries), there has grown up in the work of the architect less knowledge of construction in its larger form, and a separating of engineering from the architectural work, and hence, want of artistic design in our great engineering works. The engineer has to be called in when a large or difficult work of construction has to be carried out, and the designs of our railway and other bridges and railway stations, &c., show the

WANT OF ARTISTIC EFFORT

there is in dealing with what are now called engineering works, as distinct from architectural. Could we, for an instant, compare modern aqueducts or viaducts with the ancients, with the advantage to the modern designer? Much has been done of late years by various Acts of Parliament relating to buildings, and for the preservation of public health. A serious difficulty, however, is that each step requires an Act of Parliament framed more or less by men with incomplete knowledge or experience of the necessities, while the alterations necessary in the present Acts so indirectly affect the public that it takes years before even the most simple or urgent necessity for alterations or modifica-

tions in the law become apparent and obtains a remedy. I cannot but think that much might be done if the Local Government Board could be made more regularly and consistently the recipient of information gained by local and other authorities of the

VARIOUS NECESSITIES IN BUILDING

and its sanitation. The Board should be authorised to set machinery to work to obtain from the various surveyors in the districts regular reports, and could therefrom draw information for the alterations necessary in our Public Health and Building Acts, invoking the action of Parliament in the same way as in a question of insanitary areas, by a Provisional Order. Much would thereby be gained and dangerous delays saved. Undoubtedly, and more particularly as far as London is concerned, the New Building Act is a step in the right direction, and one cannot but admire the courage and perseverance of Dr. Longstaff, L.C.C., who was chairman of the Building Act Committee. The more so that he, a layman (so far as building was concerned), set himself to work to become master of the enormous mass of details, and all the pros and cons and necessities for alteration, and should have succeeded in carrying through so voluminous an Act, as this necessarily was, to what must certainly be called a successful issue. No doubt it will prove of

GREAT ADVANTAGE TO LONDON,

and while its errors must be remedied as they appear, its benefits must not be forgotten, as the Act is a substantial step in advance. One of the difficulties which has to be contended with by the professional man is the overlapping of the powers of the various authorities. It is a crying evil in London, where the central authority deals with frontage lines, projections, construction, and all such-like matters, and puts in action its own surveyors, that there is in each district the surveyor of the local body also dealing, more or less, with the same subjects and other overlapping duties. If the central authority laid down the rules and regulations under such Acts as deal with these questions (after consultation with the local authorities), and the local authorities administered them, much expense to building owners would be saved, and the public also, by preventing

THE DUPLICATION OF OFFICIALS

and duties, and further friction, as useless as it is delaying, avoided, thus facilitating building operations to an enormous extent. To pass a set of plans under the present system is not only a complicated, long, and harassing process, costly to the building owner, but is without increasing the protection of the public—indeed, is wasteful and unproductive of any benefit at all. A very substantial fee might well be obtained from the building owner, under the simpler system for the passing of and licensing plans, leaving the owner better off than now, and making the public purse the richer. As a step in the right direction, it ought to be possible, and I think it is possible (were an effort made), to so arrange the surveyorship for the authorities that one surveyor in each district should suffice, and that the central body should delegate (as I have suggested, after laying down the rules under which the local authority should administer) the active administration to them, and so avoid overlapping, and facilitating very considerably building operations. Another

COMPLICATION IN TOWN BUILDING

is consequent upon our system of leases, and the necessary intervention of the surveyors to freeholder and intermediate owner; and here, as private rights are touched, it is difficult to frame laws to deal fairly with it, to save the uncertainty, expense, and delay, and yet fully protect owners' just rights. Indeed, it is so difficult and delicate a subject to handle, that it will be a bold man who accomplishes it. I make it as a suggestion, but as that only, that the building owner should be at liberty, after notice given to the freeholder or superior landlord, to make the alterations he may deem necessary, subject to a right to the freeholder or superior landlord to formally object, and the objection (failing agreement) being heard

and determined by a permanent official under the Local Government Board. I should like to turn for a moment to

SANITATION,

and ask you to consider how much might have been accomplished by the present time—how many lives saved, and what spread of disease prevented—had the professional man to pass thorough examination and obtain an intimate knowledge of the necessity of sanitation first, before practising. What I say does not apply to individuals, many of whom have done great and important work in this direction. But can it be said the Profession, as a body, has a thorough knowledge of this subject? By the neglect of each Government to provide for compulsory examination, and the registration of competent men, they have now much to answer for in this direction. In England, with our free trade principles, we have, I think I am right in saying, hundreds of systems and apparatus stated to be, and no doubt credited with being, good, and capable of accomplishing sanitary perfection, but, except by

THE TEST OF EXPERIENCE,

what examination into these claims is brought to bear? And specialists, each with their own specific, are called in instead of the architect, and no system is thoroughly or effectually exploited. Experience may often be dearly bought by those who have to submit to the use of some so-called sanitary apparatus or arrangement of house or other drainage until its defects are discovered. It is no one's business to say which is best, and even our local authorities pin their faith to different systems, no doubt recommended by their officials. How, then, can professional men be expected to deal more thoroughly than the authorities do? Surely this is folly, when so much depends upon what is used. Can it be wise in an age when vast numbers congregate together, and great cities are created in our own Empire, for such a state of confusion with regard to this most important factor—sanitation—to be allowed to go on unimpeded and almost unthought of until some great calamity visits us? The fact is, no public body and no authority likes to take the responsibility of recommending anything new; but I contend that the Local Government Board should be obligated by law to take up and examine into the necessities, and lay down what should be done. In latter years no doubt advance has been made, but, until some such power as I before suggested is delegated to the Local Government Board, and those whose duty it is

TO DESIGN AND SUPERINTEND BUILDINGS

are compelled to pass a thorough examination, no thorough knowledge can be assured, even though there depends upon it the life and the health of every individual citizen. With regard to the question of Art, undoubtedly much progress has been made during the Victorian era. When we look at the houses built not long before the accession of the Queen to the throne (such houses as form the various squares of London) we obtain at once a very fair exemplification of what was considered a good class of dwelling-house of that period. Compare these with a good dwelling house of the present period. Sanitarily and constructively we have improved, but certainly in comfort, luxury, and artistic design the advance made is strikingly great. Take again the shop of sixty years ago, and compare it with the artistic design of much of the work of the present day, and the advance will again be strikingly seen. If we turn from this to a higher branch of work; to our more public buildings in the shape of churches, hospitals, theatres, music halls, hotels, restaurants, &c., at once the luxury and artistic improvement are so marked that one can hardly believe the whole of it has been accomplished in the space of one reign. Moreover, when it is considered that the improvement has come about not because the State has lent its aid, but has been accomplished under many difficulties, it becomes a useful study to consider not only how much greater it would have been, but how much waste in its accomplishment might have been saved had compulsory examination and

* The Opening Address of the Session 1897-98, delivered before the Society of Architects, by Mr. T. Walter L. Emden, J.P., President, on November 25th, 1897.

registration protected the investor and public. This advance, however, speaks much and well for the energy and artistic effort of the architect, and, considering the difficulties he labours under, should not be forgotten. Too much credit cannot be given to those who have fostered and increased the strength of artistic effort in this country, overshadowed as it is by the question of almost everything having to be done by private enterprise, and that even in the most elaborate decoration of buildings for public use, the owner's first consideration must be that it shall pay. I would, before leaving this subject, like particularly to draw attention to the great spread, among the people at large, there has been in Her Majesty's reign in artistic teaching. Many institutions and schools have grown up by the efforts of the City and the London County Council, and other corporations and public bodies in the establishment of

TECHNICAL SCHOOLS,

and much has been done to educate those who have taste and intelligence, and are willing to devote their spare time to the study of artistic work. A short time back a small exhibition was made at the offices of the London County Council of work turned out from some of its technical schools, the work for the most part (I think I am right in saying) of young people of about fifteen years of age. The work consisted of some excellent examples of enamel, *repoussé*, carving, painted glass, and joinery, plumbing, and other work. Without taking into consideration the comparatively short time for which these schools have been at work, the work generally was highly creditable, while the artistic work showed such promise as bid within a generation to take away the stigma which has so long been placed upon the English people, that they are wanting in artistic design and taste in their work as compared with that which comes out of the French and some other Continental workshops. It has always seemed to me a pity and a neglected opportunity on the part of trades unions that they do not make an effort to improve their workers, set up an examination in their trades for each union, and thus be able to assure employers as to the competence of the man employed, and enable, by its certificate, the workers to show which are its best men. It would certainly serve a useful purpose; more useful, I think, than some of the other work the unions do, and I believe it would place them in a better and higher position in public opinion. I have often heard it stated that if the Profession of architect were to become a registered profession, dealt with by compulsory examination, that the

ARTISTS IN THE PROFESSION

would be hampered and prevented from taking up the Profession; but when it is seen that not only many of those who are actual workers with their hands by day can, in their evenings, turn out such good work, this reason against the compulsory registration of architects falls to the ground, as it would also if tested by the result of the efforts which in the old days were made by the great architects and artists, who often enough struggled through years of hard work in manual and other trades to make themselves, as they eventually succeeded in doing, artists. Indeed, the original architect was the master builder. It cannot be for a moment supposed that artistic effort can be deterred or kept back or even inconvenienced by a knowledge of construction and sanitation. It would be as reasonable to say that a sculptor or artist should not know the anatomy of the body, as his examination in it would be

DETRIMENTAL TO HIS SKILL.

I cannot think either that the Royal Institute gives credit to such a reason, or it would not have established an examination for those who wish to enter its ranks. Construction was the duty of the first designer of a building when there was no distinction of engineer and architect. As civilisation grew, the ornamentation, or the artistic portion of the architect's work, grew also; but it grew out of construction, and should be the refining and finishing of it and consequent to

it. The best specimens we have of Architecture are those which, by form and construction, give necessity for ornamentation. It would be difficult to say that the architectural

PROFESSION WAS NOT A GOOD ONE

for young men to enter; but it can safely be said that it would be a better Profession for them to enter if its status were more assured, as it would be if they had to pass a compulsory examination, proving their knowledge and title to professional position before assuming it. It would by no means discourage those who were worth encouragement, while it would keep out the element of uncertainty, and be an assurance to the public of the capability of the architect to design a building, and his capability also of seeing that the construction and sanitation were well carried out. We are often told that vested interests must be considered, and such vested interest in the Profession would mean admitting large numbers of incompetent men; but the delay in obtaining compulsory registration and examination only allows the evil to grow, and its establishment would stay it altogether, while death would, within but a few years, deal with the evil as it existed at the passing of the Act. But I personally do not agree that this vested interest is such a large factor, at least where it

ABSOLUTELY COVERS INCOMPETENT MEN.

When Parliament intervened to protect the public from quacks, both as doctors and surgeons, and later as dentists, there was this same vested interest and incompetency; yet where is it to-day? And all this has been accomplished during her Majesty's reign. No, the real difficulty is poor humanity, poor selfish humanity, those who fancy their position is now assured and forget others, and would keep them outside the pale. Those who think that having some letters to add to their names, forget the public and the greater interests at stake, for their own more personal interests, and prevent, or at least do nothing to help, the cause this Society has at heart. There is a strong feeling of jealousy in some quarters, and of a dog-in-the-manger principle (forgetful of all public duty) which causes opposition to what all are bound to acknowledge would be good and beneficial if accomplished. This feeling raises difficulties of detail and petty points, enlarges upon them, and while many of them are so trivial as to have no real existence, they are used all the same to conceal the real desire not to help the cause of registration. I trust this course will not serve their turn, and will not succeed in preventing the remedy being eventually obtained.

THE Court of Governors of the Hospital for Sick Children, in Great Ormond Street, has decided to purchase for £30,000 the adjoining premises. These, which are the property of the English Knights of the Order of St. John of Jerusalem, consist of the Hospital of St. John and St. Elizabeth, the Convent of Mercy, and the Chapel of the Knights-Hospitallers. Although the little Chapel of St. John is interesting from its association with the once powerful and universal Order of Malta, it is quite a modern building, and possesses no antiquarian or other interest.

We have received a copy of "The Indian and Eastern Engineer Diary" for 1898. It is well and substantially bound, and, in addition to the usual memoranda and calendar pages, interleaved with blotting paper, contains a host of information which is likely to be very useful to those interested in the engineering and commercial industries generally in the Eastern hemisphere. There is a full list of the names of those holding Government appointments in India, while tabulated statements show the stamp and other duties, Indian weights and measures, and the English value of same, the customs-tariffs, &c. A list of the Indian banks, clubs, and hotels is also included in the reference book, and another important feature is the railway directory, which gives full details of the several lines in India and other parts of the Eastern countries. The diary is published in connection with the Indian and Eastern Engineer, whose offices are at 50, Fenchurch Street, E.C.

CRIPPLEGATE FIRE.

THE ENQUIRY.

DURING the past week, Mr. S. F. Langham, coroner for the City of London, in accordance with an Act of Parliament promoted by the Corporation in the interests of the citizens, has been engaged with a jury at Guildhall in an investigation of the circumstances connected with the recent fire in Cripplegate. In view of the controversy that has arisen in reference to the structural condition of and position of the property destroyed, the proceedings have been followed with a keen interest. The various authorities, from the County Council downwards, were legally represented, and witnesses were examined and cross-examined upon all sorts of theories and statements. Indeed, although at the opening the Coroner stated that the "object of the inquiry was

TO ASCERTAIN THE ORIGIN AND RESULTS

of the fire," a vast amount of time seems to have been spent in listening to and explaining away criticisms upon the efficiency or otherwise of the Fire Brigade, whilst too little attention appears to have been given to the actual purport of the inquiry, which, surely, was intended to discover any defects in the burnt buildings that might have led to the outbreak. The legal representative of the County Council emphasised that "consideration of the means for preventing similar fires in future, and of the action of the fire brigade in extinguishing the fire in question, did not properly come within the scope of the present inquiry," yet these were the very points that seemed to be mostly discussed. At the commencement the City Surveyor (Mr. A. Murray) produced plans, showing the extent of the fire, and after evidence bearing on the actual outbreak, Mr. G. Vickery, architect and surveyor, 50, Gresham Street, was called. He said he was the architect of the premises 28, 29, 30, and 31, Hamsell Street. Nos. 30 and 31 backed on to 15, Well Street, where the outbreak was supposed to have occurred. They were constructed by Messrs. Mortar for Messrs. Harrison and Smith, the freeholders being the Goldsmiths' Company. There was nothing particular about the construction of the buildings. They had frontages of about 20ft. each, and were divided by party walls from basement to roof. There were four stories above the ground floor, so that they were six stories high. In the case of 15 and 18, Well Street, there were well-holes or lighting areas. The depth of the land from Well Street to Hamsell Street was about 75ft., so that the well-holes were necessary in order to get sufficient light into the centre of the buildings. Well Street was, roughly, about 25ft. wide, and Hamsell Street 35ft. or 36ft., with high buildings on either side. In these circumstances the lighting areas were a necessity, if the rooms of the warehouses were to be of any good. These lighting areas extended from the ground floor upwards to the roof, and were surrounded by windows to admit light to the different floors. They were open to the roof, but for the ground floor they terminated in a skylight. The basements were lighted underneath the ground floor by means of glass let into the floor, which was a very common way of lighting basements in the City. The staircases were either teak or pitch pine.

THERE WAS NO STONE STAIRCASE.

Stone was very objectionable for staircases in the case of warehouses of the sort under consideration. In answer to a question as to whether the buildings were erected on the principle of fireproof warehouses, the witness said they were constructed in accordance with the Building Act, and to the satisfaction of the authorities. The different floors were supported on wooden joists. The span was so short that there was no need of iron girders. It would have been a waste of money to use anything but wood. Wood was used for the floors throughout. The City Solicitor asked if the buildings were

run up quickly for the purpose of finding tenants? and Mr. Vickery replied that a building might be run up quickly and yet substantially. No doubt the buildings in question were erected under contract, and a reasonable and proper time allowed the contractors. They were not, however, speculative buildings, or built by a speculative builder. They were constructed under the supervision of efficient authorities, including the freeholders and the public bodies concerned. They were not, therefore, what was generally understood by the term "run up," although, with a heavy ground-rent payable on the property, no time was lost in completing them. They were certainly not "jerry built." They were light buildings, and the fact that he had not had occasion to inspect them for any defects since their occupation was an answer to the question as to whether they were "jerry built."—The foreman of the jury asked the witness what he meant by the remark that stone staircases were objectionable?—Mr. Vickery replied that so soon as the stone staircase of a building became exposed to fire it flew in pieces. The good old oak staircases that were put into buildings 100 years ago would stand the fiercest fire for hours, but stone staircases were a delusion, unless properly protected. People could not

AFFORD TO USE SOLID OAK

nowadays for such purposes, and he did not know that they could get it if they wanted it. It was almost impossible to render a building fireproof if combustible goods were stocked on every floor.—Among the subsequent witnesses was Superintendent Stubbings, who was asked if he could account for the fire spreading with such rapidity, and said the buildings were constructed "from the fireman's point of view, with an utter disregard of safety from fire. They were what he might call tunnelled buildings, and the openings at each end greatly assisted the fire to travel. Moreover, the streets were narrow, and the stock contained in the buildings was, in many cases, of an inflammable nature.—It was not till Friday that the jury were supplied with further professional evidence upon the structural details of the buildings.—Mr. E. Woodthorpe, F.R.S.B.A. and F.S.I., from his professional experience, attributed the collapse of these buildings to the ironwork letting the buildings down and to the fierceness of the fire. He found very few walls upright. Many had collapsed in his presence without any notice. The walls had been shaken by the sudden expansion and contraction of the iron, and the brickwork and stonework had been much damaged with the heat. He saw one wooden beam lying in Hamsell Street, but it had fallen down. It was not consumed. Asked for his opinion as to the cause of the fierceness of the fire, the witness gave it as the internal construction and the internal fittings of the buildings. In many of them there extended, from floor to ceiling practically, large wooden pigeon-holes with narrow passages between; in many of the buildings the staircases were separated, as they generally are in this class of building, by wood and glass partitions; the offices and rooms in many cases were divided by wood and glass partitions; in several of the buildings the walls were matchlined, and some of them painted. It was practically possible to construct a fireproof building, at any rate a building which would stop a large spread of fire.—The inquiry was adjourned.

THE architects selected for the Naval and Military Palace in the 1900 Paris Exhibition are Messrs. Auburtin and Umbdenstock.

THE Secretary of State for Foreign Affairs has received from Her Majesty's Minister at Lisbon copies of a Royal decree of November 18th inviting tenders, to be received at the Department of Public Works in that city by January 25th next, for the construction of the drainage works and sanitary improvement of the city of Coimbra. The conditions of tendering may be inspected at the Commercial Department of the Foreign Office any day between the hours of eleven and six.

Professional Items.

BURTON-ON-TRENT.—A new church has just been erected at Stretton, Burton-on-Trent, at a cost of over £30,000. The present edifice occupies a site somewhat removed from that formerly covered by the small, unpretentious parish church of St. Mary. It is cruciform, and has a massive central tower rising immediately over the choir. Stanton stone is used externally, but the interior walls are of Run-corn stone. The woodwork and the appointments are mainly in oak, and the flooring consists of stone quarries and wooden blocks. A high screen, of handsome design, and carved in exquisite taste, separates the chancel and the south chapel from the nave. It is surmounted by a cross of exceptional size and beauty, and, together with the choir stalls and other work hereabouts—not omitting the elaborately carved organ-case and the pulpit—has been carried out by Mr. J. E. Knox, of Kennington. The chancel is laid with black and white marble of a bold and effective design. There is much decorative work of a high order here, the roof being embellished with representations of angels' playing upon instruments. The roof of the nave is also particularly pleasing, being light in colour, and in keeping with the rest of the building. For the whole of this Mr. Charles Powell, of London, has been responsible. The only stained glass window at present in the church is at the east end, and is the work of Sir William Richmond, having been executed at a cost of £1000. The subject symbolises our Lord in His Majesty. There is no reredos proper, but a low enrichment of marble and alabaster is situated immediately behind the altar. There is, however, a dosel of great richness, worked with real gold. Much taste has been displayed in the south chapel, which has a beautifully decorated roof. There are also some fine examples of stone carving by Mr. Bridgman, of Lichfield. The church is lighted with hanging lamps, burning mineral oil, and the heating apparatus is so arranged that it cannot be observed by the public. The large and massive entrance doors are of oak, and are so constructed that during warm weather the lower portion may be closed while the upper portion remains open to admit air. One of the conspicuous features of the church is the font, which is raised on three circular steps of Frostley marble. These display the impress of innumerable fossils. The canopy, of carved oak, is very ornate, and contains in recesses eight sacred effigies. The brass lectern is exceedingly handsome. At the entrance to the churchyard, where there is a noble sweep of greensward, is a lych-gate. The church will accommodate 400 people. The building, which contains a fine organ by Hill and Son, London, has been erected by Mr. Halliday, of Stamford, from the designs of Mr. J. T. Micklethwaite (Somers, Clark, and Micklethwaite), Westminster.

EDINBURGH.—A new United Presbyterian Church has been erected in Fountainhall Road, Edinburgh. Situate on the south side of Fountainhall Road, the new church has been built to the designs of Mr. Graham Fairley, architect, Edinburgh. It is a handsome building, and adds considerably to the architectural features of the locality. Alike in plan and design, the edifice is an adaptation of the thirteenth century Gothic Architecture to the requirements of a modern church. Included in the plan are the traditional nave, aisles, transepts, and chancel; and while the nave is wide in span, the aisles are narrowed to the width of side passages. By means of this latter arrangement all the congregation can see the minister, whether at the lectern or in the pulpit. There is no gallery. The chancel, in which stands a communion table of oak, is reserved for the use of the elders; and the choir are accommodated in the east transept, where accommodation for the organ is also found. So far as the exterior of the church is concerned, the design suggests that the architect has had in view the well-known front of Dunblane Cathedral—different pro-

portions in width of front and of height, of course, necessitating a different treatment of details. Dignified simplicity of design—almost approaching to plainness—in the large and solid grouping, in contrast to the gaining of effect by smaller grouping and richer ornamentation, is the outstanding feature of the structure; and in order to secure a solidarity of appearance, as it were, from the very base, Mr. Fairley has placed a low parapet wall of stone in front of the church, and separating the ground from the footway, instead of an iron railing, which is usually adopted in such cases. Internally the building has an almost plain but at the same time a dignified and impressive appearance. In the vestibule, in the west transept, and in the clerestory of the nave—on the west gable of the building—are beautiful memorial windows, all designed so as to harmonise with the style of the building. Placed on the west side of the chancel, the pulpit is of most artistic design. It is of Caen stone and red marble, and in the niches are figures of the Saviour and of the Apostles Peter and Paul. The desk is of polished brass work. In the centre of the chancel is a lectern of hammered brass work, and on the east side a handsome font of the same material as the pulpit. The church will accommodate a congregation of 600.

GLENADDEN, NEAR PETERHEAD.—There has been about 16 acres of ground set out for the erection of bondwarehouse, reconstruction of distillery, malting and workers' houses, excise offices, house and reservoirs. The work is being proceeded with in detachments, as there the distillery and maltings are working. Messrs. Swanston and Legge, Kirkcaldy and Burntisland, are the architects.

LEEDS.—In the new operating department at the Leeds Infirmary all the most modern improvements have been introduced. The whole department is warmed and ventilated by air which has been washed on the "Plenum" system, and of course open fireplaces and open windows are done away with altogether. The temperature can be raised to 65deg. F. in about a quarter of an hour, and the atmosphere is dry and pure, this being essential to the modern treatment of wounds. There are two theatres, and each theatre has its separate waiting and anæsthetic rooms, communicating by double doors. The walls of the theatres and instrument room are lined with opaline of a light green colour, fixed in large slabs, to avoid joints as much as possible. The floors throughout are constructed of terrazzo, and slope towards a central gully, so as to allow of easy flushing with a hose pipe. A novel feature is the provision of distilled water, both hot and cold, in addition to the ordinary service. The fittings are entirely of glass and iron. The instrument cupboards, which are placed in a room connecting the two theatres, are of the newest available design, and made of glass and gun metal. The operating tables are of metal, enamelled white, and the dressers' and sisters' tables are of white metal and glass. The sterilisers and water heaters are worked by electricity, and the whole department has the electric light. The patients' comfort has not been forgotten. They enter a waiting-room, well warmed and lighted, from which they pass to the anæsthetic room. When under the influence of anæsthetics, they are wheeled forward into the operating room, and thus the patients never see the actual preparations for the operation. The students' benches are of polished teak, and the same material is used for the doors between the various rooms. A recovery room and a surgeons' retiring room are also provided. The department is probably one of the most complete in England.

LONDON.—The foundation stone of a public library, in the parish of St. George the Martyr, has been laid by Mr. J. Passmore Edwards. The building will occupy a corner site on the north side of the Borough Road, within a few yards of St. George's Circus. It will consist of a basement with two floors above, and on the ground floor will be the news rooms, lending library, ladies' room, and boys' room.

The reference library will be located on the first floor, and a set of rooms will be provided for the librarian. The design for the front and two end elevations include terra-cotta dressings. The figure subject over the entrance is to be illustrative of Art, Science, Literature, and Music; and that in the gable will include "The Tree of Knowledge," with crowning figure of "Wisdom," and the arms of the City of London. The building to be erected is designed by Messrs. C. J. Phipps and A. Blomfield Jackson, of 26, Mecklenburgh Square, W.C., and the contract for the work has been given to Messrs. James Smith and Sons, of South Norwood. The amount of the contract for the building is £5556, and there will have to be provided in addition to the cost of the land the sums of £500 for redemption of land tax, architects' commission, &c., and £1500 for fittings, furniture, and cost of books, making the total amount required £12,556.

NOTTINGHAM.—The building operations in connection with the new Empire Music Hall, Sherwood Street, Nottingham, are rapidly approaching completion. The total area upon which the building stands is 126ft. in length by 73ft. in width. The proscenium opening is 29ft. square, and the height from stage floor to "grid" is 48ft. The depth of the stage is some 36ft. All the staircases and the dressing-rooms are to be fireproof, and the hall will be heated with hot-water pipes. The character of the interior decorations will be Oriental, and the upholstery will be of an ornate character. With reference to the seating accommodation, there are to be fauteuils, two circles, pit, and gallery. The latter is to accommodate over 700 persons, the pit over 600, the upper circle some 400, and the dress circle about 220, whilst nearly 80 seats will be provided by the fauteuils. The total holding capacity may be reckoned at considerably over 2000. The architect is Mr. Frank Matcham; the clerk of the works is Mr. Chas. Greenman; the contractors for ironwork and the construction of the sliding roof are Messrs. Whitworth and Co., of London; Messrs. Longdon and Co., of Sheffield, are the contractors for the building; Messrs. Danks and Co., of Nottingham, supply the gas fittings; and Messrs. Blackburn, of Nottingham, have the contract for the electric lighting.

TODMORDEN.—The Free Library, which was opened last week, is of the seventeenth century style of Architecture. Although outwardly not imposing, it is admirably adapted for the purposes for which it is intended. All the rooms are spacious and well fitted. The latest improvements in the way of shelving and indicators have been adopted in the furnishing of the library. This room, the general reading-room, and a reading-room set apart for the use of ladies, are on the ground floor. The library measures 25ft. by 17ft.; the general reading-room 56ft. by 25ft.; and the ladies' room 24ft. by 16ft. The building and site cost £4000.

WEST HAM.—The West Ham Corporation has instructed Mr. A. Saxon Snell, F.R.I.B.A., to prepare plans for the erection of Public Swimming and Private Baths at Plaistow, E.

WIGHTON.—The parish church of All Saints has been re-opened for public worship after restoration. The roof, which consisted only of slates and rafters, has been thoroughly repaired and cladded. The walls of the nave and aisles have been cleaned, in many places replastered and distempered, and the pillars divested of the disfiguring whitewash with which they were formerly covered. The old square pews and "three-decker" pulpit, which occupied a considerable space in the nave, obstructing the view of the east end, have been removed, and the whole of the interior reduced to a more churchlike and uniform appearance. The handsome Perpendicular pillars, among the finest in the county, now that their bases are rid of the unsightly pews which concealed their beauty, are seen to the greatest advantage. The work has been carried out by Mr. T. Hinson, builder, of Wells.

Under Discussion.

THE WINTER SESSION.

"CELTIC ART."

MR. T. H. THOMAS, of Cardiff, lecturing before the Cardiff Naturalists' Society on "Celtic Art," referred to the simple elements of Celtic Art as illustrated by the rude decorations on the oldest relics, and coming down to successive ages showed views of necklaces and other personal ornaments and also views of household utensils. Some of the decorations on the weapons of war shown on the screen were very beautiful, nearly all the designs containing the "revolute" ornamentation, so characteristic of Celtic Art. An especially interesting portion of the lecture was that in which Mr. Thomas dealt with the question of Celtic tumuli and cromlechs. With regard to the origin of the latter, the more they saw of the skill of the Celts as artificers, the more easy it was to be seen that they possessed the knowledge of engineering to a very considerable extent. Coming down to later times the lecturer pointed to the fact that the illuminations in the earliest Celtic missals and other books still preserved the elements which had been the main characteristic of the earliest Welsh Art, as shown on the bronze shields and armour of an earlier age.

A NEW METHOD OF SHORING BUILDINGS.

At a meeting of the Architectural Association of Ireland held recently at the Grosvenor Hotel, Dublin, the President in the chair, Mr. Chas. Geoghegan, F.R.I.A.I., M.Inst.C.E.I., read a paper on a new method of shoring buildings and inserting girders by means of iron frames. The lecturer described extensive alterations carried out by him at the Royal Bank of Ireland, the engineering work being done in conjunction with Sir Wm. Anderson, K.C.B. The lecture was illustrated by diagrams.—Mr. R. Butler proposed and Mr. Geo. Sheridan seconded a vote of thanks.—We hope to publish Mr. Geoghegan's paper in an early issue.

VANISHED LONDON.

At the third meeting of the British Archaeological Association, Mr. Thos. Blashill in the chair, the first portion of an interesting paper was read by Mr. Andrew Oliver on the buildings of "Vanished London." This was abundantly illustrated by a large number of scarce and valuable old engravings and maps of London of the last two centuries and the early years of the present century. Amongst others exhibited were views of Furnival's Inn, Guildhall Chapel, the Stocks' Market, and Ely Palace as it appeared about the year 1536. In this building died Chancellor Hatton in 1591. The last of the Hatton family died in 1772, when the property reverted to the Crown. Views of Holborn Hall in Shoe-lane—the site of which is now occupied by Messrs. Pontifex and Co.'s works and Bangor House—were exhibited and described.—In the discussion which followed the Chairman and others took part, and Mr. Williams remarked that the first house rebuilt after the Great Fire in 1660 was still situated at the corner of Friday Street.—Mr. Gould also spoke as to the actual position of Ludgate, and mentioned that when pulling down Paul Pindar's house in Bishopsgate it was found to be built entirely of oak which had been whitewashed over, and was not of timber and plaster as supposed. The front elevation of this picturesque house is now in the South Kensington Museum.

An exhibition devoted to Fine Arts and Art Industries will be opened at Barcelona next April.

The Whitechapel District Board of Works has decided to purchase land adjoining the destructor premises, estimated to cost £5000, for the purpose of erecting an electric lighting station to provide an installation for the district.

Trade and Craft.

THE SCULPTURED MARBLE COMPANY.

The Brighton Jubilee Monument of Her Majesty the Queen was unveiled on the 8th inst. The contractors were the Sculptured Marble Company, of 11, Queen Victoria Street, E.C., a firm that supplies to importers and exporters Italian marbles direct from the quarries, as well as every description of worked marble and statuary. They also make a speciality of designing and executing public monuments, employing sculptors and masons, either English or Italian, who, in their judgment, are best suited for the work. The monument just unveiled at Brighton stands about 20ft. high. The statue itself is 9ft. high, standing on a pedestal 9ft. 6in. Both are executed in Ravaccione marble, said to be the only kind capable of resisting the effects of a northern climate. The statue is

STATUE OF THE QUEEN AT BRIGHTON.

the work of a sculptor of eminence, who has been entrusted with commissions for monuments throughout the world. This is his third statue of Her Majesty, the others being sent to India and Australia. He has also executed statues of Lord Beaconsfield, Right Hon. W. E. Gladstone, Sir Theophilus Shepstone, Mr. Charles Dickens, Presidents Garfield and Lincoln. His monument in Bahia, to represent the expulsion of the Portuguese from Brazil, is 84ft. 6in. high, executed in marble and bronze, and is a masterpiece of combination of splendidly-sculptured statues, bas-reliefs, and masonry. For his Majesty the King of Italy he executed eighteen colossal statues, and for his native town a magnificent monument, 30ft. high, to represent General Garibaldi. He has been awarded

many gold and silver medals, and created a cavalier of the Crown of Italy and of Spain; he has also received the commendation of the order of Isabella the Catholic. He has just executed busts of Her Majesty the Queen, and of Her Majesty the Queen of Italy, and is now engaged upon the bust of his Worship the Mayor of Brighton. The statue of the Queen at Brighton has been described by the Press as a faithful likeness, exhibiting very great skill in the treatment of detail, and as an ornament to the town of Brighton. Photographs of the statue were sent to Her Majesty, who replied as follows: "Windsor Castle, December 4th, 1897. Dear Sir, I am commanded to thank you for the photographs which you have been good enough to submit for the Queen's acceptance of the statue of Her Majesty which has been presented by the Mayor of Brighton. I beg to thank you for your kindness in also sending me a copy of the photograph. Yours faithfully, Arthur Bigge. The Manager, The Sculptured Marble Co., 11, Queen Victoria Street, E.C." We understand the Company is sending out a monument in Ravaccone marble for erection at Cape Town.

ARCHITECT AND CONTRACTOR.

The following case comes from Johannesburg:—In the Court of the First Special Judicial Commissioner, the other day, A. Haupt, an architect, sued the Freeman Cohen Consolidated Company Limited, for recovery of £86 for architect's fees. The defendant Company had engaged the services of Mr. Haupt as their architect in connection with a building being put up by them, and it coming to their knowledge, when tenders were called, that the clerk in the office of Mr. Haupt had asked one of the contractors to put £100 on the price at which the contractor had tendered to complete the building, the defendant Company refused to employ the architect further.—The following is the text of Mr. De Beer's judgment: The question to be decided by the Court is whether the defendant Company was justified, on account of information obtained, in cancelling the contract between itself and the plaintiff. From the evidence it cannot be proved that there was any collusion between plaintiff and his clerk, but it is clear that the defendant Company had grounds for cancelling the contract—firstly, because the deception was attempted by a person who represented plaintiff at his office; and, secondly, because there was no possibility that the clerk could profit by his fraudulent conduct without the knowledge of plaintiff. For the rest, defendant Company acted entirely *bona fide* in not making any use of the plaintiff's plans, specifications, &c., and judgment must, therefore, be given in favour of the plaintiff for the sum of £3 10s. as tendered, with costs to date of tender, further costs for the defendant.

MESSRS. A. BOYD AND SON.

Messrs. A. Boyd and Son's "Book of Fireplaces," a copy of which we have just received, claims attention not only as containing a varied and artistic collection of fireplace designs, but because, incorporated in the same work, are suggestions as to warming and ventilating, the treatment of troublesome chimneys, &c. The designs illustrated are chiefly inexpensive varieties of a decorative description, exhibiting in many cases a striking originality, whilst there is a general wealth of artistic treatment which must appeal strongly to a cultured taste. The front cover of the catalogue is adorned with a very pretty design of a Louis XV. fireplace; a more elaborate design of the same period is also reproduced showing special decorated porcelain sides treated in colour or in applied brass work. The effect is richly decorative. Notable among other designs are a register grate with electro bronzed canopy, an engraved brass register grate of Louis XVI. design, with bas relief ornaments, vases, and mouldings, and bright iron covered slips at sides—a very neat pattern—two polished bright grates, one of Flemish design, with bas relief ornaments, projecting canopy, plinths, and mouldings, and the other with brass enrichments on the coves

and on the canopy; a polished black register grate, with decorated tile jambs and frieze, and bronzed bas relief plaque in centre; a register grate of Italian design, with fire-lump body; and lastly, a dog grate in bright iron, the ornaments and other parts in brass. Although the other designs are principally of the Louis XV. and Louis XVI. periods, one or two are representative of the Old English and of the Gothic styles, and merit of design is equalled only by the excellence of material and workmanship in all Messrs. Boyd and Son's manufactures. The firm's works, it may be mentioned, have been in operation for a century, the name of Boyd having become very largely associated, not only with the subject of fireplaces, but also with warming and ventilating and other matters pertaining to the health of the home and of our public buildings, on which subjects Mr. R. W. Boyd is the author of several books and pamphlets.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BOURNEMOUTH.—For new relief sewers in the sea-church and Palmerston roads, Boscombe, Bournemouth. Mr. F. W. Lacey, borough engineer and surveyor:—
G. Troke £2,960 0
Cooke and Co. 2,748 0
S. Saunders 2,622 0
F. Osman* 2,298 0
*Accepted.

BRIDLINGTON QUAY (Yorks).—For the erection of house, conservatory, &c., for Mr. J. Jefferson. Mr. J. Earnshaw, architect, Bridlington Quay:—
W. Hosenard 272 10
W. Moody 636 7
W. Barnes 656 0
E. Corner, Bridlington Quay (accepted) £650 0

BROMLEY (Kent).—For erecting a small villa in Crown-lane, for Mr. W. Watson. Mr. John T. Grubb, architect, Bromley:—
H. Chapman £48 11
T. Hutchings (accepted) 450 0
R. Harmer* £365 0
*Withdrawn.

BURSLEDON (Hants).—For the erection of a bungalow and gardener's cottage, Netley Common, for Col. Perkins. Mr. Norman H. Atkins, architect, Fareham:—

	Gardener's Bungalow.	Cottage.
H. Stevens and Co.	£1,841	£457
T. Rashley and Son	1,686	383
Exors. of the late William Franklin	1,652	394
G. H. and A. Blackman (accepted)	1,425	359

CANTRAY (Inverness).—Accepted for erecting a shooting lodge, for Major Davidson, of Cantray. Mr. Robert Black, C.E. and architect, Inverness:—
Masonry.—Hugh Cameron £719 15 0
Carpentry.—Fraser and Macdonald 835 16 0
Slating.—James Gray and Son 194 9 0
Plumbing.—Mackay and Maclean 266 0 0
Plastering.—C. R. Gallie 236 0 0
Glazing, &c.—Donald Macdonald 88 0 0
Bells and Beams.—Rose Street Foundry Co. 15 12 0
[All of Inverness.] £2,405 12 0

CARDIFF.—For the construction of a service reservoir (3,000,000 gallons), water-tower, keeper's house, &c., Penylan Hill, for the Corporation. Mr. C. H. Priestley, C.E., Town Hall, Cardiff:—
T. W. Ridley £11,984 0 6
J. Strachan 11,064 10 6
J. Allen 10,458 13 3
J. Vevors 10,674 10 6
Turner and Sons £9,450 12 7
H. Gibbon, Cardiff 9,419 0 0
diff* 9,419 0 0
A. S. Morgan & Co. 7,784 18 2
*Accepted.

COLCHESTER.—For the erection of nurses' home, laundry, &c., at the hospital, for the committee. Messrs. Goodey and Cressall, architects, Victoria-chambers, Colchester:—
R. Beaumont £3,544 11
G. Grimwood & Son 3,473 0
E. West 3,400 0
F. Dupont 3,400 0
H. Everett & Son £3,400 0
S. Dobson and Son 3,390 0
W. Chambers, Colchester 3,289 0

DAWLISH (Devon).—For laying about 1,200 yards stone-ware pipes, &c., for the Urban District Council. Mr. J. S. Delbridge, surveyor, Priory Terrace, Dawlish:—
Sanders, Harding & Co. £783 16 2
C. Co. 691 0 0
Grounds & Newton 685 0 0
Mingo and Boone 587 12 0
J. Wescott 558 7 6
Stephens and Son £547 9 4
Thomas 544 16 7
Hawking and Best 529 10 2
Dawlish *Accepted.

ELGIN (N.B.).—For the erection of excise offices, house, and warehouse, Strathpey, for Messrs. J. & G. Grant, Glenfarclas Distillery, Ballindalloch. Mr. C. C. Doig, architect, Elgin:—
Building.—R. J. Mitchell, Huntly
Carpentry.—T. G. Archibald, Huntly
Slating.—W. Leslie, Lossiemouth
Plumbing.—J. Hunter, Elgin
Painting.—J. Kintrae and Son
Ironwork.—Jas. Abernethy & Co., Ferryhill
Foundry, Aberdeen

ENFIELD.—For additions to school, Chesterfield-road, Enfield Lock, for the School Board. Mr. G. E. T. Laurence, architect, 181, Queen Victoria-street. Quantities by Messrs. D. Campbell and Son, 4, Finsbury-circus, E.C.:—
Knight and Son £2,745
J. Chessum and Sons 2,524
General Builders, Ltd. 2,500
P. Bayard 2,289
C. H. Hunt 2,250
E. W. Newman 2,195
J. Smith and Son 2,185
Batley, Sons, & Holness £2,045
G. Wilkinson and Son 2,014
W. Lawrence 1,943
A. Fairhead and Son 1,927
Ponder's End* 1,897
G. Godson and Son 1,875

*Accepted subject to approval of Education Department.
ILFORD.—For erecting fifteen villas in Auckland-road. Messrs. Verleyck and Dunn, architects:—
Messrs. Verleyck and Dunn £4,799 0
G. Lewin 4,417 0
T. E. Mitchell 4,410 0
J. Silcock 4,287 10
Hammond and Sons £3,647 0
F. Almond 3,600 0
F. Willmott 3,409 0

LONDON.—For pulling down and rebuilding No. 1, Little James-street, Bedford-row, W.C., for Mr. H. E. Holmes. Mr. Lewis H. Isaacs, architect. Quantities by Mr. J. F. Bull:—
H. King £1,167
C. W. Patten 1,117
R. E. Worsley and Co. 1,112
H. J. Woodrow £1,095
R. Bristow and Sons* 1,092
*Accepted.

LONDON.—For forming new waterproof cellar, structural alterations, with new front, new drainage and sanitary, and repairs throughout, including trade fittings, &c., plete, to "Collings" off-license beer and spirit house, grocery and provision stores, Neasden-lane, Willems, N.W., from plans and specification prepared by Mr. Art Farmer, of Southfields, S.W., for Messrs. Thorne Bros. quantities:—
Allard and Co. Too late
Cowley and Drake £2,210 0
Easterbrook and Son & Puttick Bros.

MALLAIG (N.B.).—For the erection of business premises for Mr. A. S. Macintyre. Mr. Dun, Cameron, and Inverness. Quantities by architect:—
Wm. Bain Cregarroy, Benbecula £8
MALLING (Kent).—For building a pair of cottages Mr. T. Mead. Mr. John T. Grubb, architect, Bromley:—
W. Brown 308 10
J. E. Grayson* *Accepted.

MORLEY (Yorks).—For the erection of seven town houses (joinery work only), for Messrs. W. and H. Syme Newton and Asquith. £310 0 David Furness
N. Holroyd 308 10
J. E. Grayson* *Accepted.

NEWHAVEN.—Accepted for proposed alterations additions to business premises, High-street, New South, for Mr. J. Bannister. Mr. W. Cooper, architect, Havlock-road, Hastings:—
M. Woolger, Newhaven £4

PONTARDAWE.—For the erection of business premises for Mr. David Lewis. Mr. W. W. Williams, architect, Wind-street, Swansea:—
Walters and Johns £2,170
John Griffiths 1,990
Williams and Davies 1,880
John Rees, Ystalyfera* *Accepted.

PORT AUGUSTUS (N.B.).—For making over a new approach to Glendoe Shooting Lodge, Lovat Es for Mr. Herbert Weld Blundell. Mr. R. Black, C.E. Union-street, Inverness. Quantities by the engineer:—
Chisholm and Co. £1,187 10
R. Fraser 1,092 10
W. Wilson 976 0
Smith and Imry 976 0
Watt and Co. 976 0

SEAFOOD.—For the erection of a country doctor's house, Broad-street, Seaford, Sussex, for Dr. W. P. Morgan. Wm. Cooper, architect, 21, Havlock-road, Hastings:—
J. Simmonds & Co. £2,900 0
C. Moring 2,200 0
S. H. Perry 2,140 0
F. Cruttenden 2,200 0

"EMPRESS" SMOKE CURE.

The "Empress" Smoke Cure has held its ground with constantly increasing sales for many years, and is now widely recognised as the best chimney pot.

Estimates, Price Lists, and all further information will be forwarded on application.

Telegraphic Address: "HENTSCHEL, LONDON." National Telephone, HOLBORN, 169.

WALTHAMSTOW URBAN DISTRICT COUNCIL.

TO GRANITE KERB, &c., AND CONCRETE PAVING MERCHANTS.

The Walthamstow Urban District Council are prepared to receive TENDERS for the SUPPLY of the following:

About 1888 yards run of 12in. by 8in. Aberdeen or Norwegian Granite Kerb.

About 160 tons of 4in. by 5in. and 27 tons of 4in. by 4in. Granite Setts, and about 3440 yards super of 2in. Concrete Flags.

Forms of Tender may be obtained on and after THURSDAY, DECEMBER 16th, at the office of Mr. G. W. HOLMES, A.M.I.C.E. Surveyor to the District Council, Town Hall, Walthamstow.

Sealed Tenders, on the forms supplied, addressed to the undersigned and endorsed "Tender for—," must be delivered at the Clerk's Office not later than FIVE o'clock p.m. on FRIDAY, DECEMBER 31st, 1897.

The Council do not pledge themselves to accept the lowest or any Tender, and reserve to themselves the right to accept a Tender for the whole or any part of the items mentioned in the respective forms of Tender.

E. J. GOWEN,

Town Hall, Walthamstow, Clerk of the Council.
December 6th, 1897.

CITY of MANCHESTER.

The Sanitary Committee invite TENDERS for the ERECTION and COMPLETION of THIRTY-TWO TWO-STORY TENEMENT BUILDINGS fronting a new street, between Cornwall-street and Spittal-street, and EIGHTEEN COTTAGES, fronting George Leigh-street.

Copies of drawings, bills of quantities, and forms of Tender may be obtained on application to the City Surveyor, Town Hall, Manchester, on payment of £5 5s. (which sum will be refunded on receipt of the drawings, and other documents with a bona-fide Tender).

Sealed Tenders, enclosed in the official envelope, and addressed to the Chairman of the Sanitary Committee,

DECEMBER 15TH, 1897.

SEA DEFENCES.*

BY RICHARD F. GRANTHAM,
M. INST. C. E., F. G. S.

(Continued from page vii.)

AT Scarborough the North Sea wall (see Fig. 6), 3600ft. long, was built 1886—1890. The foreshore consisted of a layer of sand and gravel, varying from 5ft. to 2ft. thick, overlying shale which was bared in rough weather. Within twelve months of the completion of the wall, the erosive action of the sea was found in some places to have scooped out the shale to a depth of 3ft. A stone pitched apron, 15ft. wide and 800 yards long, bedded in concrete, was added in 1891.

At Meadfort, Torquay, the sea wall was founded on greywacke, which was so hard that blasting had to be resorted to, and yet the foundations were undermined 4ft. in depth. The sea removed the rock from the face of the wall below the footings, and so altered the character of that upon which the wall rests that what appeared, when the wall was built, to be solid rock, is now a clay shale, which is utterly unfit to support any weight to resist the action of the sea, even for a few hours.

A wall built in steps, such as at Margate (see Fig. 7), while it does not prevent scour in heavy storms, appears to the author to be the best form. The body of water is broken as it strikes the wall so that it is not projected upwards to the same extent, and the return to the shore is retarded, so that scour is diminished.

The foregoing examples have been adduced to show that the foundations of nearly all sea walls, whatever the form of the wall may be where much exposed, yield in time to the resistless scour brought to bear upon them, and the walls are inevitably undermined and the surface of the shore lowered, unless they are protected by groynes.

III. Groynes.—The author stated at the outset that drifting sand and shingle are the most important elements to be considered in preventing the encroachment of the sea. The function of a groyne on the sea shore is to effect the waves so that the shingle, &c., transported by them, may be deposited and retained in the vicinity of the groyne, while the object of the deposition and retention of the shingle, &c., is to gradually raise the level of the beach and foreshore. The height to which it is intended to ultimately raise the

groyne should be so adjusted as while retaining sufficient drift to stop the run of the waves, the surplus may be allowed to pass on for the protection of the shore to leeward. The groyne should be long enough to prevent the sand and shingle passing its lower end too readily, for if too short, the waves, during on-shore gales, drawing the shingle, &c., down from the beach, will carry it to leeward, so as to partially deplete the bay formed by the groyne.

It is often expected that the erection of a groyne will immediately create a beach. But groynes will only arrest that which is traveling along the shore, and they do this at a rate

The effect of the interception of the drift is strikingly seen at the fine masonry groyne, built by the late Sir John Coode, at the east end of the Hastings frontage. On the west side of the groyne a large quantity of shingle has accumulated, forming a safe and extensive beach for the fishermen's boats; but on the east side of the groyne there is deep water, and the rocky shore is bare. The cliffs, however, being high and of rock, no harm is done.

It will be interesting at this point to refer to what has been done, apparently with much success, on the Ligurian coast of Italy. [And here the author quotes from the minutes of

FIG. 6. SCARBOROUGH.

depending upon the supply of the drift. It may be small or great, so that the bay or bays formed by the groynes may not be filled for some years, or they may be filled in a short time, before the beach has accumulated to such a height as to check further inroads of the sea. A series of groynes, for instance, will require a longer time to fill than a single groyne, for the reason that in the former case the bay or bays to leeward need their share of sand and shingle, while, if the condition of the lee side may be disregarded, a single groyne may be built or planked up to its ultimate height very quickly. It is always most important that groynes, if of timber, should be planked up only as the shingle, &c., accumulates against it.

proceedings of the Maritime Congress of 1893.]

"The most noteworthy of all the works undertaken are those on the railway from Genoa to Ventimiglia along the beach at Cornigliano. The beach, the direction of which is E. $\frac{1}{4}$ S., was considerably eroded for a length of about 800 metres by the violence of the waves under the prevailing S.W. wind. Every winter the line was much damaged. An attempt was made to protect the bank by a massive longitudinal sea wall, but the sea gradually undermined the wall, and the structure slowly disappeared in the sand. M. Parodi having been consulted, advised the construction of a series of groynes, and this course it was decided to adopt. From 1884 to

Fig 8.

* A paper read before the Society of Engineers.

FIG. 9. DYMCHURCH.

1892 four groynes were constructed, covering a distance of about 550 metres, and at respective intervals of 103, 248, and 195 metres, and lengths increasing from west to east of 30, 65, 70, and 112 metres, with a depth of water at the head from 3.25 to 5 metres.

"After the execution of these works the railway received no further injury. The diminution of the beach was stopped, and at present there is every tendency to increase, the submerged slope being silted up, small banks forming at each groyne, and a beach 50 metres wide being deposited on the eastern side of the groyne nearest to the mouth of the Polcevera, from which most of the material is conveyed.

"The effect is less conspicuous on the other groynes; and it is evident that this groyne, which is of much greater length—112 metres—than the others, and extends into a depth of 5 metres of water, projects too far relatively to the neutral line of the south-east waves, which chiefly bring the suspended materials to the beach from the Polcevera, and which has a maximum height of about 2 metres. This groyne, therefore, checks the regular spreading of the material, and hinders the filling up of the beach on the western side of the structure."

The conclusions arrived at by the Italian Maritime Hydraulic Engineers are:—

"1. Groynes are the best form of structure by which a beach can be protected from erosion, provided that there is a sufficient quantity of suspended material brought to shore to replenish the surface.

"2. If it is required to raise or extend any length of beach, the groynes must not be carried out too far, i.e., they must stop short of the neutral line, corresponding to those waves that cause the greatest amount of materials to move along the beach.

"3. If it is desired to increase the beach at one point only, or for a relatively short distance, it is necessary to construct one groyne of sufficient length to extend beyond the neutral line.

"4. As it is often difficult to determine which are the waves that cause the maximum quantity of material to move along the shore, it is advisable to curtail the length of the groynes until experience has shown for each one individually to what extent it is necessary to prolong them.

"5. As groynes should be able to withstand any yielding of foundation without damage, it is better to construct them of rubble stone than of masonry or concrete."

It is important to observe that on the coast referred to the rise of tide is very small, and, as it appears, the material transported by the waves is derived from the matter brought down by the rivers discharging into the Gulf of Genoa. But the evidence afforded by a perusal of the paper from which the foregoing extracts have been made seems conclusive on the points.

- 1st, That the drifting of the materials along the shore is caused by the wind waves, and
- 2nd, That in certain situations groynes are better adapted to protect the coast than a longitudinal wall.

The timber groynes built by Mr. R. Pickwell, at Withernsea, on the Yorkshire coast, in 1870-1871, by arresting a large quantity of shingle and sand, stopped the erosion of the cliffs and the overflow of the sea on to the low-lying land. The trend of the coast there is north-west, and there is no great projecting point or harbour to intercept the passage of the great quantity of drift derived from the waste of a long length of coast. The groynes varied from 300ft. to 350ft. in length, and were fixed 200 yards apart, at right angles to the coast line. The top ends were fixed 12ft. above H.W.O.S.T., and the lower end 6ft. below that level, or from 3ft. to 4ft. above the then surface of the shore. The top five rows of planks were added only as the beach grew. The groynes, when completed, stood from 8ft. to 10ft. above the level of the high beach, and from 4ft. to 6ft. above that of the lower beach. In 1876 four of the groynes at the south end were completely buried, and the other two for two-thirds of their length. The ordinary high water spring tide mark was from 50 to 80 yards further seaward.

For some years the author's firm has been engaged in constructing timber groynes on

FIG. 7. MARGATE.

the south coast, particularly in Middleton parish, east of Bognor, and between Lancing and Shoreham, over a length of coast about two and a half miles. The coast line at the former place faces nearly due south, and at the latter S.E., and both are exposed to the full force of south-west gales. At Middleton the shore, for want of adequate protection, had become almost entirely denuded of shingle when the author took charge. The supply of drift is not large, as quantities are deposited and retained opposite Pagham Harbour, about six miles to the west, under the lee of Selsea Bill. The groynes erected in 1889 and 1890 have arrested a large quantity of sand and shingle, so that the property, part of which is below the level of high water spring tides, is now protected as far as the groynes extend. At Lancing there is a fair supply, as, except the Worthing groynes, practically there is little to intercept the drift between it and Middleton, a distance of about thirteen miles.

The general design of the groynes at these places is similar to those erected by Mr. R. Pickwell, although they differ in details. They are about 270ft. to 300ft. long, and from 400ft. to 500ft. apart. The height at the top

end is 8ft. above H.W.O.S.T., and at the lower end 10ft. below that level, or when first fixed, from 3ft. to 4ft. above the level of the shore. Similarly to a portion of the length of the coast with which Mr. Pickwell had to deal, the beach both at Middleton and Lancing forms a bank or ridge of shingle, which protects the low-lying land behind—in the case of Lancing about 600 acres. In storms these ridges were swept back, and the sea was encroaching opposite the village of Lancing at the average rate of about 18ft. per annum. The top of the ridge from Lancing to Shoreham for about two miles in length varied from 7ft. to 9ft. above H.W.O.S.T. In either case the expense of a sea-wall or any breastwork which would have also involved groynes was not to be thought of, as except opposite the village of Lancing, the land to be protected was agricultural.

The first set of groynes (see Figs. 8 and 11), 16 in number, between Lancing and Shoreham, was erected in 1876—1877. In addition to the groynes, a small shingle bank, the top of which was 3ft. wide and 10ft. above H.W.O.S.T., was formed from 30ft. to 50ft. back from the upper ends of the groynes along the top of the shingle ridge, to stop the run of the spent waves in strong gales. These groynes and bank have for the last twenty years entirely prevented further encroachment of the sea, which in 1876 seriously threatened the property. In 1892 the author's firm constructed a set of groynes further west, commencing at the west corner of the well-known gap in the road between Lancing and Worthing; and in the present year, the first set of the groynes having become worn out, they are being replaced by new ones. The width of the top of the shingle bank in the last two cases has been made 10ft. instead of 3ft. All these groynes are erected on the same principle, the direction of the old set pointing S.E. by S., and the new S.E. In this respect they differ essentially from the groynes built by Mr. Pickwell, and from the practice on other parts of the coast.

Seeing the conflict of opinion upon this point, the author may be permitted to advance some considerations respecting it. The view he holds is by no means new, but it has been tried and found successful.

The late Mr. John Thornhill Harrison, after much practical study of the subject of the motion of shingle, sand, &c., on the English coast, recorded in 1848 his opinion that "a groyne run out in a slanting direction from the prevailing winds appears the most favourable. The power of the prevailing waves to sweep out the shingle from behind the groyne and to carry it forward would be much diminished, and they could only act on the beach some little distance beyond the groyne. On the other hand, it would encourage the accumulation behind it of shingle driven by the waves from other quarters, whilst, as these impinged on the groyne on the outer side, they would exercise considerable power in carrying the shingle back."

In the following year Mr. Harrison emphasized this opinion, as follows:—"The run of the tides produced very little effect upon the beaches at Dawlish and Teignmouth. The waves were the chief cause of the shingle

FIG. 10. NEW ROMNEY LEVEL.

shifting, and as the south-west was the prevailing wind the waves raised by it drove the shingle along the coast to the eastward, causing an accumulation against the western side of the groyne, and, unless they were carefully placed, laying bare the eastern side to the foundation and causing a run along the wall or coast they were intended to protect. The direction of the groynes should be at a considerable angle to that of the prevailing winds, so as to allow the waves spreading out like a fan, and so depositing any shingle that might be carried with them."

Lieut.-Col. Gordon, R.E., in 1853, after ten years' observation of the coast at Eastbourne and Hythe, came to the conclusion that groynes ought not to be constructed perpendicular to or in immediate contact with the work they are intended to protect, but that they ought to be *en echelon* to the periodical high seas and winds; that is to say, the sea should strike upon and wash over a groyne in an oblique direction, with the obtuse angle formed by the groyne and the wave on the land side, so that the sea on its recession should leave the ejected sand and shingle on

stone wall is backed by an earth bank, which defends the low level of Romney Marsh from overflow by the sea. In 1894 Mr. Mathews and Sir Wolfe Barry reported on the state of the wall, which was then in a dangerous condition, and recommended the construction of a number of timber groynes along the frontage. From the bad condition of a considerable portion of the width of the lower portion of the pitched slope, Mr. Case removed a good deal of it, and temporarily constructed concrete steps, with a concrete toe a short distance down the slope. He subsequently erected long, low groynes on his system, commencing at the foot of the shortened slope, and adding to the height of the groynes as the sand accumulated. He thus raised the level of the foreshore in some places as much as 8ft., in this way quite protecting the pitched slope. When the author saw the shore it formed a fine stretch of sand.

There is no stone pitched slope or wall on the New Romney frontage (see Fig. 10), the beach of which has its top from 6ft. to 7ft. above H.W.O.S.T., sloping at an inclination of 1 in 9 down to a flat foreshore of sand having

The mode of construction of Mr. Case's groynes is fully described in the specification of the patent, and appears simple and inexpensive. The author has not yet seen this system applied to a coast exposed to the full force of gales from the prevailing quarter, but he agrees with Mr. Walmisley that the groynes should be carried up to the full of the beach, where there is no stone-pitched slope or wall to protect the frontage.

The points to which the author desires to invite especial attention are:—

1. The protection of the coast line is in most cases dependent on the sand and shingle that can be arrested and retained in front of it.
2. Groynes, unless there is a foundation of rock, are in most exposed places indispensable, whether there is a sea wall or not.
3. Where there is a sufficient supply of drift along any part of the coast, groynes alone, if properly planned, will prevent further encroachment without a sea wall or breast-work.

In support of the second point he has brought forward the examples of the frontages

FIG. 11. LANCING.

the opposite side of the groyne. The diagram illustrating Lieut.-Col. Gordon's paper shows the direction to be an obtuse angle of about 103deg. with the S.W. wind.

As will be seen, the direction of the groynes at Middleton and Lancing has been laid consistently with the conclusions of these authorities. After twenty years' experience, the author is satisfied that groynes laid in such a direction are more effective in accumulating and retaining drift than those laid in any other.

Mr. Edward Case, A.M.I.C.E., has designed and patented a system of groynes differing in mode of application and detail from the examples already described, and has adopted them for the preservation of the Dymchurch wall, and of the frontage of the New Romney Level. The shore from Romney Hoy to Dymchurch trends to the north and north-east, and is under the lee of Dungeness, so that it is sheltered from the south-west gales. The wind which drives in the sea with the greatest effect on that shore comes from the south-east. Here only sand seems to be accumulating on the foreshore, the greater part of the shingle being intercepted by Dungeness. Mud has hitherto collected on the shore, and a deposit of mud is shown on the Admiralty chart close to the north point of Roar Bank at a depth of 2½ fathoms. From this circumstance it does not appear that strong currents prevail, nor that there can be so much scour along that part of the coast as at other points.

The Dymchurch wall has already been referred to, and its front slope described. The

an inclination of about 1 in 60. At the back of the beach there is a breadth of sand-hills, which, although the sea has encroached upon them at the rate of 8ft. per annum, prevent overflow on to the low land of Romney Level. On this foreshore a good deal of sand has already been accumulated by the eleven groynes put up by Mr. Case, each of them 420ft. long and 500ft. apart at right angles to the coast line.

It may be remarked that Mr. Case differs from other engineers not only in detail, but in commencing the upper ends of his groynes at the level of Ordnance Datum, or about 10ft. below H.W.O.S.T., or approximately at the foot of the steep slope of the beach where the flat foreshore begins, and extends as far out to low water as practicable—that is to say, he begins his groynes where, in most cases, they leave off. The upper part of the beach is therefore for the time left unprotected. The sand on the foreshore accumulates at the rate of about 2ft. per annum against the groynes, which are not raised more than two or three deals above the shore. In this way Mr. Case expects to gradually raise the foreshore for a long distance towards low water, and with it the level of the beach, and so diminish the depth of water and the power of the waves to scour and encroach.

Mr. A. T. Walmisley considers that groynes should be carried up to the top of the beach. He says: "It is very essential to the success of a groyne that the sea, not the beach, may wash over the top in rough weather, and that it be carried well up into the full of the beach."

of Brighton, Hastings and Seabrook, and no doubt others could be mentioned.

The third point he has illustrated by the examples on the Italian coast, at Withernsea, Middleton and Lancing, to which may be added the frontage of Worthing, which is entirely protected by groynes without a sea wall.

It is almost needless to say that the great hindrance to the adoption of any kind of effectual protection against the encroachment of the sea, except for residential property, is the cost. No frontage of agricultural land, except where a considerable area is below the level of high water, can bear the cost of any substantial form of defence hitherto devised. It is cheaper to sacrifice the land.

If Mr. Case's system admitted of general application much might be done which so far has not been possible. The cost of such defences falls entirely upon the owners of the frontage, the owners of the back land being content to wait till they in turn become liable. Manifestly the whole burden of liability ought not to be thrown upon the frontagers while other owners escape scot free, although it would be difficult to devise a graduated scale of rating to meet the case.

The question is a national one, and the Government is much interested in the matter. Coast-guards stations, as well as other works, are established every two miles or so along the coast, and the abandonment of the stations and their re-erection further inland owing to the encroachment of the sea are of constant occurrence.

IN WESTMINSTER ABBEY.

ON Thursday last, the 16th inst., John Loughborough Pearson, "Surveyor of the Fabric," was buried in Westminster Abbey. What place could have been more fitly chosen for his last sleep? He had had the charge of the structure for many years. His best skill, his unwearying care, were ever at the service of our national fane. Repairs under his direction were even now in progress. Quietly and simply, without pomp or circumstance, as befitted one who in

Schubert; as the procession moved up the nave and choir, the opening sentences were chanted of the office for the burial of the dead. The choir filed right and left into the stalls, the clergy passed on to the high altar, while the body was deposited at the steps of the sacarium, with the pall-bearers and mourners on either side. After a psalm, the sub-dean advanced to the top of the steps and read the lesson, which was followed by an anthem. Then, while a hymn was being sung, the procession was re-formed, and the body carried to the grave, which was beside those of his brother artists, Barry, Scott, and Street. Here a group was formed round the open grave, while the sentences of the committal and the benediction were pronounced by the Dean. As the last words died away, and the Dean stood looking into the grave, the mournful strains of the Dead March rose and trembled through the building, and as it grew stronger and fuller, and then finally rang out its assurance of ultimate triumph, they turned away and left him, "in sure and certain hope," to the company of those who had gone before. It was his fate to encounter strong and often angry opposition to much of the work which he carried out

An Architectural Causerie.

"Cardiff" and
the Art of
Assessing.

THE only fault one has to find with one's predominant partner is that he is inclined to be a little too predominant. He has of late, in particular, been behaving in a riotous and overbearing manner upon the subject of the Cardiff competition awards. He even broke a palette in emphasising some of his extremely commonplace ideas upon the subject. All one did was to tell him he did not know what he was talking about, and that it was evident he was annoyed because younger men than himself had had it all their own way; and the predominant partner did not like it. He upset a bottle of ink, and inquired in a high key of indignation how he should come to have personal feelings when he had not even competed. From that he went on to complain of "the indecent haste" shown by the authorities, and grew pink with the intensity of his fervour and broke a second palette. One merely smiled, and reminded him that one

CORNER AT LISIEUX. DRAWN BY W. A. MELLON.

life had been simple and unassuming, the last office of the Church was performed in the presence of friends and colleagues. The architect's fame rests not on popular applause, "nor in broad rumour lies"; so here were no crowds of the curious, but just a few who knew him and respected him—brothers in Art, comrades of the Academy and the Institute, members of the Chapters of cathedrals under his charge, and of societies to which he belonged. The Dean of Peterborough, the Sub-dean of Lincoln, the Presidents of the Academy and the Institute, the Bishop of St. Andrews, and the Commissioner of Works under whom he added to Westminster Hall, were among those who bore the pall. As the body was received at the west cloister door by the clergy and choir, a voluntary was rendered from a mass by

at the cathedrals under his control. Rarely in our day does the clamour of controversy rise so loudly as it did over Peterborough. Never has any work of restoration met with so fierce a resistance, and now—while the din of conflicting passions and the echo of angry voices are still ringing in our ears—he has passed to where beyond these voices there is peace. By his open grave, nought can be remembered but the long life laboriously and faithfully spent in the service of his Art. Those most opposed to the policy which he carried out can join here in a common tribute of regret for our loss, and of respect for the sincerity of his character and convictions. To all of us, the memory of John-Loughborough Pearson is that of an accomplished architect and an honest man.

went shares in the palettes and the ink, and mentioned that his own violent exhibition of jealousy was distinctly the most indecent spectacle one had ever witnessed. The fact is that the predominant partner, though he does not like it to be mentioned, is getting on in years, and the Conservative inclinations of his youth are developing into the prejudices of the rabid Tory. Already he holds tenaciously to the old-fashioned notions upon all subjects, and persistently opposes anything that may appear to him to contradict them. Thus it is that he has altogether failed to realise what are the true vital qualities that distinguish and mark a capable assessor, although one has told him that the thing is now established beyond dispute. He still holds to the old hum-drum ideas, and not only denies that speed is the chief recom-

commendation of an assessor, but, in the heat of controversy, has committed himself so far as to declare that swiftness of decision has no part in the making of a just award, and he asserted further that the cases of the "lightning barber" and the "quick change artiste" were not analogous, and that their popularity did not imply the advocacy of a "lightning assessor." If one eliminates the expletives and outbursts of passion which disgraced the predominant partner's utterances upon the subject of "Cardiff," it would seem that he complains in chief of the distinguished and popular architect who acted as assessor in the late competition. He holds that even if long experience and a notorious ability have granted him such supreme mastery of the intricate questions of fitness as are involved in the plan and elevations of a large and important public building, so that he can, by a cursory glance, definitely decide the relative merits of the better part of a hundred designs, comprised in some six hundred sheets of drawings, and which have occupied some of the most brilliant of the younger men, and some of the best established authorities and specialists among the older, months to elaborate, at least, the predominant partner insists, the assessor's proper sense of modesty and courtesy should prompt him to remember the feelings and sensibilities of his brother professionals, and show him that the graceful and the becoming act (if not the obligatory), would be to throw a plausible glamour over the method of his assessment, such as would indicate a thoughtful and judicial survey of the designs and the exercise of a careful and nicely balanced judgment in the final placing of his awards. The predominant partner added some violent words to the effect that the Cardiff awards were settled by the chance of which side of his bed the assessor got out at in the morning. Of course, one told him that an assessor was a tried man of long experience, and that physical conditions had no effect whatever upon the brilliancy of his mind, which shone like a fixed star, and was necessarily undimmed by any indisposition which did not absolutely prostrate him. To one's surprise, one's predominant partner said "Bah!" He seemed so fixed to these entirely unreasonable views of his upon this subject, that one took some pains to explain things to him and set him right. One told him that he must bear in mind the dignity of the Profession; architects were willing to sacrifice petty feelings of their own as long as the dignity of the Profession was upheld, and that some of them took the trouble to graduate at one of the Universities, that they might uphold it by putting B.A. or M.A. on their notepaper. An assessor who assessed with dash and daring, and with possibly a smack of devil-may-care, and with a speed and brisk alacrity which advertised his complete confidence, provoked admiration in the mind of the British Town Councillor (who only knows about Architecture after the assessor's award is made), and thus raised the dignity of the Profession, and gratified other architects even though they might think the merits of their designs had not been fully appreciated. Then, again, one reminded him that an architect's assistant was indeed paid by time, but an architect or an assessor were paid by the job. That made all the difference. It was the assistant's art to take as long as possible, but an architect's and an assessor's business was to be quick. If an assistant could contrive to cut his finger as he sharpened his pencil he knew, while he bathed the injury, that all the time he was earning honest gold; but an architect or an assessor would be a fool and a bungler to do any such thing. It was therefore the whole art of the assessor to be as quick as possible, and the quicker he was the better assessor must he be. None could complain that the assessor of the Cardiff competition had not been quick enough. One told the

predominant partner with confidence that the record had been broken, though, of course, one only guessed it. There are several reports, but one will do all justice to Mr. Waterhouse and credit—that which states that the drawings were sent in on Saturday and opened on Monday; that the assessor viewed them on Tuesday and handed his report to the Town Clerk on Wednesday. On Friday, the result was in the London daily papers, and on that morning, the Western Mail published an elevation and plan of the accepted design. One invited one's predominant partner to say what more he could expect, considering how recent an innovation the general employment of an assessor was. He offered no remark, but continued industriously to collect our ink upon the table and conduct it back into the bottle with a funnel of paper. One concluded by anticipating that about the year 1950 the assessment would be a special proviso in the Profession, and each assessor a lightning one. The drawings would be arranged in a suitable gallery, the Town Council would meet, and at a specified hour, the assessor, just arrived by train, would be injected through a door into the gallery. Various reporters of the sporting and other dailies would be in attendance with stop-watches. After a few minutes, or possibly seconds, there would be a brief hail from the gallery, and at the signal the members of the Town Council would burst in to find the assessor in a state of physical collapse, but with the selected designs arranged before him upon the table, and his report written. One pressed this picture upon one's predominant partner; but, to one's surprise, he only repeated his previous ejaculation of "Bah!" B. C.

No one would recognise Lilong now. Of late he has grown stout, and, as he walks from his lately acquired suburban residence to the wayside station, you feel that the trim trousers have but shortly left their stretching frame, and that the creases faintly seen in his well brushed coat are but symbols of nightly foldings sanctified by custom. This morning he is more than usually cheerful, and a flower dons his button-hole. Yesterday he was instructed by the Vestry to prepare plans and specifications for the new Swimming Baths, and to-day he is hurrying to his city office to insert an advertisement in this week's building papers for a draughtsman well versed in bath work, and to inform his third man that his services will hardly be required after next week, the foundation stones of the new chapel having been laid by the Mayor of Soutperton some three weeks ago. Much business has brought a brusqueness into his once gentle voice, for he circulates in the city whirlpool—a shuttlecock sent hither and thither by unseen forces as strong as that which sets the weathercock in motion. That is Lilong now. And yet it seems but a short time ago that he occupied an office on the third floor in Bedford Street, when every enthusiastic youth that gathered round his hospitable board imagined that Lilong in the near future would be numbered among the Master Builders. But, alas! How are the mighty fallen! To-day he is a well established but crusty city architect, in league with speculative builders and such like, good at driving a bargain, and overworking his underpaid assistants. No one hears any discourses now upon the "great ideas" that seized him about planning, nor do you find upon his drawing board, as of old, any schemes for a pier with new methods, perhaps, of driving in the piles. He was very interesting, and in those days his cool and impartial attitude of mind enabled him to approach his work from almost any stand-

point. Languid and indifferent, as he seemed, he could, when necessary, bring to his task a fierce and furious energy that surprised even his most intimate friends, and caused his enemies to view with apprehension the use of a quality they little suspected to exist. Lilong in his most popular period had his enemies, a strong desire to take an impersonal view of questions at issue, combined with a hatred of thought and emotion, bordering on the maudlin, made him disliked by the superficial and sentimentally inclined. He objected to weeping with Sterne and those like him over dead asses, and few can forgive their best friend who forgets to weep over the favourite but dead ass. He would prefer to assist a young and budding architect to find his footing than to put his hand in his pocket to help a dilapidated draughtsman never likely to retrieve his fortunes. His chambers in Bedford Street was a meeting ground for many aspirants to architectural fame. Here was one who came to talk of his failures, and anathematise those who unwittingly overlooked him; here another, silent but observant, whose reputation was based upon the things he left unsaid rather than by any remarks he let fall from time to time; others there were and plenty; and then the long and slim host. Who that knew him can forget his oratorical flights, his real and unfailing kindness of heart, and his ready resource in making visitors at ease? Picture him for a moment, in his shoes that were always a size too large for him, moving about the room next the office—one moment assisting his "friends" to tea or cake, the next hovering over his office drawing board in search of a paper, chipping in from round the edge of the office door with some pertinent remark on the dockers' struggle, or striking in with a few bars of some old music hall song, rendered like a humming-bird. He was no modern Don Quixote tilting at windmills, nor could he be described as a "dreamer of dreams," but why does he now sit in his city office twiddling his watch-chain, the apotheosis of common sense and the commonplace? In justice to him let it be said that the drains of the houses he builds seldom go wrong, nor does the rain come through the roof. This is as it should be, for he has become a practical man, but dull—very dull. G. LL M.

THE ARC DE TRIOMPHE.

LIKE the Pont Neuf, some years ago, that magnificent memorial of Napoleonic glory, the Arc de Triomphe, has been sadly vilified. There has been some stir in the French capital of late regarding the condition of the famous archway, which is so dear to all Frenchmen, and which is a source of attraction as a monument to all visitors to Paris. It was rumoured that it was crumbling to pieces, that it might fall in at any time and cause a crash, the noise of which would be heard all over Paris. The great arch was said to have been rendered perfectly rotten by the rain and the storms of years, and a thorough restoration of the monuments was called for. Though there was some ground for directing the attention of the authorities to the historic relic, it now transpires that much of the rumour was utter exaggeration, and there is no fear among experts that the Arc de Triomphe lacks solidity. It lifts its front as proudly as ever in the dark December skies, and it will continue to do so for centuries to come. It has had to be repaired, like all other Paris monuments, and it is true that one of the arches was in a bad way owing to the infiltration of water. That damage has been remedied by the application of fresh concrete to the affected parts, and by the collocation of slabs on the upper part of the memorial over the vitiated vaulting. The works of restoration have not yet terminated, but nearly all the scaffolding has been removed, and the only woodwork remaining is that necessary for the slabbing operations.

CARDIFF COMPETITION.

NEW TOWN HALL AND LAW COURTS.

SINCE the competition for the Sheffield Town Hall, no open competition has evoked so much interest in the Profession as the one at Cardiff, just adjudicated on by Mr. Waterhouse, R.A.

The magnitude of the scheme and the fairness of the conditions would perhaps have procured an even greater response on the part of architects were it not for the unusually short time allowed competitors to prepare designs. As it is, several well-known architects who might have been expected to compete have been unable to send in designs.

The proposed site, Cathay's Park (which is to be sold by the Marquis of Bute to the Corporation), is divided by a double avenue of trees into two portions: the smaller to the west of the avenue, and bounded by the North Road; the eastern, or larger portion, bounded by Park Place.

From Park Place to the North Road a new road was suggested, and frontage lines were laid down, that for the Law Courts having a maximum width of 200ft., and that for the Town Hall, 450ft.

The conditions stated that the police courts and station were to be entered from the North Road, the Assize Courts and Town Hall naturally fronting on the projected road. It was suggested that the assembly, reception hall, and council chamber should be arranged *en suite*.

The great majority of competitors have naturally assumed that the principal front of the Town Hall should be the largest one, and should be placed in the centre of the 450ft. allotted. With very few exceptions they have also assumed that the suggestion as to the council chamber, reception and assembly rooms should be taken as indicating the lines on which the buildings were to be planned.

In the winning design—by Messrs. Lanchester, Stewart, and Rickards—the Town Hall is kept to the western side of the space allotted next the avenue, with a long front to the latter and a frontage of only 250ft. to the avenue, and the principal front of the Law Courts is placed along the avenue. The *en suite* arrangement of the State rooms of the Town Hall is also abandoned.

There is a somewhat natural feeling that these points should have disqualified the design, but apart from that point it must be admitted that the plan of the Town Hall is an exceedingly able one, every part of the building being well lighted, the offices well and conveniently grouped, the approaches to the assembly-room excellent as to entrances and exits. The fact that both the reception and assembly halls are lighted into courtyards, and that the council chamber is the only relief in external elevation to an immense range of two-storied offices, are weak points in the design, and, architecturally, the fact that there is no single State staircase is a blemish.

The arrangement of lavatories and cloak-room accommodation, and the position of council, waiting, and private members' rooms, seem specially well considered.

(Our illustrations of the premiated designs in connection with the Cardiff Competition will be concluded in our next issue.)

The large Rates office is situated under the assembly hall, and is approached from each side and from the main hall.

A sub-basement at the north end contains the strong rooms and Weights and Measures department, but otherwise the building is two-storied.

If it be not a radical mistake to put law courts on a first floor, the winning design is generally well planned. Exception must, however, be taken to the converging staircases leading from the Assize Courts to a small and cramped hall, from which there is but one exit. The arrangement of the first floor is, however, admirable. The hall is well placed, and the witnesses' and barristers'

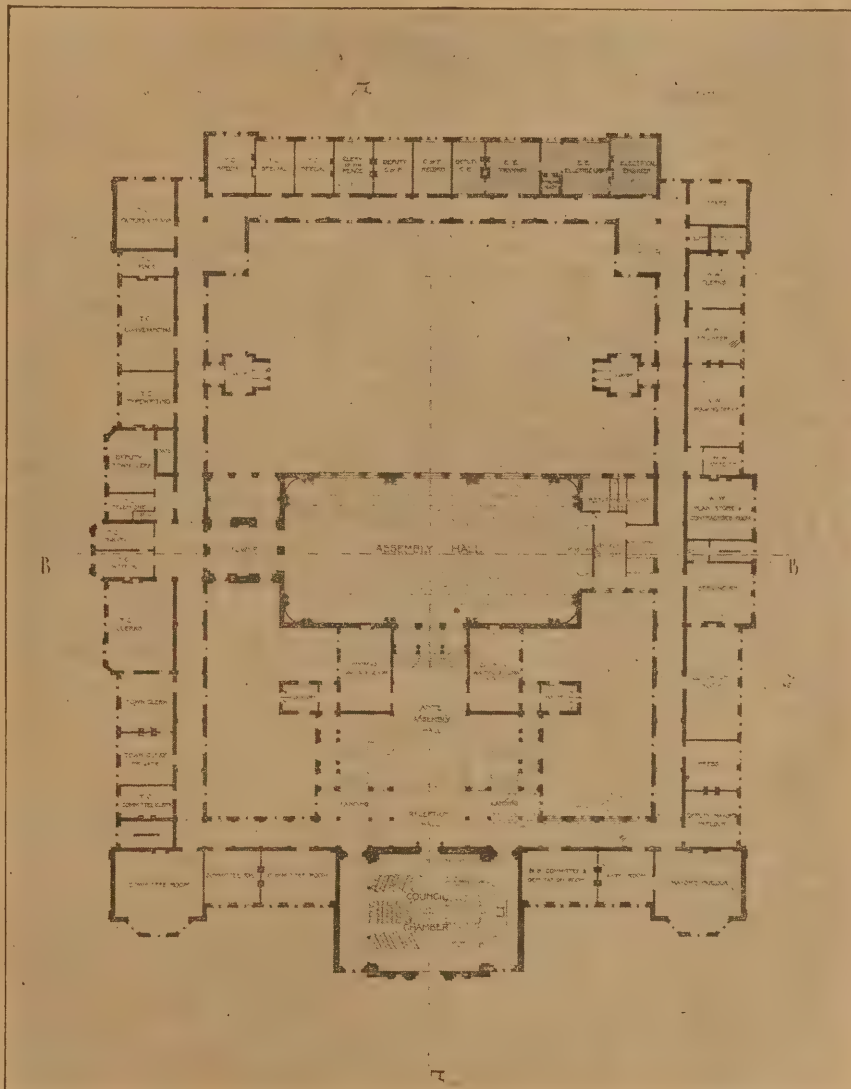

treatment generally is of a simple English Classic character.

The authors cube their Town Hall at 11d. and the Law Courts at 10½d.

The second premiated design, that of Messrs. Gibson and Russell, is illustrated by the most striking set of drawings in the room, the sections and detail being beautifully finished in colour.

The authors have been unusually successful in compressing their cubic contents, 11½d. a foot being provided for the Town Hall and 11d. a foot for the Law Courts, whereas Messrs. Leeming and Leeming cube their Town Hall at 9d. and Law Courts at 7d.

The type of plan followed by Messrs.

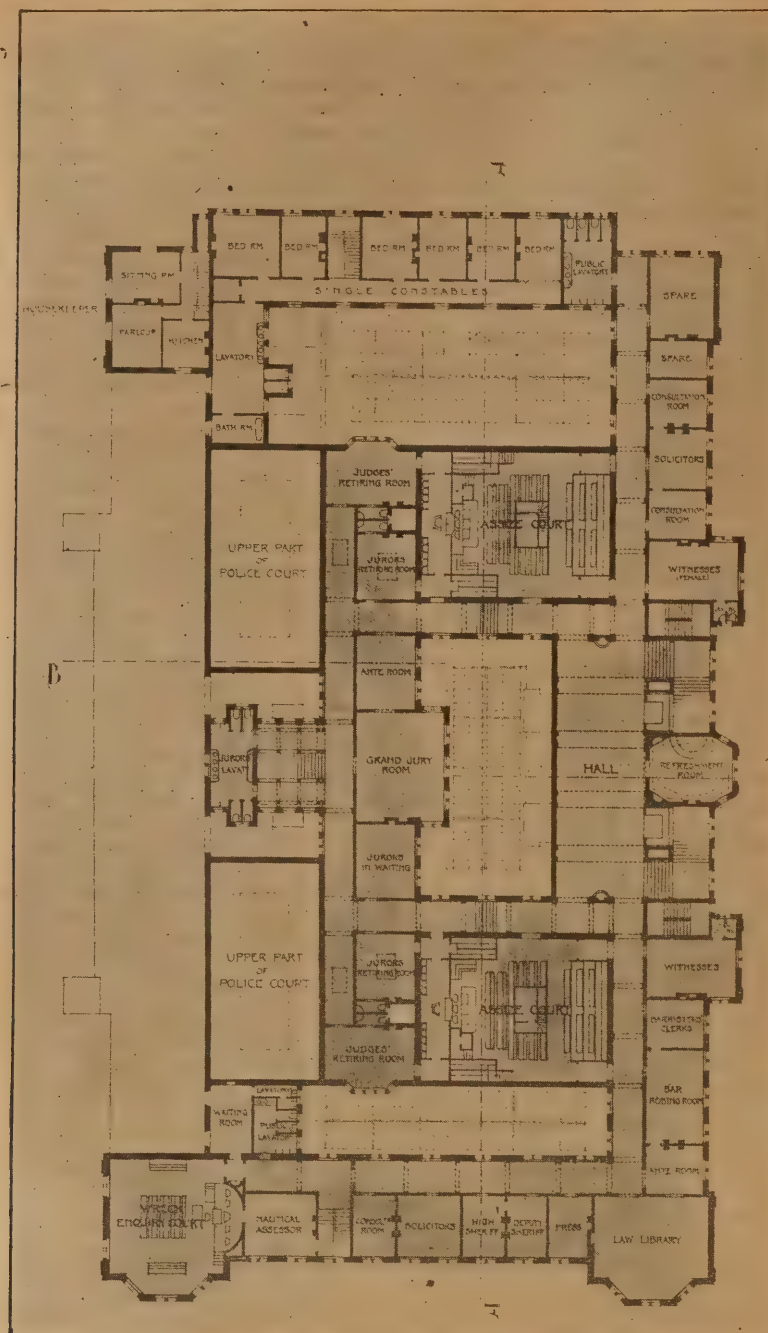

CARDIFF COMPETITION. FIRST FLOOR PLAN OF TOWN HALL. BY MESSRS. LANCHESTER, STEWART, AND RICKARDS.

rooms conveniently and well arranged. The judges' and magistrates' entrance from the western front is very suitably arranged, as are also the Police Courts, with the exception that the consulting rooms for the Bar and solicitors are placed at the end of one police court, instead of centrally between them. In the police station the principal fault to be found is that the parade room is partly underneath one of the courts.

The elevational treatment of both buildings seems somewhat commonplace, which is, however, in some measure doubtless due to hurried drawing. The squat dome over the council chamber is especially objectionable, and the tower needs a complete remodelling. The

Gibson and Russell, Milner and Allen, Leeming and Leeming, and several others is almost similar—that of a double quadrangle, the longer front being along the frontage line, the grand staircase occupying part of the central block and the three principal rooms *en suite*, and facing the south with the various offices round the three remaining sides and under the broad front block. There can be little doubt that this plan is the most logical outcome of the conditions; this cannot be said of the first premiated design.

Its inevitably weak point is the difficulty of effectively lighting the broad front block, and this must be the point which mainly influenced Mr. Waterhouse to making his award.

CARDIFF COMPETITION. FIRST FLOOR PLAN OF LAW COURTS. BY MESSRS. LANCHESTER, STEWART, AND RICKARDS.

Messrs. Gibson and Russell have split up several of the larger departments in an unsatisfactory way, otherwise their plan is ably worked out and the rooms well arranged.

The arrangement of small octagonal halls at the angles of main corridors is very effective. Messrs. Milner and Allen also make a similar feature, but in their design the halls communicate with four octagonal staircases which, with the grand staircase, give access to the various floors.

Messrs. Gibson and Russell place their three secondary staircases opposite the centre of the east and west wings flanked by lavatory blocks, while the third staircase is similarly placed back to back to the grand staircase.

With the exception of the defective lighting of the front block (a point which Messrs. Milner and Allen have partly obviated by placing the large rates office on one side of the main entrance), Messrs. Gibson and Russell's design is, we consider, better than the first premiated design, and has more architectural possibilities in it.

The Law Courts block is well and compactly arranged, but in this case the Police and Wreck Enquiry Courts are placed on a first floor, and the Assize Courts on the ground level.

Facing the south is a large hall, in front of which are a low range of consultation and witnesses' rooms, flanked by low towers containing stairs up to public galleries at either end. Immediately facing the main entrance stretches a broad hall corridor with the Assize Courts on either side. This is crossed by the judges' and magistrates' corridor, beyond which are similarly placed the two police courts. A broad corridor running across from east to west, flanked by staircases, give public access to the police courts, the entrance to one of which, being from the avenue, is contrary to the conditions laid down. On the north side of the corridor are the rooms for solicitors and witnesses, beyond which is an area which forms on the lower level a glass-roofed parade room. The housekeeper's and single constables' quarters are arranged in a block next

the parade room. Outside the two police courts are narrow areas for light, and secondary corridors with which the wreck enquiry and police rooms open. The refreshment room, law library, and other rooms are similarly placed with respect to the Assize Courts. The lower floor is well arranged, though the row of cells looking over or into the parade room may be objected to.

The architectural treatment of both buildings is somewhat similar to the author's West Ham design, but is far more picturesque and better handled. It is, however, somewhat lacking in dignity and restraint.

The halls and staircase of the Town Hall are lined with marble slabs, the great rounded end of the grand staircase being lit by a range of small openings separated by shafts.

The treatment of the assembly-room is rich in the extreme. The walls are divided into bays by stone columns having high dies, while the intervening spaces are panelled up to two-thirds of their height. A barrel ceiling surmounts the whole with flat panels at the sides and columned posts resting on broad tiebeams. The design of the main or southern front loses in dignity, being treated as a two-story block with a double range of windows.

The third premiated design—by Messrs. Cooksey and Cox—evidently owes its position to the planning of the Town Hall, as that of the Law Courts is bad in many ways, and has certainly little to recommend it in any way.

The plan of the Town Hall is, however, an excellent one, and utterly unlike any other in the room.

Flanking the central entrance, from which access is obtained to the state rooms, are two carriage ways leading to an internal court, round three sides of which are disposed the offices, entered at the two internal angles of the quadrangle. By this arrangement the whole of the state rooms can be cut off from the rest of the building, and the entrances can all be controlled with great ease. The elevations of both Town Hall and Law Courts are treated in a very happy manner, the style adopted being reminiscent of Wren.

(To be continued.)

THE Dean and Chapter of Truro have agreed to the proposal that the memorial to the late Archbishop Benson, by those who were ordained by him, should take the form of a brass in the Cathedral.

A BUST of the late Sir Charles Hallé has been presented to the Manchester Art Gallery Committee of the City Council by Sir W. H. Houldsworth, Bart., M.P., on behalf of the subscribers to the Sir Charles Hallé Memorial Fund. The bust, which is of white marble, is the work of Mr. Onslow Ford, R.A.

The acquisition of property in connection with the Blackwall Tunnel scheme cost £357,520 and the works £955,000. There has also been £70,570 expended on workmen's dwellings, for which the London County Council hopes to get some recoupment. The total approximate cost of the tunnel is therefore £1,383,490.

MR. DOUGLAS COCKERELL informs us that he is forming classes for the teaching of book-binding at 6, Denmark Street, Charing Cross Road. Each class will consist of not more than six pupils, and will meet twice a week for two hours. The tools and appliances, but not the material, will be provided by Mr. Cockerell.

THE Wesleyan Chapel Committee has agreed to sanction the erection of five new chapels and the purchase of a sixth, providing sitting accommodation for nearly 2000 persons, at a cost of over £11,000. The new chapels are to be built at Fleet, Portland, Fortune's Well, Sheffield, Westbourne, Bournemouth, and Ballaugh New (Isle of Man).

NEW TOWN HALL AND
LAW COURTS, CARDIFF.

CARDIFF TOWN HALL AND LAW COURTS COMPETITION. DETAIL OF PORTION OF FRONT. BY MESSRS. LANCHESTER, STEWART, AND RICKARDS.

HALF TIMBER WORK.

BY W. A. MELLON.

(Continued from page 405.)

DEALING first with The Oaks at West Bromwich, the timbers here present quite as much surface as the plaster; and their strong vertical lines, broken only by the door and window openings, give a very decided character to the design—a character which recalls very strongly, however, a point to which reference has already been made, namely, the use of carved braces. The eye, in reviewing this elevation, finds actual relief from the monotony of vertical lines in resting upon the porch with its simple, open curves. The picturesquely ornamented tower breaking boldly through the roof also gives a unique interest to the design, and helps materially to take away any feeling of flatness. The peculiar arrangement of struts in this latter is reminiscent of Japanese work.

Trewern Hall is a design of a totally different stamp, and, while it may not rank in importance as a building with the previous example, it is certainly not second to it in point of interest. Of the four gables in this front no two are alike, and, judging from its general appearance, it would appear that when the house was begun nothing was matured excepting, perhaps, the plan. The design of each part seems to have been influenced by the material at the workmen's service at the time. Every stick in the building is purpose-like, and the distribution of timber and plaster is very effective indeed. While the picturesque effect of the whole may have been quite accidental, it is an accident of which the modern intelligent workman would never on any account be guilty. The artistic value of a happy use of quartering as here exemplified is also worthy of notice.

The general view of Moreton Hall is of mixed merits. While it possesses the ground-work of a very telling composition, and is, indeed, even as it stands, a very striking group, yet the disposition of timber and plaster is not so good. There are two features in particular which may be pointed out as showing how a good idea may be pushed to extremes and overdone. The first is the use of raking struts in a gable. These standing alone divorce the upper part of the gable from the lower, and utterly destroy any feeling of natural growth, ill compensated for in any constructive appearance gained. The disagreeable effect may be lessened by the judicious introduction of one or two horizontal or vertical members. But if the first feature is disagreeable, the second is exasperating. This is the constant repetition of braces round the junction of the vertical and horizontal timbers. It has a bull's-eye effect—the reverse of restful or soothing, and, it may be fancied, particularly aggravating to bovine instincts. That these two features, if carried out in moderation, may be rendered very pleasing is

FRENCH BARGEBOARDS. BEAUVAIS (TRUSSED).

fully borne out by the gable in the courtyard, wherein they are both introduced.

The illustration of a small portion of Gainsboro' Old Hall shows a very delightful piece of timber framing, the happy effect of well contrasted straight and curved lines being fully brought out. The exterior projecting staircase shown here was a common feature in the tenements of ancient London, where it stood out on the pavement, and, running up the full height of the building, formed a very bold and striking feature in the vista. This building, as well as The Oaks, West Bromwich, is partly of brick, and, in passing, attention might be called to the many very harmonious combinations of brick and timber work exhibited by numerous examples of later date. Bricks as a building material were making general headway during the seventeenth century, compensating for the ever-decreasing supply of timber, and the happy blending of the two materials is particularly worthy of attention.

There is one feature in which the workers in this style have, perhaps, failed to maintain their high standard, namely, their oriels. These do not in many cases seem to fit in and combine well with their surroundings. There are many better examples in Elizabethan work, and best of all are those set in plain plastered gables, and of which the Butter Market, Dartmouth, presents a very good example. The richness of the carving is here rendered all the more striking by the reticence observed

in the broad plain surface as background, and the extremely simple projecting bargeboard.

The timber Architecture of France and Germany differs from that of England only in the characteristic details naturally following upon a distinctly separate growth. Timber was much used in France during the fourteenth century, and there are found many beautiful examples, although few country houses were erected owing to the troubled state of the country. The chief difference from English work results from the length and straightness of the timber available. The examples illustrated present normal street fronts, the St. Andrew's Cross in the quarterings of the houses at Lisieux being a constantly recurring feature. An important feature not found in English work is the trussed bargeboard framed up of different timbers of moderate scantling. This was very common in France, and sometimes one bay of the actual roof timbers was exposed on the exterior. The use of dormers was also developed to a wonderful extent. While in a small building they may destroy all feeling of breadth and repose, they have a picturesque beauty of their own; and the low broad windows nestling under the eaves that they supplanted, while perhaps equally interesting, must have been sadly inefficient for lighting purposes. Whereas in England the timbers were always painted for their preservation, in France, at any early date, they were in many cases protected by means of small slates, and probably this was the origin of the slated dormers and slated gables which are so common—a very quaint and effective treatment. There also existed on some parts of the Continent an ancient custom of painting the houses in gay colours. This custom, while very suitable for warmer climes, where sunny skies and a bright atmosphere tone down the gaudiest colours, could not meet with any great measure of success in such a dull climate as the English, which, instead of being enlivened thereby, would only have its dullness rendered more emphatic. There is usually a want of softness about the simpler specimens of foreign work, resulting from the absence of the curved lines of oak-built houses, the use of straight wood only carrying with it a certain stiffness and formality. There is another class of street Architecture on the Continent which in point of richness vies with the English Elizabethan. The main timbers are elaborately carved, and the interstices filled in with carved wood panels, sometimes with niches for plaster figures, the whole elevation presenting no plain wall surface whatever. This style of finishing may possibly harmonise and contrast

ABBEVILLE

(TRANSITIONAL)

FRENCH BARGEBOARDS.

BUTTER MARKET, DARTMOUTH. FROM A WASH DRAWING BY W. A. MELLON.

well with the surroundings, but, taken by itself, the amount of rich detail defeats its own object, and the building becomes more curious than pleasing. This style of work is common at Hildesheim and Nuremberg. The latter place has for many centuries been famous for its sculptors in wood. These are said to have been introduced into England, in which, at one period, wood carving flourished to such an extent that even the village stocks and ducking stool were so decorated. Home talent, however, was not wanting, and the Adams in the modelling of their work requisitioned the services of carvers from Edinburgh, which is said to have produced some very good men.

The timber Architecture of Switzerland differs radically from that which has just been dealt with—the French or English influence failing to reach there—and adapts itself to the conditions peculiar to the country. Pine being the material used, the lines of the buildings are long and unbroken, and the exterior covering being entirely of wood, very broad surfaces are obtained. The eaves are projected to an extraordinary extent to ward off the snow, and the brackets thrown out to support these form a very striking feature. The doors are placed high in the wall, and are reached by outside stairs. With the exception of the base, which is of stone, the material used is wholly timber.

Having glanced thus briefly over the subject, the question naturally arises "Of what practical use to anyone can be the study of an obsolete mode of building;" for though still a serviceable mode of construction, which may be used with much advantage in out-of-the-way country districts, it is only in rare instances, and in such towns as Chester that really genuine timber houses of any magnitude, and constructed on traditional lines, can be erected. Architectural history, however, presents many parallels, and at the present day a style practically discarded for generations has again come to be copied simply for the sake of its intrinsic beauty, and applied as a veneer to buildings to which it has no genuine or truthful application. The very fact of present day half-timber work being a sham, may, with some, preclude its use altogether. There is no reason why a wall should not receive on the outside as well as inside a coating of some better material, so long as such does not belie its true construction; but when to a stone or brick wall is imparted a false appearance of timber construction, the analogy of Nature is altogether departed from. At the present day, however,

the teachings of Nature are at a discount, and if sham timber work is an evil, it often hides a greater—bad brickwork. The spirit of the age condones such trifles, and it may be argued in its favour that the system is justified in its picturesque results and cheapness. In England, however, a wider and more legitimate field is offered in the use of brickwork, stone dressings, and rough cast, and in Scotland, possessing as it does a beautiful and characteristic domestic style of its own, and one capable of great development, the use of half timber so called savours almost of affectation, and cannot fail in course of time to be discarded as a craze. An indiscriminating client, however, wants his Architecture like his bicycle—up to date—and if his fancy lights on half timber, one cannot do better than observe the points that make or mar a design, and to a few of which, in addition to those that may already have been mentioned, reference may now be made.

(1.) The Barge board.—This may be moulded or carved. If simply moulded with a dentil or other enrichment as taste dictates, the success and character of the board will greatly depend upon the manner in which the ends are finished. If carved, it is better not to cut the edges, but to keep them continuous, and treat the ornament as enclosed, preferably geometric, or towards the same end cusps may be cut on the edges, and a continuous fillet planted thereon the whole length of the board. The board thus retains its fundamental meaning, and the treatment is more appropriate to its position. It may be said that instead of protecting the walls, the carved barge board itself requires protection, but this objection is perhaps more fancied than real. The barge should not continue down and cover the eaves, because if these are of any great projection it would thus gain a heavy appearance. There exists at the present day a prejudice against carved barge boards, for which, perhaps, bad modern work is to some extent accountable, but if well designed and executed they form a very charming feature.

(2.) The Finish of Post and Plaster.—It is customary nowadays to project the timber, or facing as it really is, $\frac{1}{2}$ in. or so beyond the face of the plaster. This may afford a better key for the latter than if they were finished flush, but the latter mode offers a much better appearance. It is almost universally so treated in old work, and in any exceptions there are the edges of the timbers are moulded.

(3.) Waterproofing.—Where walls are harled the interior brickwork does not receive the usual keying with cement, and as the

harling is not impervious to moisture, there is but little protection against damp. The bricks should, therefore, on the most exposed sides at least, be laid in cement. This treatment renders unnecessary an air space in the walls, the bricks being in addition a bad conductor of heat.

(4.) The Use of Curved Braces and Finishing of Timber.—This is a very important point, more so, perhaps, than any other requiring to be dealt with. The charm of old English work consists largely in the naturally twisted outlines and roughness of the oak. Nowadays, perhaps, the best thing that can be done is to fashion the curves artificially, depending for good effect upon the sweetness of the lines; and, while one cannot hope thus to gain the picturesque ruggedness of the old work, yet a certain trimness is imparted to the building which is not to be despised. But the modern architect carries this trim feeling a little too far when he planes the surface of the timber as smooth as possible, forgetting that he is dealing with carpentry work, and intensifying the feeling of tameness. Too often, likewise, a coat of body colour is applied in more or less bad taste, the total result being a mere caricature of old work. These faults suggest themselves the remedy. The timber should be placed in position fresh from the saw, or, still better, off the adze, and, if they are stained and oiled to preserve them, and yet show off the natural grain of the wood, a feeling of life is imparted which is of immense value to the design. In this connection mention might also be made of the wood fastening pins at the junction of the timbers. In old examples the heads of these are always left projecting half-an-inch, and, simple as such a matter may seem, they have quite a wonderful effect in the interest they give to the wall surface.

(5.) The Use of Modelled Plaster.—This is capable of great development, and, as a treatment of the triangular part of the gable, it is very appropriate. If treated in two tints, the effect is very good, and the variety of design is, of course, only limited by the skill of the designer.

In half timber, as in all else, the most difficult thing is self restraint. The old houses exhibit many quaint features, but such quaintnesses are in the main the outcome of necessity, for in a new style men plan primarily for convenience and utility, and these characteristic little bits crop up quite naturally and accidentally; although, of course, it is not to be supposed for a moment that the architects overlooked or set aside any opportunity, when such offered, of making any feature more interesting. The modern architect, however, too often mistakes these quaint bits for the design itself, and makes his plan to suit the introduction of as many of them as possible, the inevitable consequence being a feeling of straining after effect.

In closing, reference might be made to the cheap sneers that have from some quarters been launched at the bulging walls and billowy floors of old timber houses. Where such is the case, the faults usually result from the main timbers having been carried down into the soil instead of being carried on a stone base, and, as the inevitable decay from damp set in, unequal settlement took place, resulting in the well-known picturesque exterior, and, needless to remark, equally inconvenient interior. With all its vagaries, however, one can afford to look with sympathetic eyes upon work which has stood the test of centuries, nor should such examples as Moreton Hall and Bramhall Hall, whose solidity and strength have preserved them nearly perfect to the present day, be overlooked. These were the productions of them who built for posterity. Their living representative, the modern architect, in collaboration with the modern carpenter, does not build for posterity, for which posterity will, no doubt, be duly thankful.

The study of old domestic work is extremely interesting, not only for its own sake from a technical point of view, but also from the amount of casual information one comes by in pursuing it. Many sketches of old queer characters are bound up insolubly with the quaint houses and streets of the picturesque old towns.

OLD HALL, GAINSBORO. DRAWN BY W. A. MELLON.

ART IN CHURCHES.

BY SIR WILLIAM RICHMOND, R.A.

IN the course of an address on decorative Art in church ornamentation, delivered at the annual meeting of the Clergy and Artists' Association, Sir William Richmond said the new movement was most interesting, and might become very useful. It was, of course, impossible to avoid a certain commercial element in an institution of the kind, but the tendency of all things in England was to drop down into pure commercialism with a rapidity that was perfectly appalling, and that should be guarded against. Many people supposed that in ecclesiastical Art Englishmen were always inferior to Continental artists; but one had only to glance at the specimens of work in the books of miniature painting—the Bodleian Library, at Oxford—or at the sculpture in the cathedrals at Ely, Exeter, Lincoln, or Wells, to see there

subject. Then, again, bad drawing was not necessarily devotional. Why was it necessary to make a man or a woman, because they were supposed to be exceptionally good, to look exceptionally silly or weak? There was a large class of people who supposed that a pious picture, or a pious window or reredos must have a certain mawkish sentimentality about it. He sincerely desired that the Association should do what it could to secure that Art in churches would be in the best sense manly, and also modern. They should choose subjects from the history of their own time. There was no period when we knew more of the heroism of Englishmen than at present. There was an instance the other day at Margate of magnificent self-sacrifice which required on the part of the men manning the lifeboat as high courage as that which induced the ancient Christians to go into the arena. Why should not a subject like that be chosen for a picture on the walls of a cathedral or church? He did not say that that particular incident should be chosen, but there were no

"ANTIQUITIES."

A DECISION IN ROME.

AN important decision, regarding the export duties laid on such articles of commerce as fall under the very vague and elastic heading of "antiquities," has just been rendered by the Court of Appeals in Rome. As is known to all who have attempted to purchase such articles at Rome, the export duty of 20 per cent. levied on them by a law which is an inheritance from the Papal Government, is not only a grave charge, but one which is sometimes embarrassing to determine, the value of such things being purely fantastic. The law, known as the Pacea edict, applies only to the late Papal territory, each one of the ancient realms of Italy having still its ancient regulation, the duty from Tuscany being 1 per cent., and that from the former Austrian possessions nil. The Roman Court has decided that it only applies to such objects as are recognised as "precious"—i.e., as of exceptional artistic

TREWEEN HALL, MONTGOMERYSHIRE. DRAWN BY W. A. MELLON.

Art of a standard that is still unequalled. The churches of England were originally painted and ornamented with frescoes even more than the Italian churches. The Reformation, however, not only stopped all progress in this direction, but it destroyed what had already been collected during centuries of labour. The Oxford Movement taught people that religion had something to say to Art, and Art something to say to religion, and it led to the Gothic revival which was led by Pugin and Barry. The School of Design at South Kensington had also given the movement some encouragement, though not sufficient as regards the carrying out of the designs. Unfortunately, a number of commercial people took advantage of the movement, and, forming themselves into firms, gave it a commercial aspect. It was extraordinary the abuses that crept in when people only had the idea of making as much money as they could. In his opinion, Art in the churches ought to be an expression of our national life, including not only the actual incidents, but also the tendency of the thought of our own time. The artist ought, therefore, to be allowed considerable breadth in the selection of his

lack of analogous occurrences continually happening, and, by taking them, our religious Art could be made a national Art, and the heroism of the race could be made more catching, if he might use that word. The Association must ensure the application of better workmanship than the commercial firms were able to supply—there must be guiding it a strong, sensible, manly feeling, not a morbid and ecstatic religious feeling.

A GRANITE drinking fountain, in commemoration of the Queen's Jubilee, situate at the north-east end of Shaftesbury Avenue, at its junction with New Oxford Street, has just been unveiled.

THREE men were killed and three others injured by the fall of a scaffold at Ayr Town Hall. The hall was destroyed by fire on the first of July, and a number of labourers were recently engaged in taking down the walls. Nine men were on a scaffold at the east end of the building when it suddenly gave way. The erection of the scaffold was, it is stated, a sub-contract.

or historical value. The limitation is as vague as the old definition, and perhaps the best results of the decision will be to compel the Government to pass a general and rational law, under which the possessor of an object having value from its antiquity shall be free to carry it out of Italy. Professor Villari, when Minister of Public Instruction, proposed a sensible and comprehensive law, which, while imposing a small duty and the necessity of a permission to export, for the purpose of controlling the exportation of the heirlooms of the nation, made it indispensable for the Government either to purchase or permit the exportation. This law, like most of those which the public good has called for, has ever since lain covered by the petty legislation for electoral purposes, which impedes all useful reforms other than those demanded by the constituents of the ministerial deputies. If an object is precious and indispensable to the honour or history of Italy, it is reasonable that its exportation should be prevented, but only by purchase, for it is an outrage that a man may not dispose, according to his interests or necessities, of articles which are his unquestionable property.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 22nd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A MEETING has been held at Wakefield to receive the report of the committee appointed in October to promote a memorial to the late Bishop of Wakefield. A report from the late Mr. Pearson, R.A., in which he recommended that Wakefield Cathedral should be enlarged at an estimated cost of £20,700, was adopted, and it was also decided that a memorial window should be provided by children. The sum of £1200 was promised in the room, £400 having been previously subscribed.

At the Houses of Parliament, the arrangements for the coming session are practically already complete. This recess has been free from the carrying out of any of those internal structural alterations which so frequently delay the final preparations until the close approach of the date fixed for reassembling. The only change of the slightest importance which has called forth the efforts of the Office of Works has been the opening of a new doorway, to facilitate the passage of members and their visitors to and from the now fashionable terrace.

THE Dean and Chapter of Canterbury have approved the revised design prepared by Mr. Jackson, R.A., for the tomb of the late Archbishop Benson. It will be Early English in character, and has a general resemblance to the tomb of Archbishop Peckham in the Martyrs' Chapel. The construction of the memorial will be at once proceeded with, and when completed it will be erected over the resting place of the late Primate in the north-west angle of the cathedral nave.

VENICE has been the scene of a most interesting ceremony. An act of vandalism perpetrated some centuries ago has been expiated. The great Lion of St. Mark has been restored to the Doges' ancient palace. Andrea Gritti, who was Doge in 1523, not content with winning back for Venice all the possessions which were hers prior to the League of Cambrai, also erected the celebrated Lion. It was twenty-three metres in height. The Doge was represented as kneeling in prayer at its side, whilst one of the Lion's paws rested on an open Bible. It remained in the middle gallery of the Doges' Palace until hurled away as one of the victims of Venetian democratic vandalism. Two years ago the work of restoring the Lion was confided by the Italian Ministry of Fine Arts to the well-known sculptor, Signor Urbano Botasso. The product of his genius, which is almost a fac-simile of the original figures of the Doge and the Lion, is now finished.

THE Marquis of Exeter writes:—"As a member of the committee for the restoration of Peterborough Cathedral, I venture to draw the attention of the public to the work which has now been carried out, and paid for, upon the northern point of the west front. No one who has watched the progress of the work can fail to appreciate the care which has been shown. The committee have now to deal with

the remainder. The south-west and central gables of the west front, and the north transept, and the eastern chapel, are an immediate cause of anxiety. To cover these repairs, £7500 is required, and I appeal to those who are interested in the preservation of these sacred and historic monuments to help the committee in their task. The skill shown by the late Mr. Pearson and his assistants in taking down and restoring the old stonework is a security to any who are alarmed lest the old feature should be sacrificed, and is a guarantee that money sent to the Dean of Peterborough to forward the committee in their work will be spent upon that which Mr. Pearson reported to be absolutely indispensable." The authorities at Peterborough should be closely watched.

It is announced that Her Majesty's Judges have expressed their intention of approving the plans submitted by the Corporation of London for the erection of a new Central Criminal Court, and that the work of demolition will proceed at no distant date to make way for the new building. The delay has been caused by an endeavour to retain the corner-piece, facing Giltspur Street, as a stronghold for the City of London in the event of any future rioting. It has now been decided, it was stated, to agree to the removal of the portion of the prison referred to.

AFTER many months of hesitation, the Council of the Royal Academy has at length taken a definite step in connection with the proposed alteration of the laws governing the summer exhibitions at Burlington House. A committee of six Academicians has been appointed to report generally upon the whole question, and particularly upon the advisability of reducing the number of pictures submitted by outsiders. Whatever be the report of the committee, it is not, however, probable that the arrangements for the exhibition of 1898 will undergo any alteration. Besides the amending of its rules, the Academy will shortly have other important business on its hands in the shape of elections. There are just now no fewer than four vacancies among the Academicians, caused by the deaths of Sir John Gilbert, Mr. Burgess, and Mr. Pearson, and by the recent retirement of Mr. Horsley. The election of successors to the four Academicians will, of course, make as many vacancies among the Associates. There is already one Associateship unfilled—that caused by the promotion of Mr. Sargent last January, so that five outsiders may look forward to being received into the Academic fold during the early spring.

A DESIGN for Vauxhall new bridge has been unanimously approved by the Bridges Committee of the London County Council. It promises to be a striking addition to our Thames bridges, and if carried out as proposed will be constructed of concrete cased in granite. The temporary structure is likely to be completed in January.

A NEW departure in the construction of prisons has been made at the Erie County Penitentiary, United States. As prisons are now built, their security depends on the outer walls and gratings over the windows. The heating and ventilating is generally defective, the lower cells being too cold and the upper too warm. They are also badly lighted. The new prison is built with a central corridor, from which the cells open, and these are of steel grating, tool-proof. The cells are heated by steam pipes, each story separately, and skylights in the corridor illuminate them. From a watch tower in the middle of the corridor the guards can see every door of the cells. There is also a guard's walk at the rear of the cells, which are ventilated by openings in the steel doors of the cells, which do not permit a prisoner to see out, thus completely isolating him. Exercise is taken in the central corridor.

AN "open space" that has a European reputation has long been threatened, and has now at last been rescued from the speculative builder. In no capital has he been more active lately, or more ferocious, than in Rome.

He found the old city marble, and he is rapidly leaving it plaster. Everyone who knows Rome will remember the beautiful grounds of the Villa Borghese, just outside the city walls, high upon the Pincian Hill. From thence you look down on the city stretching southward below you, and can see the sun setting behind St. Peter's. In the healthiest quarter of Rome, this site was the very opportunity of the speculative builder, if chance were to cast it into the market. And of this there has latterly been an alarming probability. The Borghese family were no longer the inheritors of their old opulence. Year by year the quaintly laid out grounds were falling into neglect, and the artificial ruins were crumbling in veritable decay. Once the Casino held a collection of antique sculpture so rare that Napoleon carried them off to Paris, and the indemnity promised to the Prince Borghese of that day—fifteen millions of francs—was never paid. But the pedestals were not left unoccupied, and to this day the Casino is one of the sights of Rome. The grounds themselves are, in a way, its Hyde Park. It is here that, in the season, in the winter months, and in the early spring, the fashion of the modern city is seen, and scarcely a day passes but the scarlet liveries show that the King or Queen is driving in the grounds. This "open space" was too intimately associated with many sides of the life of modern Rome to allow of its being sacrificed to the builder. The municipality has bought it from the family, to whom will be paid for the concession an annuity of £6000 a year.

THE Lord Mayor and Sheriffs, who wore their robes of office, and were attended by the sword-bearer and mace-bearer, attended an interesting commemorative service at the Church of St. James, Garlickhythe, at the foot of Garlick Hill, City, on the 10th inst., the anniversary of the reopening of the sacred edifice on December 10th, 1682, after the rebuilding by Sir Christopher Wren in consequence of the Great Fire of London. The Bishop of London remarked that the interest taken in the City churches where-with London was decked by one of the most brilliant geniuses England ever produced was gratifying to those who worshipped in that building, and to those who were its custodians. The whole of the tower and west front of the church have been carefully restored, and the quaint clock, with its figure of St. James, repaired and redecorated.

THE Fire Brigade Committee of the London County Council report an instance in which the operations of the Works Department have resulted in a large saving. The Council, on October 20th, 1896, and April 6th, 1897, authorized the execution by the department of some repairs, painting, and drainage work required at the Rotherhithe Fire Station, the architect's estimates being respectively £490 and £148, making a total of £638. The revised estimate of the work amounted to £658, but the actual cost has been £489, a saving of about 25 per cent. on the revised estimate. The manager of the department gives the following explanation of the saving:—"I attribute the greater part of this saving to the improvement in the organization of the Works Department and the closer attention now given to detail in carrying out the work. Greater care is observed in collecting materials together before commencing the work, and advantage is taken of any circumstances by which a saving may be affected. In the present case the materials were collected in the yard and barged to the job instead of carting in small lots. We were able to save also by reason of having other work proceeding at the same time in the neighbourhood, and, further, were not interrupted by arrangements necessary for the convenience of the fire brigade, as is generally the case. There were other circumstances which helped to increase the saving, and which we cannot expect always to find in other works."

THE great canal, the total length of which will be nearly 1000 miles, and which is to connect the Baltic with the Black Sea, is to be

commenced next spring, the surveys for it being in an advanced state. The new waterway is to be 217ft. wide at the ordinary water level, and 117ft. at the bottom. Its depth being 28½ft., the largest war vessels will be able to pass through it. The canal commences at Riga, and it will follow the course of the river Dūna, as far as Dūnaburg. Here the great excavations will begin which will connect the canal with Lepel on the Berasina. That river will be utilised as far as its junction with the Dnieper, when the latter will be followed to its mouth, near Cherson. Of the whole length of the canal, 875 miles will be canalised rivers, leaving only 125 miles for the excavator. The canal will have eighteen ports—at Riga, Jakobstadt, Dūnaburg, Lepel, Borissov, Robruisk, Kieff, Pergaslav, Kuneff, Cherkassy, Kremenshug, Verchnedneprovsk, Yekaterinoslav, Alexandrovsk, Nikopol, Berislavi, Aleshki, and Cherson. The enlargement of the two terminal ports of Riga and Cherson, on the Baltic and Black Sea respectively, is at the present time being actively proceeded with. The canal is to be substantially constructed so as to allow vessels to proceed at a uniform speed of six knots. At that speed it will take 144 hours to make the whole journey. The canal is to be lighted by electricity, to avoid stoppages at night. Its total cost is estimated at £20,000,000, and the work of construction will probably take four years.

"In a recent issue of the Times," writes Mr. Mark H. Judge, "Sir Arthur Arnold stated that the London County Council 'had no more to do with the house drainage of Kensington than with that of Birmingham.' I ventured to correct this statement by quoting from the Public Health (London) Act, 1891, to prove that it is the duty of the County Council to make bye-laws with regard to w.c.s and the proper accessories thereof; and, further, that the Council is invested with powers to enforce compliance with such bye-laws. Sir Arthur does not venture to question the correctness of my letter, but says 'it may cause misunderstanding,' and tells of his connection with the Drainage Committee in the following words:—'I have been a member of the Drainage Committee of the County Council since the day of its formation in 1889, and no one can know better that we have nothing to do with house drainage.' If Sir Arthur had said that w.c.s have no connection with drains he would have been correct in some cases, but these cases would hardly have been approved by the Drainage Committee of the County Council. A statement by so old a member of the Drainage Committee as Sir Arthur Arnold might, perhaps, be accepted without question with regard to what the committee 'had done,' but the Public Health Act must be a better authority with regard to what the County Council 'have to do.' I have had to do with the drainage of houses in London for a longer period than the Drainage Committee of the County Council has been in existence, and I am bound to say that my recent experience would seem to show that Sir Arthur Arnold is not singular among County Councillors with regard to the view he holds as to the Council having anything to do with house drainage."

"The County Council," continues Mr. Judge, "has made bye-laws with respect to w.c.s and the proper accessories thereof, and one of them is as follows:—'Every person who shall construct a water-closet in connection with a building shall furnish such water-closet with a cistern of adequate capacity for the purpose of flushing, which shall be separate and distinct from any cistern used for drinking purposes, and shall be so constructed, fitted, and placed as to admit of the supply of water for use in such water-closet, so that there shall not be any direct connection between any service-pipe upon the premises and any part of the apparatus of such water-closet other than such flushing cistern.' However divergent our views may be with regard to machinery for enforcing such a bye-law, after the epidemic at Maidstone I suppose no one will venture to approve of a drinking water supply being in direct connexion with water-closets. On October 11th I inspected a new building near

to Oxford Street, on which I had to report that the cistern for the supply of drinking water was in direct connexion with three w.c.s. My client had an agreement for a lease at a rent of £350 per annum, and it has taken nearly two months to induce the owners to agree to disconnect the w.c.s from the drinking water service. My former letter ought to have convinced Sir Arthur Arnold that the County Council has duties in connection with house drainage, and I trust that the above statement of fact will prove to him that in the interest of the public health, these powers ought to be exercised in so important a matter as the connection of drinking water with w.c.s."

An important point under the London Building Act, in connection with the inspection of stands to view the Jubilee procession, was decided by Mr. Fenwick at Southwark Police Court. Messrs. Patrick and Son, builders, of Westminster Bridge Road, were summoned by Mr. Bernard Dicksee, district surveyor, for the non-payment of £23 12s. 6d., his fees for inspecting a number of stands erected by the defendants within the premises of Messrs. Day and Martin, Borough Road. At previous hearings evidence was given that the stands in question were inspected on the complainant's behalf by a young man named Brown, who was not a qualified surveyor, and it was contended that Mr. Dicksee ought to have personally inspected them.—The magistrate, in giving judgment, said the work of surveying and inspecting was obviously work of a personal character, involving the exercise of professional skill, judgment, and experience; and, in his opinion, such work could only be performed by the district surveyor himself, an assistant surveyor, or by his deputy, duly appointed under Section 142. To hold the contrary would have the result that in no case need the surveyor personally visit the premises, but could sit in his office and sanction or disapprove upon reports brought to him by his clerk or series of clerks, which, he was confident, was not the intention of the statute. Therefore he nonsuited the complainant, but would grant a case, if desired. The whole matter arose out of the fact that the district allotted to the complainant was too large for him, and that more assistants were required.—Mr. Washington said the district surveyors were agitating for an amendment of the Act.

MR. PATON, in his fifth address at the Glasgow Corporation Galleries, on Italian Art, took for his subject "Michael Angelo." He began by referring to the characteristics which distinguished the truly great artist, the true test of whom was that his works deal not with things fleeting, ephemeral, local, and trivial; but with what affects men in all climes, in all times, and under all conditions. Frith's crinolined woman was like a fashion plate of 1870; Raphael's Madonna was the eternal feminine. The two great sculptors of the world were Phidias, the Pagan, and Michael Angelo, the Christian. The works of Phidias were serenely beautiful, bright, passionless, calm, fit types of the gods of a people where deity and humanity touched each other at so many points. The gods of the Greeks were the incarnations of specific powers, virtues, and attributes, and could be fittingly treated in the calm, dignified, and passionless fashion which belongs to sculpture. Michael Angelo had another task as the typical Christian sculptor. He had to express through his obdurate material, and with the limitations of sculpture, something of the spirit of modern man, to deal with things pertaining to the unseen and the eternal. Hence his figures are full of action, emotion, of the suppressed excitement and volcanic thoughts which possessed the man. Michael Angelo was a great solitary Titanic soul full of concentrated thought and impassioned imagination, pure in life, steadfast in faith, loathing and lamenting the conditions of life and society around him—the prophet or seer of the Renaissance.

ARMADALE CASTLE is one of the most imposing baronial piles on the West Coast. It

is the home of the long-famous Lord of the Isles. Perched on a bold headland overlooking the sea a few miles from the Point of Sleat, it seems to bid defiance to the Scottish mainland, while at the same time it guards the approaches to Skye. The interior is fitted up and furnished in lordly style, and in the hall is a beautiful stained glass window, representing Somerled, first Lord of the Isles, clad in armour and with battle-axe. Armadale may be called an architectural evolution—the growth and product of ages. Practically a modern structure, it is yet old. In the past it was only a casual and minor residence of the Lords of Sleat, but has been added to and embellished from time to time, chiefly within the past century or so, until it has reached its present stately proportions. Perhaps the most conspicuous among its constructive chiefs was Sir Alexander Wentworth, the second Baron, who spent some £35,000 in improving the property.

THE London County Council has just had two actions in the Queen's Bench Division by which it sought to compel the Rowton Houses, Limited, of which Lord Rowton is chairman, and Mr. Davis, the owner of some shops fronting Brick Lane, to set back the new buildings which they have just erected in the place of older buildings that had existed prior to the Building Act of 1894. The County Council contended that under this Act its consent must be obtained by owners erecting dwellings for the working classes, as to the distance of the frontages from the centre of the roadway and as to the height. Mr. Davis's shops and the Rowton House at Newington Butts were being completed without this consent. Rowton Houses, Limited, demolished thirteen old buildings, and have erected on the same site a building capable of accommodating 800 persons. The Court held that the provision of the statute relied on applied to flats in artisans' dwellings, model dwellings, and tenement houses, and not to buildings like those described in the present cases, and the actions were dismissed with costs.

An interesting exhibition is now open at the Camera Club, Charing Cross Road. The photographs are illustrative of the archaeology of the British Isles, and many members of the National Photographic Record Association have contributed. The president and founder of the Association, Sir Benjamin Stone, has sent a number of beautiful platinotypes of Westminster Abbey, in which the smallest architectural details are brought out with wonderful clearness. A record of the objects, many of archaeological interest, scattered through Ireland, including cromlechs and round towers, has been furnished by Mr. R. Welsh in an interesting series. Devonshire photographs, principally of curious stones and crosses on Dartmoor, have been contributed by Mr. F. Burnand, F.S.A., and Mr. Law Bros sends a collection, principally devoted to prehistoric remains. Many photographs are included in the exhibition of the beautiful Elizabethan houses which are still to be found in England, while close by is a collection showing the pillories, stocks, whipping-posts, and ducking-stools still preserved in many country towns. An interesting exhibit comes from Mr. St. John Hope, F.S.A., in the shape of a paper scale mounted on wood, and marked on one half with English feet, and on the other according to the metrical system. It can be easily folded and carried with the tripod. Photographs of different cathedrals and other places of interest have been lent by Mr. T. Bulbeck and Messrs. S. B. Bolas and Company, and amongst other exhibitors are Messrs. W. A. Greene, G. Scamell, Kenrick Murray, Professor Bothamley, F.C.S., Major H. Trevelyan, Mr. Y. F. H. Woodward, and Mr. E. Marriage.

An interesting work of a rather technical character is promised in Mr. William Bemrose's "Bow, Derby, and Chelsea Porcelain." This book, which will be found to be based upon documents hitherto inaccessible to any

writer on ceramics, will shed new light on a good many obscure points in connection with the porcelain works in question. For instance, the exact site of the Chelsea works is ascertained, and personal particulars of Sprimont will be given. And the Derby products are found to be earlier and of more importance than has hitherto been supposed.

THE Millais exhibition at the Royal Academy promises to be one of the most attractive shows that have ever been held there, including as it will almost every one of his popular works. The National Gallery will break through a stringent rule and lend the magnificent "Yeoman of the Guard," and loans will be forthcoming from all the municipal and other public galleries, save, perhaps, that of Holloway College.

LONDON Nonconformists, or, rather, a section of them, are evidently going, if possible, to revive the leasehold enfranchisement agitation. They justify their intention by a personal grievance. Of recent years they have been obliged to relinquish many churches in the Metropolitan district because of the fact that they had been built on leasehold sites. A large number of edifices are still in existence which have been erected under similar conditions. The Presbyterians—by no means one of the strongest of the Nonconformist bodies in the Metropolis—have no less than twenty-two of these buildings, and they are taking the initiative in the movement.

THOUGH we still have a fair number of ecclesiastical buildings in England which can boast of Saxon parts, a church of wholly Saxon origin is decidedly rare. This, however, is practically the case with the village church of Braemore, in Hampshire—on the borders of Hampshire and Wiltshire, and about nine miles from Salisbury—only the chancel of which, it is said, is of a comparatively modern date. The building, which stands almost in Sir Edward Hulse's park, has recently undergone complete restoration. Many interesting features came to light during the progress of the work, including the most unusual discovery of the remains of an ancient rood in the porch, which probably existed from the earliest times, and which is similar to the one at Headbourne Worthy. The remains were formerly shut out from view by a parvise, and were only disclosed when the floor of this had been removed. The church altogether is full of archaeological interest, and is exceedingly picturesque.

THOUGH the Arts and Crafts Society fears that the public does not care enough to support an annual exhibition, the increase in the number of small shows of decorative or industrial Art seems to point to an increase in the interest taken in the subject. At the Maddox Galleries Venice is represented, chiefly, we should imagine, from the manufacturers' and tradesmen's point of view. More or less well-known names to the tourist—like Salviati, Jesurum, Testolini Brothers, the Venice Art Company, Pagliarin, and Franco—are the exhibitors. They are showing the often very beautiful reproductions of old brocades now being manufactured in Venice, the laces of Burano, the carvings and furniture that are copies of old models, and the glass which at times is really good, at others as flimsy and showy as the loungers in the Piazza and the purchasers of cheap souvenirs would have it. The collection is worth seeing. The modern manufacturer is far more infallible in matters of taste, but when in Venice he has the sense to return to the good designs of the craftsman of the past, he cannot go very far astray.

THE Midland Railway Company has definitely decided not to erect a central station at Sheffield, but to greatly enlarge the present one at a cost of nearly a quarter of a million. The carrying out of the scheme will provide Sheffield with one of the largest and best equipped stations in the provinces. The work will involve the making of a tunnel under The Farm, which is the residence in Sheffield of the Duke of Norfolk.

MODERN ARCHITECTURAL PROBLEMS.*

AS ILLUSTRATED BY SOME EDINBURGH BUILDINGS.

BY PROFESSOR G. BALDWIN BROWN.

(Continued from page 402.)

MANY, perhaps most, architects of our time may not recognise in the Renaissance style of which I have been speaking a style with which they have any more natural sympathy or traditional connection than with any other. This result of the eclecticism of the nineteenth century we may deplore, but it is a fact we must accept it as it stands. To the architects thus minded, the problem of style will present more difficulties than is the case with those who can still feel the tradition of the Renaissance coming down to them through the last four centuries. To rest in mere eclecticism is to the more earnest minds in the Profession intolerable. What are they to substitute for it?

IS IT POSSIBLE?

Is it practicable to evolve a new style altogether that shall be the expression of modern conditions? It will be no doubt impossible, even if it were a thing to be desired, to get away altogether from the old forms and details. Even in Gothic Architecture, though the constructive system was so unclassical, a large stock of forms was taken over from the antique world. Now, in Gothic, the essential features of the style were evolved from the materials and system of construction, and this gives us the hint from which the modern designer might begin his new departure. In the evolution of the classical and mediæval styles the character of the material employed was counted for much. The forms of Greek Architecture are all constructive forms, though the material which originated them is not the same as that in which the style was ultimately carried out. The forms of Gothic are genuine cut-stone forms, worked out in the material used from beginning to end of the style. Brick or timber could never have produced them. In both these cases design has waited on material and construction, and it may almost be laid down as an axiom that material and construction are the essential bases of design in the tectonic arts.

DESIGN AND MATERIAL.

How does this axiom apply to the question here under discussion? In modern days the architect disposes of a new material altogether, iron or steel, and this material, though not universally employed, is used for a large and growing class of buildings in our great centres of population—the street fronts of buildings that have to present below an extensive shop window, with a considerable height of elevation above. The way in which work of this kind is being carried out here and in America cannot be considered satisfactory. Structures of this order are put together of a sort of framework of steel, but the real fabric is disguised externally by a coating of stone or brick. One can see in recently rebuilt street frontages in our large town façades of several stories, apparently in solid stonework, that rest below upon a ground floor composed entirely of plate-glass shop-fronts. The steel pillars that in reality, with the aid of horizontal girders, bear up the superstructure, are ashamed of themselves, and may often be discerned masquerading as door jambs. There is an insincerity about all this that counts to the discredit of the constructive arts of the day. It looks as if we had forgotten the old-established relation between

material and form that was like the cornerstone of the practice of these arts in the ages of the past.

NEW MODES OF ARTISTIC EXPRESSION.

The architect of to-day who would start a new style should begin by the endeavour to find new modes of artistic expression for the new conditions and processes that govern modern building—at any rate, in some important forms of it. This use of metal for building purposes is also common in the construction of roofs, and it is pretty certain to become more and more extensive as time goes on. At present the characteristics of the material are, as a general rule, ignored, and not allowed to find their expression in the resulting artistic form. Our own country, which produces the material in enormous quantities in the forms necessary for constructive use, has done little to make these constructive features into elements of artistic design. The French seem to have taken the problem more nearly to heart. A very good illustration may be found in the new North Bridge at Edinburgh. The great arches are of the material in question, and the spandrels of them exhibit that sort of lattice-work of braces crossing each other at right angles and strengthened by diagonal struts that is the common filling of a framework of iron or steel. There are here the elements of an artistic treatment ready to hand. A lattice can be made elegant in shape without loss of strength, while the points where the braces cross demand bosses, rosettes, or masks, which lend themselves cordially to decorative effect. In the North Bridge all these possibilities are ignored, the forms in question are hidden out of sight, and the spandrels are covered on the outside by an ornamental composition of arches, in which stone forms are deliberately copied in iron, and used to hide away out of sight the real features of the construction. In the course of the discussions which went on a year or two ago about this new North Bridge, it was urged from some quarters that in works of the kind an architect should be joined with the engineer in order to secure an artistic embellishment of the structure. Something of this kind has been done, and the result is what has just been indicated. The bridge is handsome enough, and the enrichment is in the recognised taste of the day, but there is no attempt at all towards a solution of the pressing question of the artistic treatment of these important modern materials. Nor can there be any valid solution except such an one as may come from those working in the materials themselves, and making their characteristic forms the elements of artistic design. The constructor who will do this will have gifted his age with, at any rate, some elements out of which a modern architectural style may be in time evolved.

THE decoration works which are sought for immediately in St. Paul's Cathedral are these: Mosaics in the six saucer domes, three on each side, in the north and south aisles of the choir; cost, £1000 each. Mosaics round the drum of the great dome, above the Whispering Gallery, £10,000. Mosaics in the saucer domes in the nave and transepts, about £1500 each. Mosaics in the panels of the choir aisles. The activity of the decoration committee has hitherto been confined to the choir and apse, where mosaics have been applied, pilasters cased in marble, and the reredos, which gave rise to considerable controversy, erected. Other work is in progress. But when that is completed, and even when the work, for which aid is now sought, is finished, much remains to be done ere the cathedral puts on the vesture which Wren conceived. There are certain architectural dispositions he left behind him in the structure which are said to plainly indicate his intentions with regard to a homogeneous scheme of mosaic ornament.

HOUSE DECORATION.*

By L. A. SHUFFREY.

THE trade "painter" hardly gets its share of attention in many specifications, and the description, "clearcole and distemper ceilings, hang paper at so much per piece, and paint all work usually painted four coats of good oil-colour," will not ensure a good result in the hands of the ordinary contracting builder. For many years the tendency has been towards depending upon manufactured wall and ceiling coverings rather than upon hand-painted decoration, panel, and pilaster treatment and arabesques, until the practical painter who can carry out work of this kind has become a rarity.

A DIFFICULTY IN THE PAINTING TRADE

is that fluctuations of work at the different seasons of the year have a demoralising effect upon the men. When work is slack many are thrown out of employment, and when busy others are taken on who can just handle a brush, but who have served no proper apprenticeship to the trade. It is absolutely necessary to the successful carrying out of a job that a skilful and experienced foreman painter should have charge of it, whose duty it should be to control the execution of the work, mix all materials, see that proper tools and plant are used and taken care of, and that the rubbish is cleared away from time to time and the rooms kept clean. I do not propose to go into the proportions of the mixtures of materials to be used, as I could not give information on this subject from actual experience; it is a part that an architect can hardly be expected to remember, and must leave to the foreman painter. It is, however, a great convenience, and commands respect from the workman, to be able to take palette and knife in hand, and

MIX THE TINT REQUIRED

on the job. In so doing it is very desirable never to use a colour or vehicle without knowing its name and qualities, as the experience gained thereby will be very serviceable. It is difficult to gauge the amount of time this mixing of tints will take, and I can say from experience that it is desirable not to make a following appointment too soon after. In the progress of a new building you have no doubt, when visiting the works, been suddenly confronted with the question from the foreman of the job: "What colour are we to paint the outside woodwork, and the down pipes and gutters?" and in making the design you will very likely have mentally disposed of the questions whether the frames and sashes should be white, the down pipes green, whether the iron gutter running along the extreme projection of the heavy overhanging main cornice should be treated, as a member of it, at great inconvenience on account of its falls, or to quite a different colour on its own account; whether

THE OUTSIDE TIMBER-FRAMING,

if any, shall be coated with Stockholm tar, in strong contrast to the white plaster panels treated with a coating of boiled tallow and lime; and whether the bargeboards or verge mouldings should be light, like the sashes, or dark, like the framing; whether the front door shall be dark, and, if so, shall the solid frame which surrounds it be the same? The raising of these questions should be a hint that the inside colouring will be coming on shortly for determination, and a scheme of colour for the various rooms should be thought out. The principal objects of painting are to preserve the colours and produce a surface which can be kept clean, and give out a beautiful appearance. Painting has two objects in view, either to change the colour of the surfaces of the various articles painted, or to protect them from rust, rain, or wear. When applied it must become hard, and must adhere firmly to the substance painted. It is desirable, if not absolutely essential, that it should retain its colour, as, although many beautiful effects come through change and exposure, they are

generally due to the disintegration of the surface, or decay, which can only go on for a limited time. Many of you may have admired the greenish-blue colour, originally a common green, of an old garden gate; but if you examine it for the purpose of imitation, you will find that the colour eludes you, being made up of different coloured particles which you cannot match. The pleasant pinky red of old cart wheels, which looks so nice in a farm-yard, is a cheap vermilion which has faded. Tints should be made stronger in outside painting than at first desired, to allow for some diminution from exposure, which will most certainly occur, and for the reason that colours are softened by the atmosphere. In this respect colours vary very much, losing less as they increase in warmth. A soldier's coat will appear its reddest on a foggy morning.

EXTERIOR.

After fixing, the earliest opportunity of a fine day should be taken advantage of to paint all the external wood and ironwork, the priming having been done before fixing. The woodwork, if it be a light colour, will require four coats of white lead, mixed with linseed oil and driers; if it be finished a dark colour, boiled oil, which is a better drier, should be used. For external ironwork, paint composed of oxide of iron and linseed oil is the best protection. In cases of engineering works which have been sent abroad, ironwork which has been painted with oxide paint has stood much longer than similar work painted with red lead. A drawback to the use of oxide paint is that the range of colour is limited, being principally red, which, in the case of a red brick house, is the last colour one would desire. Other colours can be obtained by mixing, but the protecting qualities of the paint are reduced thereby. All gutters should be painted inside as well as out. A painted front door to a house, if exposed to a sunny aspect, is a constant source of expense, as the paint soon cracks off and blisters, and has to be burnt off down to the wood each time it is repainted. A practical painter has told me, speaking from actual experience, that if zinc white is used entirely instead of white lead, this blistering will not happen.

IN THE CASE OF TOWN HOUSES,

cemented or stuccoed fronts often have to be treated, and this is generally done with oil paint; it is a heritage left to us by a former generation, and we must make the best of it. The only satisfactory feature about painted cement work is that it keeps out the wet. The money spent on the painting of cement fronts in London would have paid for the use, in many cases, of Portland stone or rubbed brick—the two materials which, in my opinion, are pre-eminently suited to the London atmosphere. If Portland cement is used, in my opinion it should not be painted for about two years. When cement is left from the float with a granular surface it has a pleasant enough appearance, but it gets so grimy in time, painting in oil is resorted to, and this looks very well until successive coats have filled up the grain, which then has an unsatisfactory reflecting surface, cracks appear which have to be stopped, and as Portland cement cannot be painted with safety until it has stood about two years, these cracks have to be stopped with Roman cement. A distemper which would stand the weather seems to be the solution of the problem. This merit is claimed for Duresco, and, I think, justly. I have made enquiries of master painters who have used it, and they are very strongly in favour of it, providing it is used under comfortable conditions, as to time for hardening. The clubs in Waterloo Place are an illustration of the treatment of stucco. The United Service in its natural colour is depressing in the extreme. The Athenæum, with its white painted dressings and grey distempered walls, shows about the best which can be done with it; and the Travellers' is a good illustration of how a good design suffers from being executed in an unworthy material. The conclusion which I come to is that Portland cement facing is not suitable for London. For reasons of economy, outside

painting should be limited in extent as much as possible; woodwork should be painted every three years with good white lead and linseed or boiled oil, special care being taken to see that the surface is dry and free from dust when it is applied.

INTERIOR.

In dealing with the interior of the house, I propose to take the parts of the rooms in the order in which they are usually finished—ceilings, woodwork, walls, and floors. Ceilings give the decorator more trouble than any other part of the room, for various reasons, the principal being the cracking of the plaster. I have no doubt you are all familiar with the maps of rivers which present themselves when you look at the ceiling on a bright morning a year or two after a house has been built, caused partly by the shrinkage of timbers or vibration from persons walking on the floor above, defective sand, lime, or hair, or by the floating and setting coats following too quickly after the rendering, before it has had time to get thoroughly dry. To prevent this, important ceilings should be lathed on crop battens or ceiling joists fixed beneath the floor joists. If ornamented, the most convenient plan is to make them of fibrous plaster; the method being to make models of the various parts, and then from plaster, wax, or gelatine moulds make their casts of plaster-of-Paris, which have embedded in their thickness canvas and sawn laths of pine, in places where required for strength or fixing. These slabs are then fixed to the battens with screws, and the joists made good with plaster and canvas. Existing ceilings can be covered up by fibrous plaster screwed to the lath and plaster, provided, of course, that the latter is sound and has a firm hold of the lath. Brass screws should be used, as iron ones rust and stain the plaster.

CEILINGS

on the underside of floors, composed of iron and concrete, can be plastered right on to the concrete, if the boarding on to which the concrete is thrown is kept down low enough beneath the joists for the concrete to pass under. Cracking sometimes occurs through the iron joists being run into flues, and the expansion and contraction of the metal caused thereby. In fixing ornamental ceilings of fibrous plaster, battens should be used nailed to the concrete, and the slabs screwed to the battens. Coming to the surface, the most usual method of finishing ceilings is in distemper or tempera. In the case of new work, the surface should be clearcoiled, i.e., washed over with a coat of thin size and whiting with a little alum mixed with it, having previously removed any excrescence. The distemper is made by dissolving the best whiting in clean water until it is of the consistency of thick cream, and perfectly smooth to the touch, to which should be added prepared size, previously warmed, the colour being separately rubbed up with some of the distemper; the whole should then be gently mixed together, and strained through a coarse cloth or metal strainer. When allowed to set it should be of the consistency of jelly, in which condition it should be applied to the ceiling. As

DISTEMPER

changes its colour very much in drying, it should be tried on a piece of white paper and allowed to dry. The drying may be assisted by holding it against the face, or back of the hand, but not by holding it to the fire, which would prevent its drying its natural colour. Having procured the right tint, the distemper should be applied quickly to the ceiling with large brushes, preferably by two pairs of hands, and then stippled with large, flat brushes, taking care not to go over the same part twice. There should be no draught in the room whilst this is in progress, but when completed the sooner it is dried the better. If this operation is successfully carried out, a very pleasing effect is obtained. If the first coat does not dry out satisfactorily, the operation may be repeated. Even with experienced hands distempering is not always successful, particularly if done during foggy weather. If dealing with old ceilings the distemper must

* A paper read before the Architectural Association on Friday, December 17th.

be washed off right down to the plaster face, all cracks raked out and stopped with putty (plaster-of-Paris and distemper mixed), and the whole rubbed smooth with pumice-stone and water; stained parts should be painted with oil-colour, and the whole clearcoated and distempered as before described. If

OLD CEILINGS.

are in bad condition, it is desirable that they should be lined with paper, which should have a coat of weak size before being distempered. Distemper is superior to oil-colour in the clearness and delicacy of its tints, and in that it does not discolour in the same way with age. It is also very much cheaper. Its demerits are that it will not bear washing, and, being thick, it soon chokes up delicate mouldings or ornament. It is, therefore, the custom, where there is a considerable amount of elaboration or ornament, to execute the work in oil-colours, either flatted or flat varnished. This in a country house, or where no gas is used, will last a great many years, and bear washing and touching up. If dealing with ornament in relief, it is a good plan to paint the work twice with oil-colour and then distemper it. The distemper coat rather pleasantly softens the ornament, and can be washed off down to the oil-colour, when the work has to be redecorated. Some of the coarsely-modelled ornament of the Jacobean period may owe its charm to the indistinct suggestiveness caused by successive coats of distemper, but it is hardly desirable to aim at an effect of that kind. The style of ornament which we understand as "Adams" is often executed of composition fixed with tacks and glue in small repeats on a plain ceiling previously lined with paper. This is

A VERY REFINED STYLE OF ORNAMENTATION, and is often pleasantly relieved with painted medallions, in which case a parti-coloured treatment is desirable to hold up the medallions and prevent their spotting too much. The electric light being frequently placed near the ceiling, very slight relief is sufficient, the light coming almost horizontally, and throwing long shadows. Covering a ceiling with a pattern paper is a simple and satisfactory way of treating it. The pattern should be centred with the room, and the joints carefully butted. Stamped materials for ceiling coverings are numerous, and by their use an exceedingly elaborate effect can be obtained at a very moderate cost. The best are they which do not imitate plaster work. They are very useful for strengthening and hiding the defects of old ceilings in a bad condition, but have not the individuality which can be procured by even a little plaster ornamentation designed for its special position, and I look upon them as suitable rather for old than for new buildings. The plan of hanging a heavily flocked paper on the flat of a ceiling and painting it is a good one, and the effect is much improved if a flat band forming a frame to it next the cornice can be arranged so that the ornamented portion has a recessed appearance. This flat band was much affected during the Greek revival period, and often had pateræ fixed on it at intervals. In applying to an old ceiling either ribs or any relief ornament which has strongly pronounced straight lines, it is necessary to apply a straight-edge to the surface to ascertain whether it sags or undulates, otherwise you may find that what appeared level before becomes like the waves of the sea.

WOODWORK.

If it is desired that the woodwork of a house should be painted, and not stained and varnished, a process which I am thankful to believe has almost died out, the knots should be covered with patent knotting, to prevent the resin discolouring the succeeding coats of paint; or, if very bad, they should be cut out or covered with silver leaf. Before the work leaves the carpenter's shop it should be primed with red or white lead, mixed with linseed oil and turps, to prevent its being affected by a damp atmosphere. Backs of panelling, or any woodwork which has to be fixed against a wall, should have a thick coat of oil-colour before fixing. Before the next coat is applied the surface should be rubbed down with glass

paper, and the brad holes, open joints, or cracks filled with hard stopping, and the dust removed. The second coat, mainly of linseed oil and white lead, should then be applied. The third coat, which is the ground for the finished colour, composed of white lead and linseed oil and turps in equal proportions, and, with an approach to the finishing colour, should be evenly laid on, the direction of the brush following the direction of the grain of the wood. This should dry out uniformly, and if it does not do so, should be repeated before the finishing coat is applied. By mixing varnish with the finishing coat, an egg-shell gloss is obtained, and this is the finish which appears to me most suitable for work generally. It does not require so much preparation as varnished work, does not show up slight unevenness, and will bear washing. It is sometimes called a bastard flat. If it is desired that the surface shall not shine at all, it will require a flattening coat of the required colour, mixed with white lead and turpentine only. Flattening should follow the previous coat about twenty-four hours after, before it has had time to get hard, so that it may be incorporated with it, and the more shiny the previous coat the more dead will be the flat.

OLD WORK

should be gone over with the stopping knife, then rubbed with pumice-stone and water; greasy parts should be washed with turpentine, and, where the paint is rubbed away, primed; cracks or holes should be stopped and hollows filled up, being left full to allow the stopping to shrink, and then levelled off afterwards. The first coat should be mixed with turps, and the succeeding ones as before described. Woodwork intended for varnishing requires extra care bestowed upon it from the beginning to secure an absolutely smooth surface, and, after the fourth coat, should be applied one or more coats of French oil varnish, or pale copal for delicate tints, being rubbed down between each coat with pumice-stone powder and water, and a felt float to remove all inequalities. This can be repeated until the work has the finish of a coach panel or a Japanese lacquer tray. Work of this kind is expensive, but very durable, and should be designed with this finish in view with very simple mouldings and large plain surfaces. It is, in my opinion, only under these conditions that internal varnished work is tolerable. It would be unwise to treat the work of a new house in this way before it had got over its infantile diseases. If it can be so arranged, a good plan is to leave a house with three coats of paint and lining papers on the walls for a season or two, when the

FINISHING DECORATIONS

can be carried out with the satisfaction that they are being executed on a good basis. Often the contractor who builds the house is not the best man to employ for the decoration, and one set of men is conveniently got rid of before the other commences. Some of the most beautiful colours can only be obtained by "glazing," the term given to painting with a semi-transparent colour mixed thin over an opaque colour. This is generally done with tube colours. In treating of house painting, the subject of graining should not be omitted, although out of favour at the present. Personally, I dislike it mainly for the reason that I never meet with any that is pleasant in colour. The merits justly claimed for it are that it wears well on account of its broken colour and varnished surface, and can be easily touched up without repainting. I see no reason why combed work, in colours not necessarily resembling wood, should not have a good appearance, also the merits claimed for grained work. I have some specimens which have been grained in one colour; then a second colour has been applied, and combed whilst wet, and afterwards varnished. Another plan is to stipple the second colour, and then varnish.

WALLS.

New walls, if intended to be painted, should be plastered with Parian or Keene's cement, and should have two coats of white lead and linseed oil and litharge mixed rather thin, to

soak into the plaster and stop absorption; the third coat should be thicker and mixed with spirits of turpentine and colour, and the fourth thicker still and mixed with equal parts of linseed oil and turpentine, with sugar of lead as a drier. The colour should be darker than intended to be finished, each coat should be allowed to dry thoroughly before the succeeding one is applied, and should be well rubbed down with glass-paper. The finishing coat is best stippled with large flat brushes, as a granular surface is obtained, the wearing properties are not impaired, and the unpleasant reflecting surface is broken up. Any appearance of damp must have the cause removed, as no tinkering with the face of the wall will be a lasting remedy. Any

PATCHING OR CHASES

should be made good with Parian or Keene's cement, which can be painted at once, provided that the bed or backing has been first painted with oil-colour to prevent the damp from the cement soaking into it. It is claimed for adamant plaster that it can be painted in twenty-four hours, but my experience of it is that this cannot be done with safety if cement has been used in the wall or floor, as the salt from the Portland cement will continue to come through for weeks after the plastering is done. The manufacturers recommend a wash of barium chloride, but this I have not tried. Another trouble which affects the finishing of walls is discoloration in patches where Fletton bricks have been used. I have spoken to the manufacturers about it, and am informed that it is caused by using overburnt bricks, and that a bricklayer experienced in the use of these bricks would not make use of these overburnt ones for inside work. Considering the very large quantities now being used in London in place of stocks, it is very important that the matter should be understood, the only remedy being to cut the brick out.

WALL-PAPERS.

The most convenient way of finishing walls, and that most largely adopted, is covering them with printed wall-papers. It is a simple process, and may be quite inexpensive, and they are easily cleaned off and renewed. Skilful paperhangers are not difficult to find, so a badly-hung wall-paper should not be tolerated. The surface of the wall should be rubbed over with glass-paper to remove all excrescence, and it should then be clearcoated, and the papers hung without joint from top to bottom, having their joints carefully trimmed and butted. On new walls it is a good plan to hang white lining paper preparatory to hanging a more expensive paper; this gives the latter a much better chance as far as discoloration from the fresh walls is concerned. Walls should be lined with brown paper before hanging embossed or strong papers, as otherwise they are liable to slide in shrinking, and open at the joints. It is a good plan also to line and clearcoat preparatory to distemping walls; it has an advantage over using a tinted paper, as the joints need not show, which they would do in the case of the distempered ground.

THE VARIETIES OF WALL COVERINGS

which may be suitably used for the space usually called the filling are numerous. Immense talent has of late years been employed in the designing of wall-papers, until we almost have more than enough, and there is a temptation, when choosing from a number of ambitious designs, to forget that in most cases the wall on which they are to be hung should be looked upon as a background—a purpose for which many of them are eminently unsuitable, and, if there could be more connection between the designing and the using of them, the designs and colourings would be very much modified. I am not now referring to the large flowered designs in natural colours which are exhibited in drapers' windows, accompanied by the notification that they can supply the chintz for hangings to match them. A less interesting arrangement I cannot conceive. A piece of English wall-paper is 12 yards long by 21in. wide, containing 63 square feet. French paper is 9 yards long and 18in. wide, containing 40½ square feet; so in estimating the quantity required, half must be added to the measure

for English papers, and the price considered in relation thereto. The simplest wall-paper consists of a pattern printed from a wood block, in repeats, with distemper colour on previously distempered roll of white paper, and in this form is suitable for use from the servants' bedroom to the principal reception-room, the dignity required depending upon the form of the design and colouring, and if we had nothing more than this we should still be very well off. The varieties of

EMBOSSED COVERINGS FOR WALLS

now available in decoration are numerous. They have the merit, when hung on an ordinary plaster wall, of presenting a wearable surface, and one that is capable of decoration after hanging in various ways, either by painting all over, particolouring, rubbed out, or stippled effects. The skill displayed in the Japanese leather papers in design, modelling, and treatment of the surface with metal and colours, made them very popular, and they have been used in place and out of place until we are rather overdone with them. A luxurious finish to a wall is covering it with silk damask or brocade, and this plan can be adopted with more propriety now the electric light is more general, and the dirt and discoloration from gas got rid of. It may be treated as a continuous band round the room, or introduced in the form of panels. In either case it should be so arranged as to have a solid back to prevent the accumulation of dust behind it. Lastly, I may refer to the hanging of real tapestry, which I consider has a value beyond any other wall covering, either as covering the entire wall, suspended from the top, or in panels. No other decoration is required, and a tinted white for the woodwork appears to give the best value to the tapestry colours. Following the order which I first laid down, we come to

FLOORS.

The ordinary deal floor, by the process of building, gets so stained and disfigured that it is necessary, if any part is intended to show, to stain it a dark colour and varnish it. A border around the room enables a reversible square of carpet to be used, which is easily taken up and shaken. The reception-rooms should be laid with hard oak or *jin*. oak parquet over the ordinary floor, which makes a very good job, provided the floor has got to its normal condition. It is best deferred for a season, as the best flooring will sometimes swell and buckle, when, if laid, the parquet will follow it and present a series of corrugations. The usual plan for finishing the oak is to give it a "stiffener" of French polish, and then brush over with beeswax and turpentine. Plain linoleum of its natural reddish-brown colour will be found serviceable and pleasant for many of the secondary rooms of the house. It is very durable, and, although I have heard something said about its rotting the boards through excluding the air, I have never found this to be the case. Before going on to the subject of colour, I may sum up in a few words the processes which I have been describing, omitting descriptions in detail of the materials, pigments, and vehicles used.

SURFACES WHICH HAVE TO STAND WEAR

should be painted with oil-paint, composed of white lead, linseed oil, and dryers. Zinc white is a purer white than white lead, but has not the covering capacity; it may be used with advantage for the finishing coats of light colours. Surfaces which do not come in contact with any bodies may be treated with less labour and as good an effect with distemper composed of whiting and size and the necessary colour. Oil surfaces may be made more durable by varnishing, the degree of finish being a question of labour and expense. It is important for the stability of painted decoration that pigments of a fugitive nature should be avoided, also that their chemical action, when mixed one with another, should be understood, and this subject has been treated of by Mr. W. J. Muckley in one of the handbooks of the Science and Art Department at South Kensington Museum. He therein gives a list of permanent, semi-permanent, and

fugitive colours, and practice might very well be confined to the use of the first two classes, if not of the first only. As house-painting must necessarily be renewed there is not quite the same necessity for absolute permanence as in a painted picture. The simpler the mixture of colours to produce the required tint the more likely it is to be satisfactory, and to keep its colour. I have read somewhere that the "quickest way to good colouring is through a short palette."

THE THEORY OF COLOUR

is treated exhaustively in the work of M. Chevreul, an eminent Frenchman, called "The Principles of Harmony and Contrast of Colours," and to those not acquainted with it I would recommend it as a winter's evening's amusement, as also the works of Owen Jones on the same subject, with his series of propositions on the principles which should govern the decorative Arts; but the best study for colour is the book of Nature, and to an enthusiastic student her instruction is infinite. Suggested schemes of colour are all around us. Combinations of clouds, the spring and autumn tints of trees, with their leaves back and front for colour or texture, fruit and flowers, the plumage of birds, vegetation on buildings, oxidising of metals, marbles—all present beautiful combinations which may be made use of, and an enthusiastic study of colour in the ordinary walks of life will well repay the time and attention given to it; in fact, my advice is, train the colour-sense simultaneously with that of form and proportion. When an impression has been received, take the earliest opportunity of registering your recollection of it with your colour-box; it will then be ready for use when the opportunity occurs. In a satisfactory scheme of decoration the three primary colours, yellow, red, and blue, should be in some degree represented, not necessarily on the walls of the room, but supplied by the hangings and furniture. They need not be represented in their primary condition, but in the form of secondaries and tertiaries. I should say that the

MOST USEFUL COLOUR FOR A BACKGROUND

on walls is green, contrasting with the furniture of yellow or red browns, with blue introduced in the hangings. Yellow being a primary colour, cannot be produced by a mixture of other colours; it is an advancing colour, has great power of reflecting light, and, compounded with red, gives the rouge of warm colours, orange and brown. It diminishes in power by artificial light, and for that reason is difficult to make satisfactory for both day and night effects. It is a delicate colour as a pigment, and is easily killed by admixture with other colours. It contrasts powerfully with black, and may be represented by gold in a colour scheme. Red is the intermediate primary coming between yellow and blue, and in like intermediate relation also to light and shade, white and black. It is a most positive colour, forming, in combination with yellow, the secondary orange range, and with blue, the secondaries purple, crimson, &c. It gives warmth to all colours, especially to yellow. In combination with yellow it becomes advancing, and with blue retiring. It is very much affected by the quality of the light in which it is viewed. Reds easily spoil one another side by side, and great skill is required to print one red on another satisfactorily. Red lights up by artificial light better than any other colour. Vermilion is the pigment which most nearly represents this primary. Blue is the third primary, and the coldest of colours. It is best represented by the genuine ultramarine, which is said to be a true colour, neither inclining to yellow nor to red. Blue is a retiring colour. The blues most used, on account of the high price of genuine ultramarine, are cobalt and Prussian blue; but the former inclines to purple by artificial light and the latter to green. These colours are very useful and pleasant in light tints for making greens, but, as blue lights up so badly, it may well be represented in the colour scheme by curtains or carpet. Having gone through the

usual processes in the decorating of a house, I will proceed to consider the points which should influence us

IN SETTLING ON A DECORATIVE TREATMENT,

and will commence with the vestibule. If the house is sufficiently large, this often becomes a room, with its entrance lobby screened off, and the staircase recessed from it or leading off from one side. It may contain an open fireplace, and the doors to the principal rooms open immediately out of it. It is therefore desirable that the colour should be considered in reference to the adjoining rooms. As the sunniest aspects are required for the living rooms, that of the hall is likely to be a northern one, and consequently a warm colouring would be best—a high wall panelling, or dark wall treatment to about the level of the top of the door architrave, with deep frieze of stencilled ornament in red tones, with an olive cornice, and the ceiling a lighter tint of the same. There would be very little blue or cold colour in this arrangement, and the fireplace might supply this in the form of blue tiles on a white ground and the grey metal of the stove. The old-fashioned crimson and blue Turkey carpet would complete the colouring, with a surround parquet floor, yellow stain being introduced in the window-glass. The red colouring could be carried up the staircase above a wall panelling, repeating the handrail on the wall side, or in the absence of this a wood moulding at this level, with the space below painted a greenish brown on a simple pattern embossed paper. This gives a durable surface where the wall gets most wear, and the papering above may reasonably be left unvarnished, as, except on the score of durability,

VARNISHED PAPERS

have nothing to recommend them. The varnish changes colour, and becomes in most cases very unpleasant, and is more susceptible to changes of temperature than an unvarnished paper, a sudden change from a cold day to a hot one covering the walls with moisture. An oil-printed paper on an oil ground is a good substitute, as it is pleasant in appearance and can be sponged without harm to it. We seldom now see the walls of a staircase panelled out in plaster. It has a good architectural character, and it is astonishing what can be done with a few hundreds of feet of wood moulding judiciously disposed on the walls. It is tedious making a drawing of the four sides of the stairs, so the best plan is to set out the panels on the walls with a piece of chalk. Everything above dado level can then be distempered. Duresco is a good material for the purpose, using the petrifying solution supplied with it. It is more expensive than ordinary distemper, coming between that and oil paint, but has the merit, when hardened, of being to some extent washable, and it is much less liable to discoloration from defects in the walls than ordinary distemper. It is also pleasant in appearance. The treatment of the walls of stairs suggested applies rather to old than new buildings. In considering

THE HORIZONTAL DIVISIONS OF THE WALLS

of a room, I have in mind the ordinary house, with rooms from 10ft. to 12ft. from floor to ceiling. The necessary skirting, if with about 6in. of plain face, is generally sufficient if of good thickness, with simple moulding receding to the wall, thickness rather than height being required; this will keep the furniture away from the walls without considering what is called the chair-rail, which should in most cases be lower than the back of a chair—from 2ft. 6in. to 2ft. 9in. to the top of it. The space between these two is best of wood, the face of it projected somewhat from the face of the upper wall. The skirting, plain or panelled, face and rail, should either be of one colour or of harmonising colours of the same depth of tone; to cut it up into thin lines is a mistake. Above this the wall may be plain and uninterrupted up to the frieze-rail. This with the frieze and cornice, about one-seventh the height of the room, should all be designed together and kept to about the same tone of colour, of sufficient weight to look like a part

of the wall. In designing these mouldings, mould the top of those below the eye and the bottoms of those above the eye. Another division as to height is to increase the frieze with rail and cornice to about one-fifth of the height of the room, giving the extra space to the frieze, and, if the room is very low, sacrificing or squeezing the dado. In a drawing-room this plan will be found convenient, as pictures being generally small will not look well skied, and

THE ORNAMENTAL FRIEZE

furnishes and gives interest to the upper part of the wall. If there is height enough, the cornice mouldings of the treatment last described can be moderated in size to form the starting of a cove or hollow, connecting it with other mouldings to form the frame of the ceiling. The cove, so very general in the French work of the last century, is very much out of fashion, but is undoubtedly very serviceable in preventing the disruption between the decoration and walls and ceiling. If there is not height enough for a cove, the cornice kept down a few inches from the flat of the ceiling will give an opportunity of adding recessing mouldings, and preventing the sagging appearance of an absolutely flat ceiling. For bedrooms, the deep frieze arrangement is very suitable, either with or without the dado, according to the height of the room. It is a good plan, when arranging window-casings and architraves, to break the cornice out so as to form a boxing for the top of the curtains. The breaks have a good appearance, give good shadows falling on the curved surface of the curtains, and prevent the accumulation of dust.

(To be continued.)

BRICKWORK TESTS.

THE tabulated statements appearing on this page were submitted at the meeting of the R.I.B.A. on the 13th inst., when the third report on brickwork tests was presented by the Committee. Table A has been prepared by the Committee, and B by Professor Unwin in order to explain his criticism of the tests as carried out. His table refers to all three stages of the experiments, while that of the Committee deals only with the third of the series. Professor Unwin's contention is that there has not been an exact supervision of the quantities of sand and lime used in the mortar, which was employed for erecting the walls upon which the tests were made. He attributes the difference in the results of the tests to this circumstance, and, therefore, emphasizes the importance of considering them in the form shown in his table, as a more simplified method of viewing the whole series of experiments. The committee state that they obtained these figures by taking one-fifth of the crushing load which they had observed, but Professor Unwin urges that that should not apply to piers less than three months old, because, in a great many cases, it is not the strength at three months but at one month that should be considered in brickwork tests.

The St. Bride's Press, Ltd., are about to publish a book by Mr. Sydney Perks, A.R.I.B.A., P.A.S.I., entitled "Party Structures," dealing with Part VIII. of the London Building Act, 1894, and party wall procedure generally. The work will be found very useful to architects and others, as it will include a report of all important legal decisions to date.

L.C.C.

ALTERATIONS IN CONTRACT CONDITIONS.

CONTRACTORS for London County Council work will be interested in a series of alterations in the conditions for contracting, that received the confirmation of the Council at a recent meeting. The General Purposes Committee submitted the report upon the proposed changes, and the first recommendation dealt with the clause compelling the contractor to observe "the rates of wages and hours of labour recognised and in practice obtained by the various trade unions," which they proposed should read: "the rates of wages recognized by associations of employers and in practice obtained by the trade unions."—This was agreed to.—The Committee further recommended that the radius within which the Council's regulations as to wages and hours of labour operated should be 12 miles in a straight line from Charing Cross, instead of 20 miles as previously.—Mr. Burns, M.P., moved as an amendment that the recommendation should be referred back. He said the existing arrangements had worked satisfactorily for the past five or six years, and no valid reason had yet been brought forward for the alteration now proposed.—Mr. Crooks seconded the amendment.—Sir Arthur Arnold urged the adoption of the recommendation on the ground that it established, as the existing rule destroyed, that which had been the policy of the Council—namely, to follow the trade unions and their employers, and not to fix the rate of wages itself. Because the recommendation followed exactly the rule adopted by the

TABLE PREPARED BY PROFESSOR UNWIN.

Master Builders' Association of London, and the trade unions connected with the building trade, he appealed with confidence to the Council to adopt it.—After further discussion the amendment was lost, and the recommendation of the Committee adopted. The clause in contracts giving the clerk of the Council power to direct the production of "the time and wages sheets and books of the contractor and all other evidence necessary or proper" to show that the stipulations of the Council were being complied with, was altered to read "time and wages books and sheets of the contractor."—Mr. Burns, M.P., moved an unsuccessful amendment to refer this recommendation back. He pointed out that the clause had worked well, and there was no reason why the power of the Council over contractors should be in any way watered down.—The penalty of £3 for a breach of the stipulation by the contractor to produce time and wages books and sheets is to be left out.—The Council further agreed to omit the clause relating to the penalty for a breach of the stipulation as to the schedule list of wages being displayed at the works of the contractor.—A new arbitration clause was also agreed to, embodying the principle that no outside arbitration should take place except after completion of the works. The old form of the clause involved two arbitrations, but under the new clause only one arbitration is provided for.

TAXATION CHARGES ON SITE VALUES.

The Council, at a subsequent meeting, considered a report of the Local Government and Taxation Committee, who amongst other recommendations proposed: (a) That it is advisable that a new source of revenue should be obtained by means of some direct charge upon owners of site values. (b) That this charge be termed "owners' tax." (c) That all persons deriving a revenue, or use equivalent to revenue, from the value of a site, be liable to pay such charge. (d) That the site value of every property be assessed and entered in the valuation list. (e) That the site value be the annual rent which at the time of valuation might reasonably be obtained for the land as a cleared site if let for building by an owner in fee, subject to an equitable reduction in exceptional cases in which the full site value thus defined is not being enjoyed or obtained by any person or persons. (f) That in view of the fact that considerable expense has been incurred from public funds which has largely contributed to the increase of site value, the Royal Commission be asked to recommend that such owners' tax commence at the rate of 6d. in the pound, and rise gradually to such sum as Parliament may determine, and that any increase of burden or expenditure for new services should be equitably shared between the present rate on occupiers and the proposed owners' tax. (g) That any existing or future contract or agreement by which an owner purports to exempt himself from the owners' tax, or to cause it to be paid by any other person in his stead, be invalid. (h) That vacant land and empty property shall be liable to pay the owners' tax upon the site value as appearing in the valuation list.—After discussion, the further consideration of the report was postponed.

THE WORKS DEPARTMENT.

The Finance Committee have presented their statements for the half years ended on March 31st and September 30th last. During the six months terminating in March there were thirteen separate works carried out. The final estimates for all amounted to £24,099 11s. 10d., and the actual cost was £25,563 3s. 3d., showing the total cost above the estimate to be £1463 11s. 5d. The heaviest work was in connection with the Wandle branch sewer, which cost £12,011 3s. 6d.; while the estimate was only £9,665 9s. 2d. It will be seen that but for the difference here shown there would have been a balance on the right side on the other works, most of which cost less than was estimated. The jobbing works done during the same period were of the schedule value (or probable contract value) of £16,758 17s. 2d.; but the actual cost was only £15,869 6s. 6d., being £889 10s. 8d. less. There has been, in fact, a saving of seven per cent. in the jobbing works during the last two years. The statement for the half-year ended September 30th shows that seventeen different works were then completed, several of them of an important character. The total of the final estimate for these works was £171,049 18s. 11d., and the actual cost £192,410 1s. 6d., making a difference of £21,360 2s. 7d. The largest differences are £7923 in the case of the Bexley Asylum (cost £39,230), £2266 for Vauxhall temporary bridge (cost £13,532), £1936 for Whitefriars fire station (cost £22,527), £6646 for the Fulham and Hammersmith sewer (cost £31,014), and £1920 for central works (cost £21,130). The Committee make two observations with regard to the five works which show large excesses of cost over final estimate. First, that at any rate during some portion of the time while these works were in course of execution, the Works Department was undergoing investigation, which was followed by considerable changes in the staff; secondly, that the present manager, Mr. Adams, is not responsible for these works, as they were practically completed before his appointment on February 2nd, 1897. Altogether the works executed by the Works Department since its creation, till September 30th last, were in the final estimates set down at £630,822, while the actual cost has been £655,307.

The tower of Bala College is to be reconstructed at a cost of £960.

IMPROVING A CITY CHURCH.

SOME rather misleading statements have appeared concerning the alterations which it is proposed to make to the churchyard of St. Andrew's-by-the-Wardrobe, Queen Victoria Street. The real facts of the case are as follows:—When Queen Victoria Street was constructed the pavement of the street itself was at such a much lower level than the churchyard of St. Andrew's, that a lofty and singularly ugly retaining wall was built to support the latter, and a very inconvenient flight of steps was carried up to the south doorway—so precipitous as to be dangerous, especially in the case of aged persons. It is now proposed to remedy these evils in the following manner: To the rear of a shop which abuts on the churchyard is a piece of waste land measuring, roughly, a hundred square feet. This is the property of the church, but is of little or no use to its present proprietors, though it would be of considerable value to those who possess the street frontage. Now the owner of the shop in question has offered to purchase this plot of ground, provided that the Ecclesiastical Commissioners will give their consent to the sale. The sum which would be realised by this sale would, with the exception of about one hundred pounds, suffice for the carrying out of

A MUCH-DESIRED IMPROVEMENT.

both to the church and to Queen Victoria Street. The ugly retaining wall, which blocks out the pretty view of the church from the street, would be replaced by a low wall, 2ft. or 3ft. high, crowned by an open railing, the churchyard being gradually brought down to the level of the street by a series of terraces, and the present "breakneck" steps replaced by a double flight arranged far less abruptly. This would certainly be a very ornamental addition to the City, for although the church of St. Andrew is not one of Wren's most brilliant achievements in ecclesiastical Architecture, its well-designed flank and tower, with their ruddy brickwork enlivened by handsome stone-carving, would form a most agreeable contrast to the somewhat monotonous aspect of Queen Victoria Street, if they could only be properly seen from below, which is at present impossible. It is to be hoped that the rector and churchwardens may be supplied with sufficient funds for the purpose. The effect of a church supported upon terraces and approached by well-arranged flights of steps is always attractive, as those know who have in their mind's eye La Trinité de Monti at Rome, St. Vincent de Paul, Paris, or the Cathedral of Gerona in Spain. Although St. Andrew's Church, as we see it at present, dates from after the Great Fire of London, it is the successor of a church whose records can be traced back to the thirteenth century. It did not always bear its present name, but was formerly known as "St. Andrew's, Puddledock"—from a small kind of harbour or creek leading from the Thames. The present title is derived from an ancient palace or tower in which the Royal robes of ceremony were deposited, and in which at times the kings themselves resided. The church was also sometimes described as "St. Andrew's, Baynard's Castle," because it stood close to that ancient fortress. In more modern times the church has been conspicuous for its two eminent rectors, the Rev. W. Romaine, the celebrated preacher—whose beautiful monument by Bacon is one of the chief ornaments of the interior of the building—and the Rev. W. Goode, the founder of the British and Foreign Bible Society, and of the first Sunday school established in the City of London. The interior of St. Andrew's has been elegantly restored by the present rector from designs by Messrs. Bodley, A.R.A., and T. Garner, every object of interest in the building being carefully preserved or replaced.

At a meeting of the Executive Committee of the Swansea Harbour Trust it was resolved to recommend the Trust to spend £100,000 on works authorised by Act of Parliament, including a new lock, measuring 400ft. by 60ft.

Professional Items.

BRADFORD.—Sketch plans have been completed by Messrs. T. H. and F. Healey, of the new church to be built in the parish of St. Andrew's. The style of Architecture proposed to be adopted in the new structure is the late decorated Gothic, verging on perpendicular, and the church is to include a nave, north and south aisles, a chancel on the north side, north and south transepts, a tower at the west end, and vestries for clergy and choir. Seating accommodation is to be provided for about 800 persons. The site has been presented by Mrs. Turner, of Westfield, who has also offered to give £1000 to the building fund and £1400 to the endowment fund, whilst Mr. Turner has promised 2000 guineas to the building fund.

BRISTOL.—The Inland Revenue building in Baldwin Street is completed, and the Scottish Widows' Fund building is just rising above the hoarding. The frontages are in stone with granite bases, and the floors throughout are of coke-breeze concrete, the steel pillars and beams being protected against the action of fire by a concrete or brick casing. In the basement, moreover, are several strong rooms. Light and air are essential requirements for health's sake, and though little valued by the builders of old Bristol, will be more and more studied by the builders of the new. Here particular pains have been taken to secure an ample supply of both throughout. The sanitary arrangements, too, are thought worthy of study, and the most modern appliances will be fitted up. The architects are Messrs. W. Dunn and R. Watson, of 21, King William Street, Strand, London, and Mr. A. J. Beaven, of Dean Lane, Bedfordminster, is the builder.

BRIXTON.—The new Gresham Baptist Chapel, facing Gresham and Barrington Roads, Brixton, has recently been opened for public worship. The former chapel was partially destroyed by fire nearly two years ago, and after some delay in seeking a new site, the building committee decided to pull down what remained, and rebuild on the old site. The foundation stones were laid early in the year. The elevations are in the Italian style of Architecture, and are of yellow malm bricks, with Portland stone dressings. The building consists of a basement for heating purposes; chapel on the ground floor, with entrances from both roads; deacons' and minister's vestries. The seating accommodation is for 475. There are two entrances, and separate staircases to gallery, and also two entrances and staircases to schoolroom, which is placed above the chapel, on either side of which are arranged class-rooms for boys, girls, and infants' kitchen, w.c., lavatories, &c. Messrs. Whitehead and Co., of Clapham Road, are the contractors for the general works; Stuart's Granolithic Co. for the fire-resisting floors, which have been covered with wood blocks by the Westminster Flooring Co.; Messrs. Ward and Co. for the staircases; the Educational Supply Association have executed the seating for both schoolroom and chapel in pitch pine; and the gas arrangements are by Messrs. Sugg and Co. The organ is by Messrs. Samuel and Twyford, and the total cost has been about £5000. The architect is Mr. J. William Stevens, of No. 21, New Bridge-street, E.C.

BURNTISLAND.—About 26 double villas are to be built on the Dick Trust Ground. Messrs. Swanston and Legge, Kirkcaldy and Burntisland, are the architects.

DUBLIN.—The reconstructed Theatre Royal, Dublin, has been opened. The work was entrusted to Messrs. H. and J. Martin. The Hawkins Street frontage has been altered by the erection of a graceful portico on the site of the verandahs that formerly occupied the front of the Leinster Hall. The pediment is supported on light Ionic columns, and is surmounted by an Italian balustrade. This structure, which rises to about half the height

of the frontage, harmonises agreeably with the other portion of the old frontage of the Leinster Hall. What was known as the vestibule of the Leinster Hall has been considerably curtailed, and from this point two splendid marble staircases lead up to the dress circle. The ceiling of this part of the house is a notable piece of emblematic Art, and the painting has been done in exquisite style by an Italian artist. The auditorium is 80ft. in depth by 64ft. in width, and the inside width is 31ft. The stage measures 64ft. square, and the height from the floor to the gridiron roof is 60ft. The front of the tiers is ornamented with a handsome design in fibrous plaster, executed by Messrs. Binns, of Birmingham, this being picked out in gold and colours.

EDINBURGH.—A new school at the corner of East Preston Street and Dalkeith Road has been opened. The building, which is of a Flemish design, presents no special architectural features. It is three stories in height, and contains accommodation for 900 children. The cost of the site was £3538, and the expense of building and furnishing the school was £11,800. It is fitted with hot water of the most perfect system, and fresh air is introduced into the building by passing it over hot-water pipes, and vitiated air taken out of the classrooms by means of large openings.

GATESHEAD.—New School Board offices have been recently erected from designs prepared by Mr. Edwin Bowman, architect, of Newcastle, which were selected in open competition in May, 1896, out of 11 designs submitted, the cost being limited to £3500. The buildings are of red brick with moulded and carved stone dressings, and present a handsome and imposing appearance. The entrance to the various parts of the building is by a stone portico, with stone columns and entablature, into spacious and well-lighted corridors and vestibule from which are entered the various rooms. On the ground floor is placed the general office, a splendid room 44ft. by 19ft., adjoining which is the private office of the Clerk of the Board, book-keepers' room, telephone room, strong room, and waiting room. The attendance officers' rooms are placed at the north end of the building, and have a separate entrance to them as well as communication with the other offices. The first floor is approached by a wide and handsome staircase, and on this floor is placed the Board Room, 35ft. by 26ft. This room is 15ft. high, with panelled plaster ceiling and panelled wood dado. Adjoining the board room is the members' private room, with cloak and retiring rooms thereto. The waiting room, committee room, and other rooms are all contiguous to the Board Room, all of which are entered from a spacious hall on this floor. Lavatories and cloak rooms are provided on each floor, and the sanitary arrangements are of the most modern type. The ventilation of all the rooms has been specially looked after, and all are warmed by hot-water pipes and radiators on the low pressure system, which is supplemented by open fires in each room. In the basement are placed store rooms and the heating chamber. The contract for the buildings was £3482, and has been carried out by Messrs. T. and R. Lamb, of Gateshead, under the personal supervision of the architect, with Mr. Wm. Edington as clerk of the works for the Board.

LEEDS.—A Local Government Board inquiry has been held at the Leeds Town Hall with reference to an application by the Corporation to borrow £15,000 for the purpose of erecting baths in Meanwood Road, on the site lately known as the West Riding football ground. The town clerk stated that the baths were the last of a set of five decided upon by the Corporation some years ago. The area of land to be acquired is 3806 yards, the price being 16s. per yard, and the total expenditure is estimated at £14,366.

LISGRIFIN (IRELAND).—The dedication of the new church at Lisgriffin, in the parish of Buttévant, marked an important event, not only in the history of the diocese of Cloyne but in the Church of Ireland, for the old

thatched chapel that hitherto served the needs of the people of this part of the parish of Buttévant had stood for over two hundred years, and was one of the last relics of the penal days in Ireland. Many are the traditions connected with the primitive structure, of cruciform shape, with its thatched roof, earthen floor, and rudely built stone altar. The new church is of rectangular shape without gallery or transepts, and built of native limestone similar to that used in the old castle of Lisgriffin adjoining. It is a plain, well-finished building in the Gothic style, light and graceful in appearance. It measures 100ft. in length, 30ft. in width, and 40ft. in height to the bell turret. The roof is of pitch pine, and the church is lighted by numerous windows. These are composed of various tints of rolled cathedral glass, with ruby and amber borders, the whole producing a pleasing effect in tone and light. The architect was Mr. Samuel F. Hynes, Cork, and the builder, Mr. Thomas A. Walsh, Charleville and Kilmallock.

LITTLE COGGESHALL.—St. Nicholas' Chapel, Little Coggeshall, Essex, has been reopened and dedicated after restoration. The chapel was built by the monks of the Cistercian Order about 700 years ago. It is of a simple quadri-lateral design, without aisles or transept. It is constructed of rubble consisting principally of flints and fragments of Early English brick, and it is one of the earliest instances, if not the earliest, of moulded brickwork in the kingdom. Many years ago this sacred building was converted into a barn, part of the south wall being removed and a wing attached. This unsightly addition was, however, subsequently demolished, and later restoration commenced. The plans were prepared by Messrs. Bodley and Garner, ecclesiastical architects, and the restoration was carried out by Messrs. Rattee and Kett, of Cambridge. The style of the ancient architecture has been affected as little as possible. The old reed thatch has been taken off, and where it was necessary to supplant the old timbers of the roof by new, the new ones have been made to correspond. The western portion of the roof has been raised to a level with the eastern half, and the whole is covered with old plain tiles. In the same manner the restoration has taken place within and without. The only part left unrestored is the sedilia. The east window (the old moulded brick mullions of which still remain, as they do also in the west window) is of stained glass.

NEWCASTLE.—A new font has been dedicated in St. Thomas's Church, Barras Bridge, Newcastle. The font, which was designed by Mr. Hicks, is of white Caen stone, octagonal in form, and is richly traceried and carved all over. The bowl, of one large block, has its sides slightly concave, and their traceries support shields with symbols and monograms. The font is raised upon a traceried stone platform, with a kneeling step round it. The work has been carried out by Mr. Robert Beale, of Newcastle-on-Tyne.

ST. GEORGE'S (ISLE OF MAN).—The sub-committee appointed by St. George's Church Council to make inquiries and report, in reference to the advisability of restoring or rebuilding St. George's, have held a meeting to examine the plans and estimates. The Lord Bishop thought that, if to make a complete restoration the church had (as he understood had been recommended by the architect) to be absolutely gutted, it would be well to consider whether the outer walls were worth keeping. They had been patched on several occasions, and had no pretence to ecclesiastical Architecture. He believed that more money would be given, and more readily given, for a new church than to renovate the old one. He suggested that the architect might be asked whether it was possible to improve the outer walls, and to give a plan of the elevation. He could see that there was some difference of opinion as to what ought to be done; he would therefore advise the making of further inquiries before attempting to come to any decision. Ultimately a resolution was passed asking the architect to prepare a plan of the elevation of the old church, with any improve-

ments to the outer walls which he could suggest; and to estimate the cost of such improvement. Also to give plan and cost of a new church to be placed on the same site, and to provide like accommodation.

STAUNTON-ON-ARROW.—The church in this parish has been re-opened, after having been closed for a period of ten weeks for restoration. The work has been carried out by Messrs. Smith, of Kidderminster; under the direction of Messrs. Nicholson and Hartree, diocesan architects. It comprises entire re-roofing and other structural renovations and improvement, including a hot-water apparatus.

UPPINGHAM.—New workshops have just been completed for the Uppingham School. The accommodation comprises large metal and carpenters' shops, each with instructor's office, and fitted with every convenience, store, etc. The walls are of stone with freestone dressings, floors of wood block, and open timber roofs are covered with Colleyweston grey slating. New isolation wards for the school sanatorium have also been erected, with four wards, each for two beds, nurses' rooms, bath rooms, kitchen, nurses' bedrooms, etc. The floors are fireproof and the walls are plastered with adamant; all angles rounded. The walls are of stone and the roof is tiled. The dining-room, kitchen, etc., of sanatorium have been enlarged, and new entrance porch erected, also new ambulance house. The workshops have been built by Messrs. Dorman and Scott, and the isolation wards and additions to sanatorium by Mr. W. Dean, from designs, and under the supervision of, Mr. J. B. Corby, architect, Stamford and Uppingham.

THURSO.—A new Post Office is being erected at Thurso (Scotland). The building is not architecturally ambitious, but it is conveniently situated and amply commodious. There is also ample space for its extension, should the future require it. The site has a free vehicular track right around. This of itself will be an advantage in the busy season. The style of frontage has been well chosen by the architect, Mr. Sinclair McDonald, as being in harmony with the Architecture of the locality. The public office is, in round figures, 29ft. by 23ft., while the sorting-room immediately behind is 29ft. by 24ft. The telegraph room is 20ft. by nearly 14ft. Behind this is the Postmaster's room, which is 14ft. by 12ft.; while there are a number of rooms for stores, batteries, retiring rooms for men and women, with every other accommodation that modern science renders indispensable. The whole length of the building taken up by the Post Office is 86ft., while the width is 29ft. 4in.

WHITLETS (AYR).—It is proposed to erect shops and dwelling-house here on plans by Mr. John Macintosh, Galston. The successful contractor is Mr. David Campbell, builder, Ayr, and it is expected the building will be commenced at once. The schedules are by Messrs. Service and Bisland, surveyors, Kilmarnock and Ayr.

WOLVERHAMPTON.—The foundation stone of the new additions to the North Wolverhampton Working Men's Club has been laid. The new additions comprise large reading and smoke rooms and spacious billiard room. The elevation adopted is of a pleasing character, and special attention is being paid to the heating and ventilating of the buildings. The contract is upwards of £900, and has been let to Mr. Benjamin Guest, of Wolverhampton, and the whole of the work is being carried out from the designs and under the supervision of Mr. J. Mason, architect, Wolverhampton.

WORKINGTON.—The Workington Town Council has resolved to contribute £100,000 towards the cost of the construction of a new deep water dock on the south side of the existing harbour. Lord Lonsdale's interests are to be bought out, and traders connected with Cammell's, Moss Bay, Lowther, and Workington hematite works are pledged to contribute not less than £75,000. The estimated cost of the dock is £300,000. A bill will be deposited in the next session of Parliament.

Correspondence.

MR. R. STEPHEN AYLING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Recently a circular relative to one of our publications has been sent to members of the architectural profession. The illustrator, Mr. R. Stephen Ayling, is described as a gold medallist of the Royal Academy, and by his desire we beg to state that this is a clerical error. The position Mr. Ayling holds is that of silver medallist. Will you kindly allow us to trespass upon your space by inserting this letter in your next issue?—Yours truly,
E. AND F. N. SPON, LIMITED.

THE GROWTH OF TREES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—As in the course of business I have had considerable experience in the felling of English timber, it may be of interest to your readers to know some of the theories which have occurred to me by observation in regard to the growth of it, particularly as to the specific queries of your recent correspondent.

His first query is well answered by yourself, but I should add that the vertical growth of the cells is much more, proportionally, than the lateral growth; with this remarkable point, the vertical growth continues long after the lateral growth has ceased. And passing to the second query, this vertical growth is fed from the outside sap wood or alburnum, through each successive medullary ray.

My theory as to the course of the sap is that it passes up the cambium layer and the exterior alburnum, then laterally through it into the duramen, the excess descending through the heart of the tree into the "tap" root, which grows into the earth of a different nature to the other roots, apparently fed by the return sap, robbed of its salts in a measure, and of a nature suitable to its purpose.

When sawing down elms I have often had them bored with an augur about 1ft. above the crown of the tap root previous to cutting, and, if felled about December, have extracted perhaps a bucket of sap from one tree, which runs from the centre of it. This is, I believe, the sustaining fluid for the growth of the tap root during the winter. The amount of sap in the cambium layer not absorbed through the alburnum into the duramen, I think, is partially taken up by the astringency of the bark, and the surplus passes again to the roots to feed their growth during the winter.

Briefly, my theory by this is: that in the summer the tree is growing while the roots feed it, and in the winter the roots are growing fed by the tree, as I have shown it.—Yours truly,
EXPERIENTIA.

Dec., 1897.

A SUBSCRIBER.—We shall be pleased to see your illustration of the gateway tower at Lancaster Castle.

THE INSTITUTE EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I read with great interest your recent leader on "Some Anticipated Regrets," and should like to be allowed to make a few remarks thereon. Having the honour to be a member of the Institute, I wish to protest against what I consider to be "B.C.'s" exaggerated ideas of the evils of the examination system, and should like to remind him, what has been pointed out over and over again, that the Institute does not profess to examine in Art, but merely in those branches of Architecture which it is essential for an architect to know. In my opinion, the examination is a great help to young architects, as it requires from them a certain amount of knowledge to be gained, and therefore stimulates them to study and industry, which might not be the case if they were left to their own devices, and if they possess the artistic instinct (which everyone studying for an architect ought to possess), it will be trained and strengthened

by a proper study of the past styles of Architecture, and in this manner will enable them to design with power. As Dr. Collins pointed out at the Institute dinner the other night: "Architecture had been described as frozen music," or harmony crystallised into form." If one wanted to be a musician or a composer, no matter how great a genius he is, he must start with the scales and study harmony, counterpoint, &c., before he can compose. The same applies to Architecture. As Architecture is a constructive Art—or the Art and science of building beautifully—and not a purely artistic calling, like that of painting, I have come to the conclusion that, however much architects may differ in their ideas as to their professional education, registration is the only remedy. This would, of course, mean a qualifying examination. In these days of keen competition, nearly every profession is protected, and one can only wonder that all architects do not recognise the great value of this, as it would raise the status of the Profession considerably, and would also prevent outsiders from calling themselves architects; we should also not be so subject to the many insulting conditions issued by ignorant competition committees.—Apologising for trespassing on your valuable space, I am, yours faithfully,
ERNEST R. DANFORD.

116, Sydenham Road, Croydon, Dec. 11th.

Enquiry Department.

FELLOWSHIP OF THE SANITARY INSTITUTE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you let me know the requirements of the Sanitary Institute, to become a Fellow?—Yours faithfully,
J. L.

Fellows of the Sanitary Institute are elected by the Council from the members of at least one year's standing, on one or other of the following grounds: 1. That he is an eminent man of science; 2. That he is a person of distinction as a legislator or an administrator; 3. That he is a person who has done noteworthy sanitary work. On election, Fellows pay a fee of five guineas. Donors of £1000 to the Institute are also eligible as Fellows. Every person recommended for admission as a Fellow must be proposed and recommended in the form prescribed by the Council, which form must be subscribed by at least three Fellows, one of whom must sign from personal knowledge of the person recommended. Form "B" is the one required for the nomination of a Fellow. For honorary Fellowship, foreigners distinguished in connection with sanitary science can be elected by the Council. Honorary Fellows are not corporate members of the Institute, however.

CHIMNEY SHAFTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you inform me, through your enquiry column, the rule used for obtaining thickness of walls, &c., and proper balter for a chimney shaft, say 350ft. high, and give sketch of best section for same. Trusting you can help a puzzled student,
SHAFTS.

It would be difficult to find more concise or correct information about the erection of chimney shafts than that contained in Section 65 of the London Building Act, 1894. The taper is there regulated to be not less than 2½in. in every 10ft. of height, while the thickness of the brickwork at the top of the shaft and for 20ft. below is fixed at 8½in. at least, this to be increased at least one half brick for every additional 20ft. measured downwards. A section of a shaft of 160ft. high, designed by Mr. C. S. Peach, is to be found in "Stresses and Thrusts," published by Batsford. The chapter in which it occurs is worth reading, as is the whole of the section of the Building Act mentioned above.

A HANDSOME figure memorial of the late Sir Augustus Harris has been placed in position in Brompton Cemetery.

Under Discussion.

THE WINTER SESSION.

THE ARCHITECTURAL TREATMENT OF GABLES.

A meeting of the Glasgow Architectural Association was held on Tuesday, the 7th inst., the president, Mr. W. T. Conner, in the chair. Mr. Alex. Wingate read a paper, entitled "The Architectural Treatment of Gables." The lecturer confined himself to treating the subject in a general historical manner, tracing the development of the gable through its different phases from the Greek tympanum to the variable quantity of the present day.

BYZANTINE CHURCHES.

Mr. Sydney D. Kitson delivered a lecture to members of the Leeds and Yorkshire Architectural Society, on the 13th inst., in the Leeds Institute of Science, Art, and Literature, the subject being "Some Byzantine Churches in Greece." Mr. George Corson (president) occupied the chair. Byzantine Art, Mr. Kitson said, was connected with the youth of Christianity, and had maintained its traditions to the present day. Many lessons were to be learned from it—lessons of construction and design. He went on to describe some of the mediæval churches of Greece, most of which, being small, had been almost entirely disregarded by travellers. The builders of the old Byzantine churches, Mr. Kitson remarked, did not strive after effect; they knew that by expressing themselves truthfully they would obtain a beautiful building.

MODEL DWELLINGS AT DEPTFORD.

On Saturday, December 10th, the Goldsmith's Institute Building and Architectural Society paid a visit to the several blocks of model dwellings being erected in Deptford for the South Eastern Railway Company. The site, adjoining a canal, is extremely convenient for the carriage of the necessary materials, which are unloaded from the barges and placed in trucks running on light rails, and thus conveyed to any part of the site as desired. The dwellings are being erected to house the people that will be displaced by the widening of the Company's line between New Cross and London, the number to be accommodated being 1080. The site being made-up ground, it was found necessary to carry the foundations to a considerable depth, this being executed by concrete piers every 7ft. or 8ft., over which arches were turned of the same material. The site is divided up into seven blocks, having some 40ft. between them, thus securing ample air space and light. The blocks are planned on the two and three-roomed tenement system; the two-roomed tenements consisting of a living-room, bedroom, kitchen, scullery, and w.c., this meeting the requirements of a family of four. The buildings throughout are constructed of fire-resisting materials, the floors and roofs being composed of coke-breeze concrete, carried by steel girders, the roofs being rendered watertight by a double layer of asphalt. Easy access has been made to the roof, so that it can be used for a drying or playground. The staircases are built with glazed bricks, the steps being Stuart's Granolithic material, specially moulded. On each landing is fixed a hopper which is connected by a shoot with a movable receptacle for house refuse on the ground floor, thus doing away with the necessity of carrying the refuse down the stairs. Special attention has been paid to ventilation and other sanitary arrangements, and no trouble has been spared to make a comfortable home for those who are to occupy the tenements. The dwellings are the design of Messrs. Humphrey and Davies, and are being erected under the superintendence of Mr. Jenkins, the clerk of works. The afternoon's visit terminated by passing a hearty vote of thanks to the architects for permission to view the dwellings, and to Mr. Jenkins for conducting the party round and supplying much interesting information.

ART METAL WORK.

"Art Metal Work in the Black Country" was the subject of an interesting address, delivered to the Dudley Literary Society, by Mr. James Smellie. The craftsman of the future, said the speaker, must also be a designer, or at least he must be acquainted with the rudiments of art. This he considered was the great secret of the much-talked-of German competition. Technical schools are all very well, but art schools must be combined with them if any really important results are to be achieved. "If," said Mr. Smellie, "Dudley, Halesowen, and the district had been in Germany, they would have had a combined Art and Technical School erected by the State and equipped with all the most modern and scientific apparatus for the teaching of Art metal work and all other trades which would benefit the town, the district, and the country."

WARMING OF PUBLIC BUILDINGS.

The monthly meeting of the Sheffield Society of Architects and Surveyors was held on the 14th inst. The president, Mr. R. W. Fowler, F.S.I., occupied the chair. Mr. F. R. Farrow, F.R.I.B.A., of London, delivered a lecture on "The Warming of Public Buildings." After some introductory remarks, defining the class of buildings included under the term "Public," the lecturer proceeded to describe the various methods adopted in the warming of public buildings, first of all treating the hot air systems and the objections to them, then the general principles and methods of heating by low pressure warm water and high pressure hot water, together with their respective advantages and disadvantages, describing in detail the arrangements and materials of the pipes used in each case. The lecturer also dealt with the various methods employed in the use of steam for heating public buildings by means of low pressure, high pressure, and exhaust steam, with the merits and defects of each; pointing out the various classes of buildings to which these methods are especially applicable. Each system was shown to have its own particular merit and peculiar suitability to certain classes of buildings, it being pointed out that there is no one system which is universally superior to all others, nor even successfully applicable in every case. Having dealt with general principles, the details of various fittings and apparatus were explained, the several types of radiators and their methods of employment, the different kinds of boilers with the particular purposes for which they are best suited, the forms and uses of stop valves, steam traps, and other minor but important features. Questions involved in the calculations necessary to determine the heating power and apparatus required for different buildings were then explained, and the criterion of efficiency determined. The lecture concluded with an exhibition and explanation of plans.

GIRDERS.

Lecturing to the Northern Architectural Association on the subject of girders, Mr. W. S. Vaughan, C.E.M.E., first described the various kinds by the technical expressions, and then went on to refer to the stress, strain, and four major strains. Their powers of compression, tension, shearing torsion, and modules and limit of elasticity were all well defined. By the aid of models and black-board sketches he illustrated the bending moment, the neutral axis and neutral surfaces, and compared the results with ordinary girders. He next gave a mathematical description of the magnitude of stresses, and alluded in detail to the designing of girders, comparing the material to be used, emphasising the importance of viewing it from a safety point of view. Examples of well and badly designed girders, flitch plates, etc., were illustrated, and the lecturer explained how a maximum of strength could be obtained with a minimum of material. In conclusion, he dealt with the manufacture of steel, comparing the several kinds, and also drew a comparison between the weights of girders of equal strength in steel, wrought-iron, and cast-iron. After the lecture Mr. Vaughan presented the models to the Association.

Trade and Craft.

A NEW ARTIFICIAL STONE.

A large party of architects and builders visited Worplesdon, near Woking, the other day for the purpose of inspecting a new process of manufacturing artificial stone, which has been patented. The stone is formed in steel moulds, which can be adjusted to any size, shape, or design for which the finished stone may be required, but so far as was visible solid blocks of several hundredweights in weight were most easily produced. The object of the inventor appears to have been to compass the results which have been attained by nature in the course of many centuries in a few days, and it has even been claimed for the new invention that it is really only a rediscovery of the secret which enabled the enormous blocks of the Pyramids, the Great Sphinx, and the various obelisks which have become familiar to us in Cleopatra's Needle and other monoliths, to be erected in the midst of a desert of sand. Owen stone, so called after the inventor, is prepared by a mixture of sand of the Bagshot variety, which exists in large quantities in the neighbourhood of the works, and lime, the mixture being effected by a carefully regulated process, and subsequently submitted to hydraulic pressure in specially constructed cylinders. The process occupies about three days from the packing of the cylinder to the withdrawal of the moulds. Time alone will show whether the imitation will stand the same wear and tear which the natural product has survived, and it would be unfair either to praise or to condemn the output of the invention which was submitted to inspection, but this much may be said, that, comparing the Owen stone with previous imitations, it shows a closer grain and a greater facility for working which should commend it for building purposes. It is said to cost much less than Portland stone, and to have less tendency to splinter. Extreme changes of heat and cold have been tried on it without producing any appreciable results.

TRAMWAY CONSTRUCTION.

The Secretary of State for Foreign Affairs has received a despatch from Her Majesty's Consul at Bilbao, reporting that the Provisional Board appointed in connection with the electric tramway which it is proposed to lay from Zumarraga to Zumaya, in the province of Guipuzcoa, invite plans and tenders, to be received by February 28th, for the construction and equipment of the line. Further particulars of the conditions of the tenders for the above-named tram line and branch, which together measure thirty miles, may be inspected at the Commercial Department of the Foreign Office any day between the hours of 11 and 6.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN.—Accepted for school and teachers' house, Banchory Devenich, Aberdeen:—
Masonry.—Jas. Reid, Banchory Devenich, Aberdeen.
Carpentry.—R. Thompson and Sons, Bourtreesbush, Aberdeen.
Slating.—George Currie, Aberdeen.
Plastering.—Alex. Ross, Aberdeen.
Plumbing.—J. F. Anderson, Aberdeen.
Painting.—D. M. McLennan-Oults, Aberdeen.
FOLKESTONE.—For the supply of 1,000 yds. super York stone paving flags, for the Corporation. Mr. John White, Borough engineer, Town Hall, Folkestone.
Thos. Turner & Sons Es. Od. L. Somerfeld 7s. 5d.
Wm. Griffiths 7s. 10d. Saml. Trickett & Sons 7s. 6d.
J. Brooke and Sons 7s. 5d. A. and F. Manuelle 7s. 6d.
The Southwam Stone Co., Ltd. 7s. 4d. Bradford 6s. 11d.
* Accepted.

HAMPTON-ON-THAMES.—For the erection of a pair of semi-detached villas, Nursery-road, for Mr. J. J. Draper. Mr. F. G. Hughes, architect, Hampton-on-Thames:—
J. Singleton & Sons £1,128 0 J. Richardson 1,060 0
D. McDonald & Sons 1,080 0 J. Wright, Hampton* 830 0
H. March 945 16
* Accepted.

HANDY CROSS (near Gt. Marlow).—For erecting a new hotel for Messrs. Thomas Hughes and Sons. Mr. Jas. H. Deacon, architect, Gt. Marlow:—
W. Harding 2,895 0 0 H. Harris 2,761 12 6
W. Lunnon 780 0 0 J. S. Carter* 697 0 0
* Accepted.

HERTFORD.—For paving, metalling, channelling and lighting Railway-place, for the Hertford Corporation. Mr. J. H. Jevons, Borough Surveyor, Hertford:—
Cathy 2,518 11 Norris 4,470

KIRBY MUXLOE (Leicester).—For the erection of six houses and outbuildings. Messrs. Miles and Beasley, architects and surveyors, Friar-lane, Leicester:—
Urban Gurney, Leicester (accepted) £1,200

LLANDRINDOD WELLS.—For the extension of the sewerage system, for the Urban District Council. Mr. H. L. Bamford, surveyor, Hereford:—
Ford and Hudson, Coal. John Langford* 2,830
vile* 410
* Accepted.

LLANGUNEOCKE (Wales).—Accepted for additions, &c., to school buildings, for the School Board. Mr. W. Watkin Williams, architect, 63, Wind-street, Swansea:—
Dd. Rees, Ystalyfera £1,306

LITHERLAND (Lanes).—For completing Seymour-road for the Urban District Council. Mr. W. B. Garton, surveyor, Sefton-road, Litherland:—
Keating and Sons 288 12 2 Executors of W. F. Chaddock 262 6 0
Peter Palmer 69 0 0 John McCabe, South- 262 6 0
Thos. Horrocks 642 13 11 port-rd., Ormskirk* 579 9 6
Surveyor's estimate, 464 8s. 6d.
* Accepted.

LONDON.—For erecting new general offices for the Metropolitan District Railway Company at the St. James's Park Station, Westminster. Mr. Henry L. Florence, architect:—
Quantities by Mr. James Francis Bull £15,486
Colls and Sons £18,500 Kirby and Gayford £15,416
John Mowlem and Co. 15,000 W. Cubitt and Co.* 15,416
Ash y and Horner 15,788
* Accepted.

LONDON.—For heating Rutland-street School, for the London School Board. Mr. T. J. Bailey, architect:—
G. Davis 2,800 0 H. C. Price Lea & Co. £140 0
Strode and 187 0 Vaughan and Brown, 146 0
W. G. Cannon and 160 0 J. Esson 145 0
Sons 158 10 J. F. Clarke & Sons* 134 0
Stevens and Sons
* Recommended for acceptance.

LONDON.—For the rebuilding of manufacturing premises at No. 87, City-road, E.C., for Messrs. Sheath Bros. Mr. Alfred J. Martin, architect, No. 386, Old-street, E.C. Quantities supplied by Messrs. Heells and Wrightson, surveyors:—
Heaps 22,395 5 Scrivener & Co. 22,112
Dearing and Son 2,313 Regent's Park* 22,112
Stimpson and Co. 2,307 Chessum and Sons† 2,096
Jarvis and Sons 2,276
* Amended tender accepted. † Withdrawn.

LONDON.—For the erection of bath-rooms, the provision of fireproof staircases, &c., and generally repairing and re-decorating Nos. 28 to 60 (inclusive), Sidney-road, Homerton, to adapt for children's homes, for the Guardians of the Hackney Union. Mr. W. A. Finch, architect, 76, Finsbury-pavement, E.C.:—
Lambie 23,493 Barrett and Power* 23,387
Freeman and Son 3,400 Silk 8,253
Harris 3,397 Irwin 8,027
West 8,839
* Accepted.

LONDON.—For pulling down and rebuilding "The Royal Oak," Bromley-by-Bow, E. Messrs. Foulsham and Herbert Riches, joint architects, 3, Crooked-lane, King William-street, E.C., and Bromley-by-Bow, E.:—
P. Hart £1,530 T. Osborn and Sons £1,285
S. Salt 1,843 J. Edmunds 1,280
A. J. Sheffield 1,290 J. T. Roby* 1,253
* Accepted.

LONDON.—For heating Haseldine-road School, for the London School Board. Mr. T. J. Bailey, architect:—
G. Davis 2,190 0 J. and F. May 239 10
Purcell and Nobbs 1,745 0 J. C. J. Ellis, Ltd.* 510 10
NEATH.—For the erection of schools, Herbert-road, Melncrythan, for the Llantwit Lower School Board. Mr. J. Cook Rees, architect, St. Thomas-chambers, Church-place, Neath. Quantities by architect:—
Lloyd Bros. £6,344 0 0 Beynon, Thomas, and Rees £5,788 10 0

DECEMBER 22ND, 1897.

MODERN SANITATION.

By H. A. SAUL.

(Continued from page ix.)

No. VI. — ANTI-SYPHONAGE.

THE accompanying diagrams (Figs. 1 and 2) are intended to be explanatory of the clause from the London County Council bye-laws which terminated the last article, and which related to the ventilation of the traps of w.c.'s which were in connection with other w.c.'s.

Fig. 1 is a section through the outside wall of a building, showing the w.c.'s on two floors connected to the same soil pipe without ventilation to the traps. This was once the usual arrangement, and is so still in many instances, with the following very frequent result. When the upper closet has been flushed, the matter driven into the soil pipe assumes a bulk somewhat as at *a*. This, in its passage across the junction of the branch from the lower w.c. B, syphons out some of the air from the branch, causing the water seal in the pan to be forced in by the natural pressure of air from without, to a level below the dip of the trap, as at *b*. The better the flush from A, the more serious are the consequences to B. Hence arose the necessity of providing a vent through which air might flow to satisfy the demands of syphonage and leave the water seal undisturbed. Such vents are now made to nearly all forms of w.c. apparatus in one piece with the top of the outgo of the trap, as at *c*.

Fig. 2 shows the same w.c.'s, but with the addition of the proper ventilating arrangements. The ventilating, or, as it is more frequently—for the sake of better distinction—called, the *anti-syphonage pipe*, may be carried up through the roof independently of the soil pipe, or may be connected therewith at its upper part, as may be considered most convenient, although the latter method is usually found to be possible, and is more economical than the former.

If this pipe be considered merely as an anti-syphonage, the connection with the trap of the upper w.c. may seem superfluous, as its position gives it an immunity from syphonage owing to the open top of the soil pipe. It must not be looked at entirely from this point however, but also as a ventilator of the branch pipe between the apparatus and the soil pipe, acting in the same way and for similar reasons as the vent of the sink waste described in Article 3.

It is a common practice to cause the wastes from baths, lavatory basins, &c., situated upon the upper floors, to discharge into an ordinary

rain water head, and inferentially this method is the one which was adopted with the small houses which have been already considered. Although this is all that can be usually afforded in property where cost is a great consideration, it cannot in any way be considered as ideal, as soapy water soon renders pipes more or less foul, and it is rarely possible to place the rain water head so far from a window, that smell—which if not absolutely dangerous, is not to be desired—shall not be able to make itself known through an open window. Besides this, it is almost impossible to arrange the waste so as to avoid splashing, which often accumulates into an unsightly mess upon the r.w. head and the wall. But the greatest trouble is experienced in frosty weather, on account of the openness of the connections, when the ends of the waste pipes become frozen up, or the head becomes filled with a solid block of ice overflowing with icicles, as may so frequently be seen during a severe winter.

The method in best work, therefore, is to treat the vertical waste-pipe in the manner of a soil-pipe, i.e., to carry it up of its full diameter above the eaves of the roof as a ventilator, and to cap it with a wire dome or other protector (see Fig. 3). The waste-pipe from bath or basin would be connected with a wiped joint if the vertical pipe were of lead, or with a brass ferrule if of iron. The connection of the foot of the down pipe with the gully would be as has been already described, the method most to be preferred being with the back inlet of the trapped gully; but if in a district where the bye-laws so require it, to the end of an open channel communicating with the gully. This would probably be insisted upon by the sanitary surveyor, no matter how great care had been taken to render the pipe thoroughly well ventilated.

The question of syphonage must also be considered in relation to waste-pipes where a bath, lavatory, or sink, is situated upon a floor above another bath, lavatory, or sink, and communicates with the same pipe. It need not always be necessary to continue a separate anti-syphonage pipe up in the same manner as from w.c.'s, particularly if the horizontal waste is of short length. The pipe may be taken from the top of the trap and out through the wall as shown at *d* in Fig. 3.

THE END.

The slums of London are disappearing one by one, and among the latest that is now under sentence is the maze of narrow, tortuous, and filthy streets at the back of Limehouse Church. The Local Government Board has ordered a survey of the district.

HARBOUR CONSTRUCTION.

ADMIRALTY PROJECT AT DOVER.

THE Admiralty harbour which is about to be constructed at Dover is of great national importance, inasmuch as it will possess

FIG. 1.

a capacity more than sufficient to provide shelter, anchorage, and coaling facilities for the whole of the vessels comprised in the Channel Squadron. The original estimate of cost of £2,000,000 has been raised to £3,500,000.

The works to be undertaken, embodying in the main the proposals of the Royal Commission of 1844, consist (says the Times in a special article on the subject) of (1) an extension of the existing Admiralty Pier in an east-south-east direction for a distance of 2000ft.; (2) the erection of an east arm extending seaward in a south-westerly direction for a length of 3320ft. from the foot of the headland, at a point situated 200 yards to the eastward of the south-east angle of the convict prison enclosure; (3) the construction of a break-water 4200ft. long, which, at a distance of about three-quarters of a mile from the shore, will form on the south the outer sheltering arm of the harbour; and (4) the building of a sea-wall 3850ft. in length, extending from the Castle Jetty at the eastern end of East Cliff Terrace to the root of the proposed east arm. For the purposes of this wall a reclamation will take place, covering an area of twenty-one acres, the foreshore between the back of the

secured, no less than 315 acres will be situated beyond the five-fathom line, and the anchorage will be sufficient to accommodate twenty first-class battleships, as well as numerous torpedo-destroyers, gunboats, and other vessels of smaller type. The new Admiralty harbour is, on the eastern side, to enclose and protect the commercial harbour which has for some years been in course of construction. As originally designed by Messrs. Coode, Son, and Matthews, the commercial harbour was intended to cover an area of fifty-six acres, but this will now be increased to seventy-five acres—first, by carrying the proposed Admiralty Pier Extension in a southerly direction 640ft. further seaward than was at first intended; and, in the second place, by similarly lengthening the eastern arm of the commercial harbour considerably beyond the point proposed at the outset. Consequently the water area comprised within the two harbours will be not less than 685 acres, giving to Dover the finest place of refuge to be found on any part of the British coast. Dover Castle will overlook the very centre of the Admiralty harbour, and the entire town will enjoy the advantage of the three enormous sheltering arms, two of which—the Admiralty pier on the west and the new pier on the east—will constitute

MAGNIFICENT PROMENADES

open to the general public. There will be two entrances to the harbour—one at the extremity of the eastern arm, the other at the end of the Admiralty Pier Extension. The former will have a width of 600ft. and a depth of 42ft. at low water of spring tides, or of 60ft. 9in. at high water of those tides, the rise of springs being taken as 18ft. 9in. The Royal Commission of 1844 suggested that the entrance on the eastern side of the harbour should be 150ft. wide, with a depth at low water of 28ft. Such a limited capacity would, of course, be utterly useless to provide for a very large proportion of the vessels which have been built to meet the requirements of modern warfare, and it would also be unsuitable for a considerable percentage of the steamers and sailing ships now engaged in trade. Hence under the present design it has been decided not merely to carry the eastern arm much further seaward than appeared to be necessary to the naval experts of half a century ago, but to make the east entrance exactly four times as wide as, and deeper than, that contemplated in 1844. The south break-water, which will not be accessible to the public, will begin at the southern angle of this entrance, proceeding first in a curve trending in a south-westerly direction, thence following a straight line west by south, and terminating at a point 800ft. from the end of the Admiralty Pier Extension. A second, or southern, entrance, 800ft. wide, will thus be formed between the south breakwater and the Admiralty Pier Extension, the depth therein corresponding with that of the eastern entrance—namely, 42ft. at low water of spring tides. Although, as explained, the arrangement of the sheltering works now decided upon has been brought into general conformity with the recommendations of the Royal Commission of 1844.

IMPORTANT MODIFICATIONS IN DETAIL

have been rendered necessary in working out the design of the new project. These consist, first, in the provision of what is technically known as an overlap at the southern entrance, created by carrying the Admiralty Pier Extension in a more southerly direction than was formerly intended, the object here in view being to cover the western head of the south breakwater for a distance of 640ft. In the absence of such an overlap, it would have been extremely difficult, if not indeed absolutely impossible, for heavy and powerful ships in Her Majesty's Navy either to enter or leave the harbour during the period when the east-going current attains its maximum velocity of nearly four knots. The engineers who are responsible for the design which has been approved are satisfied that, had the western entrance been constructed as proposed in 1844, with a width of 750ft., an interval of not more than two minutes would have been sufficient for the action of the current to cause the

drifting of a vessel across so as to obstruct the entire opening. But by reason of the overlap referred to, any vessel belonging to the British Navy will always be able to enter the harbour by this entrance in comparatively slack water, the projection seaward of the head of the Admiralty Pier Extension beyond the western

FIG. 3.

wall and the base of the existing cliffs being filled in with chalk quarried on the spot. Thus

THE WORKS TO BE EXECUTED

represent a total length of 13,370ft., or more than two miles and a half. The area enclosed will be 610 acres at low water, or fifty acres more than would have been obtained by adopting the recommendations of the Royal Commission of 1844. Of the water area now to be

FIG. 2.

end of the south breakwater being in excess of a vessel's length. Another important advantage will be derived from the provision of this overlap, in the shelter thereby afforded during south-westerly gales to vessels approaching or leaving the harbour by the west entrance. A further feature of improvement upon the old scheme will be the increased sheltered area obtained within the harbour, which, owing to the general correspondence in the depths along

THE LINES OF THE PRESENT DESIGN

as compared with those in that of 1844, will not add materially to the cost of the undertaking. Berths for coaling purposes will be provided for a length of 1800ft. along the inner side of the east arm, the comparatively shallow area indicated on the plan being dredged down so as to maintain a uniform depth of 30ft. at low water of spring tides. The reclamation between East Cliff Terrace and the east arm will be used as a workyard during the construction of the harbour, and although its subsequent purposes cannot yet be definitely stated, it will at all times be available in connection with the work of coaling Her Majesty's ships of war. Each of the three main sea works will be a solid structure of enormous strength, consisting of concrete blocks, faced with granite above low water. The blocks used in the Admiralty Pier Extension, where the greatest sea pressure has to be resisted, will, as a rule, weigh forty tons, while those employed in the formation of the east arm and the south breakwater will be thirty tons in weight. All the blocks will be bonded and keyed, or joggled

together, so as to render the work monolithic in character; and in every case the foundations will be carried down to the solid chalk or flint composing the bed of the channel. The

MAGNITUDE OF THE WORKS

here briefly described may be gathered from the fact that the new structure henceforth to be known as the Admiralty Pier Extension will, measured from the base of the wall to the top of the parapet, be upwards of 90ft. in height, of which nearly 70ft. will be under the level of high water of spring tides. In view of the very exposed character of the site, the engineers have, in the design, taken special precautions to meet sea risk, both during the construction of the works and after their completion. The deep foundations will be carefully and completely protected from erosion arising from current action by aprons of concrete blocks laid and incorporated in the sea bed. The tender of Messrs. S. Pearson and Son, Limited, has been accepted by the Admiralty, and the works — which it is calculated will occupy about ten years in execution — will be under the direction of Major Henry Pilkington, C.B., R.E., the civil engineer-in-chief appointed under the Naval Works Loan, and of Messrs. Coode, Son, and Matthews, the chief engineers, by whom the design was prepared. The East pier, which is intended to form part of the commercial harbour, is making good progress. With the exception of the surface-paving, the viaduct portion has been practically completed by Sir John Jackson's staff, and the solid portion of the masonry, or outer part of the pier, has been laid for a length of about 1100ft. It is estimated that the remainder of the works comprised within the enlarged design of this commercial harbour must occupy three years longer, so that the commercial harbour will not be ready for use before the end of 1901.

THE London County Council, on the recommendation of the Main Drainage Committee, has decided to expend £60,000 on the construction of a new pumping station at Lot's Road, Chelsea, for dealing with the flow of the low-level and Counter's Creek sewers, and relieving them in times of heavy rains.

RECENTLY an ancient urn was picked up from a sandy knoll on the farm of West Skichen, Carmyllie, near Arbroath. It was lying near a dyke, and was just protruding from the ground. The urn is of earthenware, hardly larger than a breakfast cup, neatly formed, and quite entire. It was forwarded to Dr. Joseph Anderson, of the National Museum of Antiquities, Edinburgh, along with a request that he would give his opinion about it. Dr. Anderson has replied:—"It is a sepulchral urn, and of great interest from its being the smallest of its shape that I have yet seen." It belongs to the Bronze Age—that is, the archaeological period which preceded the Iron Age and began after the use of stone tools had died out, and lasted in Britain till within a few centuries of the Christian era. The cup, therefore, is at least a century or two older than the Christian era—say 2000 years on thereby.

Surveying and Sanitary Notes.

THE experiment which is being tried at Knostrop is similar to that which Mr. Dibdin has for some time past been engaged in carrying out at the Northern Outfall Precipitation Works, under the direction of the Main Drainage Committee of the London County Council. A one acre coke-breeze filter is used, and at the London outfall, between September, 1893, and November, 1896, as many as 500 million gallons of effluent were filtered. The effluent which was passed on to the filter contained, on an average, seven grains of suspended matter per gallon, so that a quantity equal to 2232 tons of sludge, of 90 per cent. of moisture, was entirely removed, the filtrate containing practically no suspended matter. In the case of the experiments at Sutton Mr. Dibdin has employed burnt clay, instead of using coke breeze as in Leeds, the results being equally satisfactory. A short time ago Mr. Dibdin described the experiments which he has carried out in London and Sutton to a meeting of the Institution of Civil Engineers. In his paper he claimed that by the adoption of such a system the question of sewage purification is placed on a different footing, and the necessity of costly sewage farms is entirely obviated. The results are, he says, completely under control, and filters can be arranged and worked to suit all requirements. He pointed out, however, that unless the process is carefully watched, risk of failure will be incurred, but when once the filter is fairly started and worked systematically little fear need be felt that it will go wrong. The filter, in fact, is a delicate organism, and requires, according to Mr. Dibdin, as much care and attention as any piece of machinery. It does not require constant renewal or alteration, but, like a good engine, requires watchful care to enable it to give the best results.

THE Western Branch of the Sanitary Inspectors' Association, of which the Right Hon. C. Seale-Hayne, M.P., is the president, met at Newton Abbot recently. The president, in the course of his address, said sanitation as an art was not of very great antiquity. Amongst the ancient Jews the Mosaic law was to a very large extent a law dealing with sanitation. The Jews had in the Mosaic law regulations imposing the strictest cleanliness, providing for the isolation of the sick, and for wholesome meat and drink. Those regulations were certainly not without their advantage, because during the whole of the Middle Ages, when Europe was frequently decimated by greivous epidemics, the Jewish race were remarkably free from the epidemics, which was undoubtedly due to their superior cleanliness as compared with the general dirt that prevailed. The old Romans undoubtedly understood sanitation to a great extent. Those who had read Viruvius knew how thoroughly well he was acquainted with the best sanitary position of the building, and how well he was acquainted with the best

materials, having sanitation in view, to put into that building. But, perhaps, the Romans developed their sanitary ideas chiefly in the provision of an ample supply of pure water for their towns. Those who travelled in Europe to-day were aware how at most of the chief Roman towns there existed magnificent works in their aqueducts, showing that they spared no expense or trouble in providing their inhabitants with what was more necessary, perhaps, than anything else—pure water to drink and for washing purposes. In those days sanitation was an art based on experience. Now it has risen to the dignity of a science based on a knowledge of the reasons of the facts they were seeking to produce. Nevertheless they must not be too sure that they had got to the bottom of the matter, and knew everything. They had had at Maidstone a lamentable example showing that they had yet a great deal more to learn. It had been calculated that the increased room provided in their model lodging-houses for the working classes gave on an average no less than ten years more life and ability to work to working men.

THE Local Government Board has held its first official inquiry into the merits of the septic tank system of sewage disposal. The system has been experimentally worked for nearly two years in the treatment of a part of the sewage of Exeter (from a population of about 1500 persons out of a total population of about 37,000), and Major-General H. D. Crozier, R.E., and Dr. Theodore Thomson, who were sent down by the Local Government Board, heard the testimony of a large number of eminent bacteriologists, chemists, and sanitary engineers from all parts of the country as to the satisfactory and economical working of the septic tank system in the disposal and purification of sewage. Exeter was one of the earliest drained cities in the kingdom, and has been the pioneer in using the septic tank system (which is a system in which the sewage is in part entirely consumed and the rest purified by bacteria) devised by Mr. Donald Cameron, the Exeter City Surveyor. The Local Government Board up to now refused to sanction any loan for sewage disposal works which did not make provision for land filtration, and declined to consider the Exeter scheme unless land filtration was included in it, so that this had to be done to please it; but the inspectors found themselves in a position of listening to a proposal for an entirely new departure in the method of treating sewage without having anyone before them to oppose the new scheme or defend the Board's favourite "sine qua non" of land filtration in comparison with it. The septic tank system was not so much on trial as the Local Government Board, which will, no doubt, in due time receive the report of its inspectors. It is the expressed intention of a large number of cities, towns, and rural authorities, so soon as the Local Government Board shall have seen fit to withdraw its exclusive patronage of land filtration, to follow one or other of the systems evolved from the Exeter plan.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

WITH SURVEYING AND SANITARY SUPPLEMENTS

An Architectural Causerie.

In turning over the **Aberrations.** leaves of some ancient album it is with quite a start that one comes upon a faded portrait of the lady who was once very near being Mrs. Brown. How was it possible, we muse, that one could have been thrall'd by such second-rate charms as these! Making every allow-

—not so very remote—when one wasted the precious hours in writing nonsense in lines of equal length, with rhymed endings, and really thought that this ill-favoured, homely, silly girl was another Helen of Troy. To take another instance, let us stroll through one of the sumptuous picture galleries which we owe to the munificence of the modern connoisseur. In some neglected corner one comes upon a picture which calls up memories of our youth. One sees the eager crowd which all day long surrounded it when displayed upon the Academy's walls, and the two burly policemen who guarded the priceless treasure start into life. One can even hear their never-ceasing appeals, urging, unavailingly, the lagging, gaping crowd to "move on." And now how poor a thing it seems! We can find nothing to admire in the crowded canvas, with its cheap sentiment and its too artificially "composed" groups and incidents. Was it not Butler who speculated upon the possibility of a whole nation going mad? Certainly a great part of the nation

overlook the broad walk. He will stare and gaze, and ask in wonderment and despair whether in A.D. 1860 this sort of thing was really considered high—nay, the very highest—Art. If he turns to the professional journals of the period he will find that the delighted writers could scarcely find words in which to express their admiration for this latest embodiment of their newest gospel of Art. And now "how abhorred in our imagination"! The kindest thing would be to clear it away and blot out and destroy all record of its existence. Will our buildings—those which we praise with such abundant rhetoric—stand the test of time, or will our immediate successors treat our works as we treat those of our immediate predecessors? Very likely—modern architectural fame is very short-lived. If we would keep a permanent place in the esteem of posterity we must base our works on those models which have stood the test of ages. This is a doctrine which is fatal to originality. Perhaps so. Originality is very well in its

ROOF SCREEN IN

ance for the frumpiness of an obsolete costume, what could one have seen in those commonplace features, and that insane simper? One remembers now the shortcomings which passed unnoticed then, and with riper experience sees too clearly those indications of approaching *embonpoint* which became, in after years, so very pronounced. It is scarcely credible that there was a time

were very near losing their wits over this and other pictures of its day. And the architect is not exempt from these "spirits" of time. If he thinks, that he is now at last on the right tack let him reflect that others before him were equally cocksure. And as a corrective to pride, let him walk through the Christ Church quads and seek out the range of modern buildings which

way. But the modern buildings which keep their hold on the public taste have nothing original about them. And those buildings which pretend to the greatest originality—we forbear to particularise—are the first to pall. Whatever differences divide us in politics, there is in Art only one saving creed, and that is the Conservative. Progressiveness in Art has heretofore led "no whither." E. I. B.

The Dangers of Draughtsmanship.

THE truism that every virtue has a parallel vice is generally accepted; and equally certain is it that the possession of any gift carries with it the possibility of its abuse. Hence we find a world littered with "pot-boilers" from all branches of Art, and the desecration of talents which are bartered for applause, position, money, and so forth—prizes which can always be obtained by a suitable pandering to popular taste. All this is very vulgar, very horrid, but, at the same time, no one is probably more alive to the fact than the gifted man, who deliberately sells his birth-right for his particular mess of pottage, thereby becoming a tradesman, and forfeiting his claim to the title of artist. There is, however, a far more subtle danger than this, which assails every executant of an Art, and which often enough prevents his ever becoming an artist in the true sense of the word. The danger lies in the prominence given to the method employed in expressing an Art, rather than to the Art itself. If we apply this general statement to our particular province, we shall see how architectural design suffers from draughtsmanship. Nearly every architectural student, before he has finished his articles, has had inoculated into his being the primary importance of excellent draughtsmanship. He has probably been soaked with South Kensington principles for years, and has with infinite pains and perseverance shaded and stumped from the plaster caste, passed several quite useless examinations—in fact, done everything, according to his lights, to make himself a competent draughtsman. After his articles are completed he finds that, to secure a berth in a good architect's office, draughtsmanship is all important—design is not required. He studies the building papers and competition designs, or perambulates the architectural room at the R.A., only to find that it is the clever draughtsman who is everywhere prominent. There is the water-colour artist who is employed by the architect to beautify a somewhat commonplace design by a wealth of colour, or a mystery of atmosphere, anything, in fact, extraneous to the legitimate purpose of the drawing. Then there is the perspective specialist in black and white, who manages to make a most effective composition with hollyhocks and hedges, swallows and sunbeams, bushes and brambles, and a building as an afterthought manipulated somewhere into this very pretty picture. Little wonder that the student should devote himself more closely than ever to draughtsmanship, when design plays such a subordinate part. Little wonder that as he grows older he should be satisfied with commonplace details which he has drawn so beautifully, or pretentious designs which on paper he has rendered so effective. How quaint and picturesque is the drawing of this half-timbered house with its broken ridge and impossible shadows, and how cruel is the awakening when the actual building in its prim modernity is finished. As long as draughtsmanship, however excellent, is placed before design, this false state of things must continue to exist. It is not Art to cover up a vulgar mantelpiece with beautiful drapery, and it certainly is not Art to cover up a design with draughtsmanship. An architect's object in life is to design, and with this object in view he must cultivate everything helpful to design; but the composition must always be first, the execution must be subordinate. How delightful would it be if every young architect realised the importance of the motto of the Architectural Association—"Design with beauty, build in truth."

H. S. M.

Art Education.

THE last decade has shown a marked alteration in the system of education. The old path of pupilage is forsaken for the new one of the schools. Each system has its advantages as well as its drawbacks. Art is a curious thing. You cannot teach it by routine. It does not lend itself easily to set speeches or formulas of expression. It is not to be learnt from books, though some may help. It seems to need the touch of personal intercourse between man and man, the play of mind on mind, the breath of a living and glowing enthusiasm. The position of the favoured pupil of the genuine artist is to be envied. To live and work with such a man long enough to understand him and his ways of thought—this is to have a chance of learning something from him. We do not wear our hearts on our sleeves; to be over-reserved was ever a national failing. The inner secrets of Art are only discussed in the rare moments of confidence between man and man. They do not lend themselves to the formal air and pompous diction of the lecture theatre, or to the restraint of the class-room, where teacher and taught are comparative strangers. To serve an apprenticeship to a genuine and accomplished artist—yes! But how if he be neither genuine nor accomplished, and fond but foolish parents have paid dearly for the privilege? This is the fate of many, of far too many for the credit of Architecture. If philosophers were kings, the problem of government would be solved; if all practising architects were genuine and accomplished there would be no problem of education; but the reverse is notoriously the fact, and we do our best with the schools. This best is, at present, but a poor best; more could be done, ought to be, and will be done. But on what lines? Is not the teaching at present too fragmentary, too much lacking in system, too much a matter of isolated facts? Are not the schools regarded as supplementing the knowledge obtained in an office? when really the office should be regarded as supplementing and completing the knowledge obtained in the schools. The schools can teach how a thing ought to be done; in the office may be seen how a thing is done; how near it is possible, in practice, to come to what ought to be. You cannot discuss first principles when you are in a hurry; you cannot explain your reasons in the rush of a competition. A dozen different reasons, of finance, of bad site, of client's instructions, may force you to do a thing in a way which is not the best; but is it always explained to the pupil. Does he not go away thinking this is how it ought to be? In the schools these matters could be discussed, the best way shown, the reasons given; a general knowledge of Architecture could be learnt; afterwards, in the office, it would be seen how this knowledge is applied to the practical affairs of life. Why are the schools content with the evening hours, the leaveings, the odds and ends of the student's time? They will never do what they might do while this arrangement holds. Do they take themselves seriously, and expect other people to, or are they only providing a pleasant way of spending an evening to those not socially inclined? If they have anything to say that is worth hearing, it is worth while to give up time in which to hear it. How much better if the student went first into the schools, all day and every day; how much wasted time might be saved when he afterwards went into an office. What is now learnt in ten years might, by better management, be learnt in five; and life is very short.

A. R. J.

CHICHESTER CATHEDRAL.

THE WEST FRONT THREATENED.

THE case of Chichester Cathedral, which is now threatened by the Vandals, is, in one sense, far worse than that of Peterborough, though in another sense far less bad. It is far less bad in that there is no question at Chichester of a superlatively beautiful work of Art, ranking among the wonders of the world of Architecture; but, says a correspondent of the Daily News, it is far worse in that the proposal is more absolutely wanton, no necessity being alleged, and far more vicious in principle. The actual scheme as put forward is to build a new north-west tower. At present the upper story of this tower, which flanks the west front, is a fragment; only the south wall abutting on the front existing above, while below is a chamber built in the seventeenth century, some say by or under the direction of Wren. Not 100ft. away, and effectually screening from the public road the fragmentary character of the north-west tower, is a detached campanile or Bell Tower, a MAGNIFICENT PRODUCT OF THE PERPENDICULAR STYLE,

extremely interesting from the fact that the Deans and Chapters of the past have pulled down nearly all the specimens formerly existing at Canterbury and elsewhere of these detached bell towers. It is now proposed to pull down the lower portion of the tower and rebuild the whole in a more or less exact imitation of the south-west tower, the lower portion of which is part of the original Norman cathedral, while the upper is thought to have been erected after the fall of the Norman upper storeys, in the time of Bishop Seffrid II., between 1210 and 1220. The cost is put at over £6000, and this is proposed to be done while necessary structural repairs, estimated at some £10,000, have not been done. The Bishop of Chichester, the other day, assured the world that the Cathedral authorities were not going to be Vandals or to build a sham tower. His utterance raises the whole question at issue in a very succinct form. "When," quoth he, "the north-west tower was built by Bishop Seffrid in the thirteenth century, was it a sham tower? Just what Bishop Seffrid did then the men of the nineteenth century were going to do now, under the direction of one of the most eminent architects of the day." But this is just what they are not going to do. They are going to do something entirely different to what Seffrid did. For what did Seffrid do? When the Norman tower partly fell down, he had it built up in the prevalent style, "Transitional," of his own day, a style that came naturally to the architect of the thirteenth century, and could no more be mistaken for that of the previous architect than Millais' style in painting could be for that of the eighteenth century. But the "eminent architect" does not propose to build

IN THE STYLE OF HIS OWN DAY.

If he did wish to do so, in what style would he build? In the Gothic, the Greek, or the Italian style? What says the Bishop? "It is intended to restore, as far as they could, line by line and stone for stone, the work which Bishop Seffrid did in the thirteenth century." In other words, the men of the nineteenth century are going to imitate the style of the thirteenth. Will not the result be as much a "sham"? But this is not all. It is proposed to put the new work alongside of, and in part above, the old fragment that still remains of the eleventh and thirteenth century tower. It is alleged that this will serve to support the west front, but in the opinion of experts, it will be found impossible to do this. The imposition of additional weight is almost certain to crush and destroy the old masonry. Besides, if the new work should be bonded in—and it must be if the work is to serve as an effective buttress to the west front—the settlement of the new work will drag down the old with it, and the result will be, if not the fall, inevitably the rebuilding of the old. If the new work is merely built up alongside the old, how will it help to maintain the old?

CARDIFF COMPETITION.

A SUPPLEMENTARY CRITICISM.

AMONG the faults in Messrs. Cooksey and Cox's plan for the Town Hall are the positions of the rates and weights and measures departments and the pay office, placed as they are on the south or main front, and entered off the carriage-ways into the Courts. These departments would have been more advantageously placed within the quadrangle, as the traffic to and from them would at times be great, and liable to congest the only approaches to other departments.

The architectural treatment of the porches and lavatory blocks projecting into the courtyard is also bad, and could be much improved by a flatter and broader type of projection being employed. The architectural breaks in the front elevation, also, have no meaning or use ultimately, but these and other defects are probably due to want of time and do not seriously militate against the admirable type of plan which takes a very high place for simplicity and breadth of treatment.

In the Law Courts block, however, very few of the essentials of good planning seem to have been considered. The two courts placed behind a central hall are separated from one another by the ante and Grand Jury Room which are connected with the Criminal Court alone, and effectually bar the arrangement of a central State entrance for the judges, who have to turn right and left along the length of the hall and up a long side corridor to their rooms. The Wreck Enquiry Court, administered by the stipendiary magistrate, is placed away from the Magistrates' Clerks' department and to the west of the Assize Courts; the Bar Robing Room, together with other rooms for the use of both courts is placed at one side of the building, and there are other mistakes as to leading points in the planning which entirely condemn it.

The Police Station has been planned without any regard to symmetry of its elevation towards the avenue, to which it presents an elevation as ragged and uneven as the back of a speculative builder's house, the whole plan rather suggesting a first sketch worked in than a finished scheme. The elevations, on the other hand, are charming, and would, if carefully finished, contrast favourably with either of the two first premiated designs. The central towers, flanked on either side by the broad masses of the Assize Courts, lit by large Roman windows, and the long, lower building in front, broken up with engaged columns and arched window openings, forms one of the most pleasing groups in the room.

Among other noteworthy designs is that of Mr. Mountford, who places the main rooms at the base of the building, and approaches the principal or first floor by an external flight of steps, which lead under a broad portico and up to a central hall, at each side of which are long areas with corridors running round, and lavatory block placed in the centre. At the eight angles of these courts are placed staircases. The elevations of this design are vigorous and dignified. Subordinate entrances are shown on the ground level.

Mr. Henman, of Birmingham, submits a design providing the rooms required round a circular court, which he proposes to roof over

(Our first criticism on the Cardiff Competition, together with illustrations of the first premiated drawings, appeared in our last issue.)

as a Town Hall. The staircases are placed in the four angular spaces. A large bulbous dome surmounts the whole, which is more suggestive of a theatre or music hall than a municipal building.

Messrs. Leeming and Leeming's design has a monumental appearance, and is a little suggestive of the Palais de Justice at Brussels. In its massing it is among the finest designs submitted. The police courts cover a larger area

carriage way in the centre of the north front. The Town Hall and Law Courts are shown connected with tower by an arcaded bridge or loggia, which, like the large central hall suggested in Mr. Henman's design, is to be a future addition or "extra." The architectural treatment of the whole is more adapted to a smaller building than one on the proposed scale. The design is among one of the most costly in the room from its size.

CARDIFF COMPETITION. BY MESSRS. GIBSON AND RUSSELL.

than most others in the room, as the whole of the accommodation has been placed on the ground floor, including cells.

Many of the remaining competitors have shown a detached tower standing centrally in the avenue between the Law Courts and Town Hall. This is the case with Messrs. Brewill and Bailey's design, in which the Town Hall is planned round one large quadrangle, with a

Mr. Seward, of Cardiff, sends in a design consisting of a front block with three wings in the rear, the centre of which forms the Assembly Hall, a connecting wing being shown as a future extension, but which, as it stands, rather suggests an asylum or infirmary than a Town Hall plan in which concentration and convenience of working, and not isolation, is to be aimed at. The elevational treatment is

undignified and commonplace, with a multitude of gables and other features, and not at all suggestive of its uses.

Messrs. Richards and Budgen submit the best of the remaining designs from Cardiff architects, which are, however, by no means remarkable for their merit.

Mr. Bran, of Croydon, sends in a rather pleasing design, which is suggestive of Mr. Webb's influence in its design.

No. 24 is by Mr. Cheers, and is rendered in an extraordinary manner, the tinted elevations being cut out and pasted on another sheet, on which trees and sky are tinted. Both this design and that by Mr. Chisholm would delight a land and estate agent, but are representative of a bygone age in architectural draughtsmanship, and illustrate very commonplace, mediocre designs.

Among other oddities in the room is the design numbered 38, in which the authors have thrown both Law Courts and Town Hall into a single building, through the quadrangle of which the avenue passes, some of the State rooms forming part of the bridge across the avenue; while No. 54 submits a detail which is suggestive of a pupil's first attempt, and which is more to be regretted, as the author has done some clever planning elsewhere, in smaller buildings.

The general criticism that one is inclined to make after a careful study of the designs submitted is that a far better result might have been obtained had the conditions been better and more thoroughly considered.

It must be admitted that the award of the first premium would have been more satisfactory had it been more in accordance with the conditions, and it seems hardly right that in a case of this kind, where designs for two buildings are asked for, that a design should receive a premium as in the case of the design placed third, of which one of the constituent buildings is not well planned. Would it not have been simpler to ask for designs for a Town Hall alone, and let the winner design Law Courts, or to have had two separate competitions, unless a certain standard of excellence in both designs is to be insisted on?

If on the other hand it had been left to competitors to arrange each building to front on the avenue, it would have been possible to plan a grand architectural group, and the different sizes of the two buildings could have been obtained by increasing the depth of the Town Hall while planning each building with an equal and possibly similarly treated frontage to the avenue. This idea has been partially carried out in the first premiated design, and it is clear that had it been known that such a solution was allowable many competitors would have been glad to avail themselves of the opportunity, for it is quite evident that only in this way, or by planning the two buildings as one block, can a really satisfactory result be obtained. As laid down in the conditions, it was proposed to place the two buildings, too far apart to form a group and too near together to be treated independently.

It is singular that with unlimited space at the disposal of the Corporation, this was not borne in mind.

As the old order changeth, giving place to new, it is greatly to be hoped that changes for the better will take place in competitive conditions, and that they may become simple, plainly-worded expressions of well-considered intentions, and not a tangle of suggestions, among which architects grope in the dark, as is too often the case now.

MATTERS ARCHITECTURAL AT LEEDS.*

BY GEORGE CORSON.

I NOTED in my first address the changes in the architectural aspect of Leeds since I first knew it in 1849. Specially I noticed one conspicuous building which had an industrial and political history, but was in other respects a blot upon the aspect of Leeds. That was the Coloured Cloth Hall. Fortunately, after many attempts, the Council succeeded in securing it, and the "Quebec" buildings adjoining, at a large cost. The site was cleared and a considerable portion sold to the Government, upon which to erect a post-office sufficient to meet the wants of Leeds. That building has now been erected, and includes not only accommodation for letter post, but also for parcel post, telegraph, and Inland Revenue. I am not by any means alone, however, in considering the front elevation to be a splendid opportunity lost, and in regretting that the architect of the post-office has not been able to rise to the occasion. But putting aside all questions of architectural merit, what a contrast is presented between the colossal building in City Square and the small and abject building at the foot of Albion Street, in which the postal business was carried on some twenty years ago, or more. The result of the formation of the City Square, in enhancing the value of the surrounding property, has been already exemplified in the recent sale of the old post-office site, in area about 666 yards if I remember aright, at £75 a yard, or nearly £50,000 in all. Certainly, of late, there has been a revival of the dead bones in the matter of street improvements and the erection of new buildings, partly in consequence of these. Without trenching upon politics, debarred in this Society, and in my opinion altogether outside of municipal business, I cannot help observing that within the last two years the slow revolving wheels of municipal progress have had an electrical stimulus given them which is very cheering to the hearts of those who have watched with impatience the tortoise-like and planless efforts of the City Council for so many years to bring about improvements in widening the streets and removing obstructions. I happen to have in my possession a plan for the improvement of Land's Lane, which Mr. Filliter, the then Borough Surveyor, some thirty years ago gave to me with the remark that the Council could not undertake so large a work; and he thought I might bring to pass an improvement from which the Council shrinks in dismay. That was fallacious, and Land's Lane remains now, with small exceptions, as it was thirty years ago. There are other examples in the City of delay in taking action in these matters which will occur to most of you. Prices of property, especially in business thoroughfares, are constantly increasing, and the Corporation has to pay now two or three times as much as would have been required twenty years ago. Let us hope that a younger and more hopeful spirit has been infused into the Council, and that the truth may be recognised that judicious improvements always pay for themselves in the short or long run. I will not enlarge upon the buildings which within the last twenty years have added to the architectural aspect of Leeds. Suffice it to indicate the Yorkshire Penny Bank, the National Provincial Bank, and the bank of Wm. Brown and Co. (now in course of erection), the Prudential Assurance buildings, the new Medical School, and the extension of the Infirmary buildings. So long as Leeds grows at the rate of 7000 a year, so long must its needs in every direction extend, and my successor in this chair twenty years hence will have, no doubt, ample scope in chronicling a greater Leeds. There are several directions in which a municipal government of Leeds may effect reforms in directions which on other occasions I have pointed out. The last Improvement Bill gave powers to the

Corporation to "regulate" hoardings and the placards with which they are covered. Nothing has been done in that respect. I think that a "regulation" might be made that no hoarding should be allowed that does not leave a space of, say, 6in. between each board. This would put a stop to the disfigurement of our streets by the advertising bills which now cover these erections. In France all such advertisements are taxed; they must have a stamp affixed of value according to the size of the bill. There is another way. Prohibit all trade advertisements displayed in public, except upon the building where the article is manufactured, or the shops where it is retailed. It seems to be forgotten that the people of this great city pass most of their lives in and about its streets, and that they are entitled to have their surroundings made as quiet, as orderly, and as comely as lies within the power of those whom they have elected to rule over them. Let me, before I close, quote from a book, which I have here, some remarks as to the cares and anxieties of our Profession, which will, I think, be heartily endorsed by all of you. The book is entitled "Remarks on Church Architecture," by the Rev. J. L. Pettit, published in 1841. Mr. Pettit has passed away, but his book lives, and I can recommend it as evidencing a love of Architecture and a skill in sketching which we do not often find.—"But let me not be thought to speak a word in disparagement of the professional architect. So great are the actual and inherent difficulties of his Art, and so grievously are they multiplied by external causes; so limited and restricted is he by the perverseness of others; so many conflicting tastes and opinions has he to consult; so beset is he, on every side, by the ostentatious views of one, the parsimony of another, the private interests of a third, and the overweening ignorance of the greater number, that it is a marvel his work should ever be respectable; and we cannot deny that many of our modern churches are extremely creditable to the taste and skill of their designers. Let those who speak of the labours of the architect with flippancy, or censure them with unkindness and severity, reflect upon the difficulties he has to encounter; of no other Art are the principles and beauties more deeply hidden in the treasury of Nature, and to be searched out with greater toil and diligence. The painter, the sculptor, the musician, finds his laws and models, as it were, on the surface; the proportions of form and the harmonies of sound are at once conveyed to his senses, and present him with sure and infallible elements. But where is the architect to look for his examples? The fretted arches and canopies of the living rock, the verdant aisles of the forest, the spiry pinnacles of the Alpine range, may afford him ideas of sublime grandeur, but can furnish him with no rules by which they are to be developed and arranged. That these are as fixed and immutable in their nature as the foundation whereon any other art or science is grounded, we cannot doubt for a moment; but how difficult does it appear to detect them, how impossible is it to enunciate or define them!"

SIR E. J. POYNTER, President of the Royal Academy, will open, early in the New Year, the new South London School of Arts and Crafts, which has been erected in Peckham Road, Camberwell, as a memorial to the late Lord Leighton, P.R.A.

A PUBLIC meeting at Cardiff has resolved to erect a memorial to the late Dean Vaughan to be placed in Llandaff Cathedral, and that it should take the form of a recumbent effigy of the late Dean. An amendment, that a memorial window of stained glass should be placed in the west front, was negatived.

A MEMORIAL tablet to the late Mr. George Richmond, R.A., has been placed in the crypt of St. Paul's Cathedral. The bronze medallion, with a life-like portrait in low relief within a wreath supported by two amorini with inverted torches, designed by Sir William Richmond, R.A., is mounted in a tablet of rosso antico marble adapted by Mr. John Richmond from an ancient altar figured in Mr. C. H. Tatham's work on classical ornament.

CARDIFF TOWN HALL AND LAW COURTS COMPETITION. BY MESSRS. GIBSON AND RUSSELL.

VILLAGE HALL AND CLUB.

ARCHITECTURAL COMPETITION AT BYFLEET.

THE drawings submitted in the Byfleet (Surrey) Village Hall and Club Competition have been on view to the public at West Hall, Byfleet, the residence of Mr. Stoop, who is providing the money for the erection of the new building, which, we understand, is to be a memorial of the Jubilee.

Mr. W. Howard Seth-Smith, the assessor, says in his report:—"As many as ninety-two sets of drawings have been received in response to your advertisement inviting competitive designs for this building. A large proportion show a high average of planning and design, and the best ten were so good as to require a good deal of consideration and comparison before I was able to report to you. I have no hesitation, however, in stating that the design under the motto of "Red Star" most completely fulfils the advertised conditions and other requirements of a village

hall, and should be awarded the premium of twenty-five guineas. The authors are Messrs. Ashley and Armstrong, of 50, Berners Street, London, W. I have made a calculation of the cost of carrying out this design, and consider that, with extreme care and economy in every detail, it may be realised, exclusive of all fittings, for a sum approximating to that stated in the advertisement. Several slight modifications will, however, have to be made in carrying it out."

It is very refreshing to record such a competition as this, which, like the one we recently

County Borough of Cardiff.

PLAN SHOWING FRONTAGE LINES FOR TOWN HALL AND MUNICIPAL BUILDINGS

CARDIFF COMPETITION.

noticed at Bethnal Green, has been conducted throughout in a perfectly open and straightforward manner; and where there can be no doubt as to the superior merit of the premiated design.

The site is charmingly situated in a level field, with none of the restrictions imposed by ancient lights of adjacent buildings to hamper the competitor.

The conditions, which were somewhat meagre, provided that the hall portion of the building should accommodate between 300 and 350 persons, with two dressing-rooms at the stage end; the club was to contain reading, committee, and billiard rooms. Two rooms for a caretaker were also to be provided. The cost of the building was not to exceed £1500.

The small amount of money to be spent necessitated a very simple treatment both as regards plan and elevation, a fact which a good many authors of otherwise excellent designs seem to have ignored.

Although no less than ninety-two sets of drawings were submitted, there are certainly not more than twenty which rise above the

necessary in a building of this kind. In the club part of the building, the reading-room, billiard-room, and lavatory accommodation are arranged on the ground floor, the committee room and caretaker's quarters are upstairs. One point open to criticism is the space accommodation for the caretaker, whose bedroom leads directly out of the kitchen, and who is without larder, scullery, or even w.c.

The clever water-colour perspective illustrates this design in a manner which the sketch accompanying this description must, of necessity, fail to do, although some idea can be obtained of the general character of the design. The materials employed in the elevation are red facing bricks for the ground floor, with a half-timber treatment above. It is a great pity that the authors should have introduced battlemented turrets into their simple elevation, and it is to be sincerely hoped that they will reconsider this quite inappropriate feature.

Messrs. W. F. Taylor and Son are "highly commended" for a very taking design. The plan is very similar to the successful one, with hall at side, and entrances to club and hall

all the best designs. The elevation is commonplace, whilst the half-timber treatment of the main gable is in the worst possible taste.

Another "highly commended" set of drawings is that by Messrs. Smith and Robinson, whose domestic design is far more suitable for a country house, a fault which applies to a large number of the designs submitted. Messrs. Paxton and Crouch, for example, have designed an elevation which would be admirable for the home of some medical practitioner, but has altogether missed the spirit in which a village hall should be conceived.

Mr. H. L. Fedden illustrates a quiet, red brick elevation with a pretty water-colour sketch, but spoils a well thought out plan with a bad entrance to the hall.

The design by Mr. C. H. B. Quennell is at first sight clever, but a careful study of the design shows many weak points. The author has adopted a T-shaped plan, having his hall at the back of the club, which necessitates the public going through the club premises before they can get to the hall, an arrangement which, although many competitors

BYFLEET VILLAGE HALL AND CLUB COMPETITION.

level of mediocrity, many being, indeed, beneath any serious criticism.

The premiated design by Messrs. Ashley and Armstrong distinctly earns the laurel wreath which we notice has been placed over their drawings; the plan is compact, simple, and cleverly arranged, whilst the elevation is, on the whole, quiet and well-proportioned, a combination not always arrived at by the other competitors.

The authors have placed their village hall on the right side of the club, but have arranged the public entrances both to club and hall in the front of the building, which is certainly a great advantage. Cloak-rooms and lavatories for ladies and gentlemen are placed on either side of the vestibule to the hall, additional cloak-rooms for artists being supplied at the platform end. The public entrance to the hall from the vestibule is through sliding doors, an arrangement which, of course, would not be permitted in a room for public entertainments. Beneath the windows at the side of the hall the authors have shown extra exit doors, to be used in case of emergency. Both the club and hall, although perfectly distinct, are in communication with one another, which is very

from the front. The perspective view is a charming little picture, perhaps more suggestive of a village inn than a hall, and lacking in that compactness which is exhibited in Messrs. Ashley and Armstrong's design. It is, however, extremely picturesque, and we should imagine that, if there had been a second premium offered, it would have been secured by this clever set of drawings.
